## Books of the Week.

18, 36, 53, 70, 92, 109, 127, 148, 164, 184, 206, 222, 240, 258, 275, 292, 314, 332, 348, 371, 393, 415, 434, 452, 470, 488.

### *ERRATA.*

Page 9, col. iii., line 12. For "Gnome" read "Gomme."

Page 22, col. iii., line 40 from bottom. For "1891" read "1861."

Page 102, col. iii., line 18 from bottom. For "Wachernagel" read "Wackernagel."

Page 108, col. i., line 6 from bottom. For "Miss" read "Mrs."

Page 177, col. iii., line 30. For "Wolkowski" read "Volkonsky."

Page 192, col. i., line 18. For "Charity" read "the Charité."

Page 249, col. i., line 10. For "Mrs." read "Mr."

Page 289, col. i., lines 39, 40. For "the successor of Renan in the College de France," read "brother of the successor, etc."

Page 320, col. ii., line 16. For "£140,000" read "£140,000,000."

Page 332, col. i., lines 4, 25. For "Pennebacker" read "Pennypacker."

Page 357, col. iii., line 27. For "Merpes" read "Menpes."

Page 385, col. ii., line 35 from bottom. Omit "Banks."

Page 428, col. i., line 12. For "Sanford" read "Sandford."

Page 460, col. ii., line 15 from bottom. For "father-in law" read "step-father."

# The Nation.

NEW YORK, THURSDAY, JULY 5, 1894.

## The Week.

THE prompt action of Attorney-General Olney in putting forth all the powers of the law to move the United States mails is worthy of the highest praise. It stands, too, in remarkable contrast to the John Sherman interview published in the Sunday newspapers, in which the Ohio Senator makes an attack on the Pullman Car Company as a grinding monopoly. That this interview is an encouragement to rioters and a text for anarchists is perfectly evident. If we had not been led by long experience to expect such summersaults from Mr. Sherman in critical times, we should think that he had suddenly gone crazy, "This matter has no reference whatever to the strike," he says. Hasn't it? With twenty-two railroads in the hands of rioters at Chicago and vicinity, with all the railroads on the Pacific coast similarly situated by reason of the Pullman boycott, does Mr. Sherman think that his attack on the company will have no bearing on the strike? He can hardly be so simple as that. The rioters will assume at once that Mr. Sherman is on their side, and the public will assume that he intended the result which will follow.

---

The matter of his talk is as devoid of logic as it is ill timed. He says that "the Pullman Company charges each railroad running its cars a cent a mile for every car, and this goes into the pockets of the Pullmans in addition to the rates paid by the passengers." This, as he puts it, is a great public grievance, as though the railroads did not know how to manage their own business, but needed Sherman or Debs to protect them against the extortions of Pullman. Another sad thing is "the system of tipping the employees." This, Mr. Sherman thinks, should be discontinued, but, reflecting that these employees also have votes, he adds that they "are not paid enough by the company; if they were paid adequate salaries, the passengers would not be expected to come forward to help them out." Poor passengers, poor porters! how they must thank Mr. Sherman for his statesmanlike efforts to go to the root of the trouble. Debs and his followers, however, seem to take more stock in Kyle than they do in Sherman, for they have telegraphed to their friends to support the Kyle bill to stop running Pullman cars on mail trains, and they have not rendered equal homage to Mr. Sherman's resolution to investigate sleeping-cars.

The man Debs who is managing the Pullman boycott has issued a manifesto, which is so much like the proclamations of Martin Irons in the great Southwestern strike that we could fancy that Irons was in control of the literary bureau. "The struggle with the Pullman Company," says Debs, "has developed into a contest between the producing classes and the money power of the country." That is a sonorous period. He then gives his version of the first trouble with the Pullman Company, but does not give any particulars. He deals with the matter in a broad, general way so as to palm off the largest number of lies without detection—again in the style of Martin Irons. For example, Mr. Pullman said that his company had taken a contract for 55 passenger cars for the Long Island Railroad at $300 per car less than cost, in order to keep the men employed, and that there was only 60 days' work in sight at any rate of pay whatever. Does Debs dispute this particular fact? Not at all. But he throws off another sonorous paragraph about the employees "mortgaging their bodies and souls as well as their children's to that heartless corporation." Then he tells how the Pullman strike became a general war against the railroads. By skilfully turning it around, end for end, he makes it appear that the railroads began it by insisting upon hauling Pullman cars. "The railway corporations," he says, "through the General Managers' Association, came to the rescue, and in a series of whereases declared to the world that they would go into partnership with Pullman, so to speak, and stand by him in his devilish work of *starving his employees to death.*" It is impossible that such lies should deceive anybody, but we shall probably have to cope with them in the old-fashioned way—that is, by delaying and expostulating and waiting for the rioters to gain strength and confidence till they begin to commit murder and arson, and then sending the militia to shoot them down and drive Debs into the seclusion of some liquor saloon, where Irons finally terminated his career as a Knight of Labor.

---

The test vote on the income tax in the Senate on Thursday proves those to have been right who have asserted that this tax was stronger than any measure of its class before Congress. No tariff law could be drawn which would alienate but four Democratic votes and would win ten Republican votes. That fully one-quarter of the Republican vote should have been cast for the income tax shows how idle it is to expect its repeal at the hands of the Republican party. It is only twenty-two years ago that, as Senator Teller pointed out, twenty-five Republican Senators went on record in favor of the income tax. Whether we like it or not, therefore, we must admit the cold fact that the income tax has come, and probably has come to stay. Recognized by economists as, theoretically, a just and even an ideal tax, it has cunningly been put into a form to give it the greatest possible strength with the masses of a democratic country. Their inevitable answer to all objections is that made by the chairman of the Maine Democratic convention the other day, who said: "Give me the income, and I'll not quarrel about the tax." The logical outcome of that answer is spoliation, but democracy is not careful to be logical, and property has immense power on the defensive. Meanwhile, it must be said that many of the crudities of the law as it passed the House have been clipped off in the Senate. The exemptions made in favor of savings banks, of mutual-insurance companies, and of building and loan associations break the force of the severest attacks made on the law.

---

It is becoming evident that the silver planks which are finding their way into the platforms of Republican State conventions are dictated by the congressional managers of the party in Washington. None of these deliverances has caused so much surprise as the declaration in favor of a "continued and extended use of silver in our circulation," which was made by the Republicans of Vermont, since the Green Mountain State is one which has never had the slightest sympathy with the silver craze. How did such a plank get into the platform? The Rutland *Herald*, a prominent Republican newspaper, says that it was not inserted in response to any sentiment in its favor among the delegates; on the contrary, it was read when members were hurrying from the hall to catch trains, and was neither considered nor even heard by the members of the convention. Moreover, the *Herald* declares that "it does not represent the Republican party belief in Vermont," and that "it actually misrepresents the home feeling." It declares its conviction that the proposed policy is not only wrong but foolish, and it believes that if the whole party goes that way, it will meet with disaster.

---

Senator Cameron wrote a terrible letter to the national convention of the Republican Leagues at Denver on June 26. It appears that "the world stands on the edge of revolution, social and political," but, strange to say, "every one shrinks from it." Well, what is

the revolution to be about? About "the struggle between gold and silver." Why is this "struggle" so alarming? Because "the single gold standard seems to be working ruin with a violence nothing can stand." "Almost the whole world," or, to speak more precisely, "nine-tenths of mankind," is of this way of thinking. Well, why does "almost the whole world," or "nine-tenths of mankind," submit to all this state of things? Why do they watch "gold working ruin with violence"? Why do they "stand on the edge of political and social revolution" and yet shrink from it? Simply because "the bankers of London have said that we must submit, and we have submitted." As Mr. Cameron well remarks, "So strange a spectacle has never been seen in our history." "Something," he adds, "then, must be decided, and quickly, for delay itself is likely to be decision." This bedlamite nonsense, according to the *Tribune's* special report, was received by the Western delegations with transports of enthusiasm. "They went fairly wild with joy." We admonish the business men of the country, East, West, and South, who last year forced the Sherman repeal bill through both houses of Congress, that the silver question is of far more consequence than any tariff question or any party question, and that they cannot safely withdraw their attention from it at any time.

---

It is risky business in these days to say a good word for either party as to its financial position. The Democrats of Pennsylvania on June 27 adopted a resolution on the money question which was so sound, and so fully in harmony with the traditions of the party, that it seemed as though the organization might be recovering its senses under the leadership of President Cleveland's administration, whose conduct was warmly endorsed. But the next day the Arkansas Democrats made a deliverance on this question which was simply shocking. The committee on resolutions reported a platform which called for "the free and unlimited coinage of both silver and gold at a ratio of sixteen to one." An amendment was proposed to substitute for this the words "free coinage without discriminating against either metal, upon such rates as shall insure the maintenance of a parity of both metals," but it was rejected by a vote of 359 to 92. Appropriately enough, after so unblushing a declaration in favor of cheap money, the convention treated with contempt another resolution endorsing the administration of President Cleveland. As he stands for sound money, praise from such a convention would have been hypocritical at best, and it is much to be preferred that the men who want to cheat their creditors should show exactly what they think about an official who stands for honesty. Even Michigan makes no better showing than Arkansas. The Democratic convention in the former State on Thursday declared in favor of free coinage "at a ratio that will permit the debtors to pay their debts upon the same basis in which they were contracted," and demanded that all the circulating medium be hereafter issued under the acts of Congress "and such amendments as the business wants of the country may require, and it shall be full legal tender." This is nothing short of calling for soft money in unlimited quantities. Where is this sort of thing going to end? Are both of the old parties destined to fall under the control of the silver fanatics?

---

New Mexico was all but admitted to the Union as a State twenty years ago. At that time the Republicans controlled both branches of Congress by large majorities, and they favored the admission of the Territory because they thought it would be carried by their party. In the Forty-third Congress a bill looking in this direction passed the House of Representatives by a vote of 160 to 54. The Senate was as strongly in favor of it, 32 voting for the bill and only 11 against it. But a slight amendment had been made by the Senate, which sent the bill back to the House, where the pressure of business in the closing days of the session enabled its opponents to block its final passage. But for this hitch New Mexico would now be a State of twenty years' standing. The House has now voted for its admission, as it has already done in the case of Arizona and Utah. When these are brought in, there will be forty-seven States and ninety-four Senators. These States contained in 1890 a population of 61,202,896. Seven of the forty-seven had in all less than three-quarters of a million, as follows:

| | |
|---|---|
| Arizona | 59,620 |
| Idaho | 84,385 |
| Montana | 132,159 |
| Nevada | 45,761 |
| New Mexico | 153,593 |
| Utah | 207,905 |
| Wyoming | 60,705 |
| | 744,128 |

In other words, less than one-eightieth of the country's population is found in this mountainous section, and yet these seven thinly settled States will have 14 out of 94 Senators, one-seventh of the upper branch.

---

Nor is this the worst of it. A majority of such a Senate would be 48, and here is almost one-third of that majority in the 14 men sent by this thinly settled region. On any question in which they have a common interest, as in mining, they need but 34 out of the remaining 80 to control the body, and half of these could be found in their immediate neighbors—Colorado, Nebraska, Kansas, and the two Dakotas on the east, and Washington, Oregon, and California on the west. In other words, the region west of the Missouri River, with only about six of the more than sixty millions, or one-tenth, will have 30 of the 94 Senators, or almost two-thirds of a majority. We say nothing about the character of the Senators from these new States. It does not look well for States which send Hills and Murphys, Quays and Camerons, to criticise the choice of others. We do not speak of the unsettling of the old order of things in the Senate as regards rules and traditions by so large an addition to its numbers. That can be arranged by a needed reform of the methods of procedure. But we can never deprive the sage-brush and mining-camp States of their equal representation in the Senate, when once they get it.

---

It is announced that the controversy over the World's Fair medal has been "settled" by the adoption by Secretary Carlisle of a "composite design"; Mr. St. Gaudens's original design for the obverse being allowed to remain, while the much offending nude figure on the reverse is to be replaced by a very "composite" design indeed, created by Mr. Barber, the designer of our present silver coinage. Whether such a preposterous "settlement" as this will be allowed to stay settled, remains to be seen. It does not seem to have occurred to the settlers that Mr. St. Gaudens might object, with some show of reason, in our humble opinion, to being bracketed in this way with a vastly inferior designer, and might insist on the Government's taking all of his design or none. The whole chapter of its dealings with this distinguished artist is a disgraceful one, but this last action is of a coolness that takes one's breath away. We do not know whether the law affords any protection to an artist from this sort of mutilation of his work, but if it does not, it ought to. The joy of our artists over the passage by the Senate of the free-art clause of the tariff bill, thus removing one stigma from our civilization, is likely to be somewhat dashed by this revelation that the days of barbarism are not yet over.

---

Why has such a profound silence fallen on the expounders of constitutional liberty in Hawaii? A commentary is urgently required on the present situation in the islands. We are not up to it ourselves, and can only state the facts. A provisional government, after having held office for sixteen months without a shadow of popular warrant, is at last shamed into calling a "constitutional convention" to establish permanent representative institutions. It fixes up a plan by which no one can vote for delegates, or be a member of the convention, without taking an oath of allegiance to itself, and by which, further-

more, an absolute majority of the convention is to be made up of members of the provisional government taking seats ex officio. Then they submit their ready-made constitution, adopt it by their own votes, promulgate it without submission to popular vote, and at once proceed to violate it by themselves naming a President for six years. Now it must be possible in some way to reconcile such proceedings with the Spirit of '76, and the Cradle of Liberty, and all the other sacred and patriotic things which we have been told have set up for themselves in Hawaii; but the official defenders of the Hawaiian brand of republicanism do not tell us how. We hope they will not be deterred by any little circumstance like the fact that they have denounced the Queen for the same thing that the patriots are now doing.

---

Prof. Laughlin of Chicago contributes to the *Atlantic Monthly* for July a sketch of the scheme for monetary reform in Santo Domingo, which has just gone into operation, that contains a good deal of interest to every student of the currency question. As will be remembered, the Dominican Government, seeing its income, with a silver currency, diminishing with the value of silver, and domestic bankruptcy impending, employed a commission, of which Prof. Laughlin was the head, to devise a new and safe monetary system. The scheme prepared changes the currency system directly from a silver to a gold basis. The monetary unit of the country is a gold dollar of the same value as the American gold dollar. The gold coins are to be, however, only of the denominations of $5, $10, and $20; a silver dollar of 380 grains to supply the smaller currency. All the silver coins are to be exchangeable at their face value for Dominican gold coins, and all the coins are to be minted and issued by a "fiscal agency" created by the Government. Both bimetallists and monometallists have told us that gold is the currency for rich and powerful, and silver for small and weak communities, but here we see a little republic, whose total area is only twice that of the State of New Jersey, and whose total population scarcely equals that of Colorado, accepting the gold basis as the one way of escape from financial ruin. The Mexican dollars which formed the money of account on that island, fluctuated in value so much that sometimes it took one hundred and eighty-five and sometimes two hundred of them to equal one hundred dollars in gold. The new Dominican system was enacted last March and went into effect on June 1. Its practical operation will be an interesting subject for study, but there can be no doubt of its success.

---

We hear much of the agricultural depression in this country, but it is doubtful if the most exaggerated accounts can equal the bare facts in regard to a farming region almost within walking distance of the Bank of England. A report on the agricultural crisis in Essex has lately been made public, in which is set forth a terrible story of abandoned farms and ruined farm buildings, of bankrupt landlords and starving laborers. Thousands of acres more will be left tenantless this year if the times do not mend, and if anything like the number of farmers who have served notices to quit act upon them. Specimen cases are given to show the extraordinary depression. A farm of 638 acres, which rented for $3,800 in 1875, brought only $2,300 per year from 1883 to 1886, and for the last five years has been let for *one pound* per annum—the tenant to pay the tithe, amounting to about $700. A farm of 600 acres (half under cultivation), which was bought in 1875 for $40,000, sold in 1885 for $2,100. The prime cause of such a disastrous downfall is the drop in the price of wheat. Essex is a wheat-growing county, and not easily adapted to market-gardening or dairying. Then the burden of taxation is crushing, in many cases the tithes being far greater than the rent. The tithe per acre and per capita seems to be peculiarly heavy in Essex, being four or five times what it is in several other counties. It is generally admitted that relief can come only by lightening taxation and diversifying crops; no sane person in England any longer talks about the possibility of shutting out foreign competition in agriculture.

---

Only a few days before Carnot's assassination a leading French authority on criminal law published an article on anarchist crimes. In it he took the view that criminal anarchism is nothing more nor less than a form of the vendetta—a form, of course, enormously magnified. The vengeful Corsican was satisfied with killing a single enemy, or, at most, all his enemy's family, while the dynamiter's rage is directed against a whole class of society. Herein, says M. Tarde, lies the weakness of society's defence against the anarchists. Society can seize and hang only the individual, leaving untouched the collective hatred of government and the collective assault upon it. If the epidemic of anarchist crimes continues, this French lawyer thinks, we shall have to meet it by "retrograding to the penal methods of primitive times"—that is, by applying the vendetta to anarchists themselves, or at least holding a certain number of them as hostages for the good behavior of the rest. All this is more curious than practical. There is no brand on anarchists to mark them off from the rest of mankind; and after we had killed off or imprisoned all that were known, our most unsuspected neighbors might take to throwing bombs or poniarding the mayor. There seems little prospect of permanent relief, in fact, except in steadily demonstrating that all the bombs on earth will not reform society, and that there will always be officials left to string up the bomb-throwers as fast as they come on. This, in time, will rob the bomb of its attractiveness as an instrument of political reform.

---

M. Stambuloff, the Bulgarian ex-premier, has been airing his grievances in an interview in the Vienna *Neue Freie Presse*. He complained of the ingratitude of his country, but assured Prince Ferdinand of his continued support, while reserving the right to oppose as a private citizen the new ministers, who "lack the ability to render the future of Bulgaria secure." M. Natchovitch, the new minister of foreign affairs, retaliates in the same paper with a frank and thorough arraignment of M. Stambuloff. He admits that Stambuloff did wonders in the beginning of his career, but says that much of the credit is due to the very able ministers with whom he surrounded himself, and who are all in office to-day. While these men were actuated by the loftiest patriotism, Stambuloff was consumed by personal ambition. On the accession of Prince Ferdinand, Stambuloff had to exchange the rôle of regent for that of constitutional minister—a bitter pill to swallow for a man "whose ideal of a statesman was a Turkish pasha." With his dissatisfaction his tyranny increased. Absolutely intolerant of criticism, he ruled Government officials and judges as well as the Sobranye with an iron hand. He manipulated elections solely in his own interest, "choosing his candidates personally, and ordering the chiefs of police to secure their election." Passing from the past to the present, M. Natchovitch promises that the cabinet in the first place will institute economic and financial reforms—in other words, that it will try to avoid a deficit. The Sobranye is to be dissolved, and elections are not to be interfered with by the Government. Russian influence, M. Natchovitch declares, is waning, in consequence of the doings of the Russian officials in Bulgaria, "who acquitted themselves of their task in the worst possible manner." However, the new ministry will "not needlessly wound Russian sensibilities." The Russian press, in commenting upon the situation in Bulgaria, professes to derive considerable comfort from the fall of Stambuloff. The *Neue Freie Presse* itself takes a very calm view of the situation, having full confidence in the prudence of Count Kálnoky, who brought about the independence of Bulgaria, while cultivating amicable relations with Russia.

*A RETROSPECT.*

THE adjournment of the Lexow committee until September seems to furnish a suitable occasion for bringing to public remembrance the extraordinary drama of which the investigation by this committee is the dénouement. The election of Grant in 1888 was one of the most important events in the history of New York, for he was distinctly a new kind of mayor. His novelty did not consist in his being a Tammany mayor, for there had been Tammany mayors before him. But they had, as had all mayors, been business men of greater or less prominence; men who had become conspicuous by following some reputable calling, and had thus given the public some guarantees of honesty and fidelity. His competitor, Mr. Hewitt, was not only a well-known merchant, but a man of real eminence in other fields, and had already served one term in the mayoral office, in spite of some mistakes, with real distinction. His defeat and Grant's election were accomplished by the old device of running a "straight Republican ticket," Mr. Erhardt having been nominated, to use "Johnny" Brodsky's acute remark, as a "running mate to Grant."

Grant's peculiarity lay in the fact that he came from an entirely new class, the obscure and liquor-dealing youth of the city. He was entirely unknown to the business world, or to any other world. He was young, had inherited some fortune from a liquor-dealing father, but had failed to acquire anything that could be called an education. He had been given the shrievalty by Tammany in order to reimburse him for electioneering losses when he ran against Mr. Grace in 1884, and had administered it in such a way as to call down upon himself subsequently a scathing presentment from the grand jury. What was most important was, however, that he represented, as no mayoral candidate had ever done before, what may be called the criminal and semi-criminal population of the city—the brothel-keepers and gamblers, the ward politicians, the corrupt police, and the large army of ignorant Irish, Germans, Bohemians, and Russians who are controlled by the police, constituting altogether the force with which Tammany ever since Tweed's day has contended for the possession of the municipal government. The nature of this force was at that time very well understood and had been fully described.

One would have expected that, under these circumstances, the Republicans would have refrained from running a candidate, and that genuine alarm would have been diffused among the taxpaying classes by Grant's election. But nothing of the kind happened. What did happen was extremely curious. A wave of hope and satisfaction with the new régime actually seemed to pass over the well-to-do classes. Grant received, if not a cordial, a well-marked welcome. He even obtained "social recognition." Attempts were made to make him a diner-out, and he "opened a ball" with Mrs. Astor. To people who asked him naïvely what kind of mayor he was going to be, he answered that "if he didn't prove a good mayor, it would be because he did not know how," and the word was passed round with congratulations. In fact, during the two months between his election and his assumption of office, there arose a belief that he was the coming man of a better era, and we were mysteriously assured that now at last we should have good government, for here was a mayor who had the masses behind him, and therefore could do what he pleased—"the masses" being the criminal and semi-criminal population aforesaid. Grant himself dexterously fostered the prevailing delusion by issuing a sort of manifesto in which he promised to select appointees for all vacancies "from the highest order of citizenship which the county affords." This was a very grateful announcement, because he was the first Tammany mayor to enjoy the absolute power of appointment, without the concurrence of the Board of Aldermen, which had been conceded to the mayor in 1884.

To crown all, he and his confederates in some manner procured the insertion in *Harper's Weekly*, Tammany's deadliest opponent in the Tweed days, of a long article announcing the appearance of a "New Tammany," with entirely new spirit and aims, governed by a "big four," consisting of Croker, Gilroy, Grant, and Cockran, whose portraits accompanied the article. This appeared July 13, 1889, after Grant had been some months in office. In it Croker owes his "preëminence" to "his political sagacity, political honesty, great knowledge of individuals, and spotless personal integrity," and "direct, downright strength of purpose." Cockran owes much to "his handsome presence, polished manners, and gift of rare eloquence," and is "an important and growing man." Grant is young, but won fame by refusing a bribe from Sharp, and is "a well-educated and tolerably astute politician." He is "shrewd and far-seeing," remarkable "for personal honesty and trustworthiness," "entirely fearless, and his party loyalty is beyond question." Gilroy is "a genial, pleasant, obliging man" and "remarkably gifted with business ability." These short extracts give but a very feeble idea of the brilliancy and integrity of the group into whose hands the government of the city had passed. It was all the more gratifying because at that period we were expecting a Columbus Fair in this city, in the management of which these gifted men were to figure largely, and Grant often sat in state at the city hall surrounded by an admiring council of city notables who were preparing for the occasion.

At this point the *Evening Post* took upon itself to make a stand against what it thought to be the prevailing madness, but it had to take it single-handed. It pointed out that Grant was not "well educated," but illiterate, that little or nothing was known about him, that his associations had all been low, that his administration of the sheriff's office had been disorderly and corrupt, and that it was extremely reckless to express any opinion about him till it was seen what his appointments would be. He made his appointments in due course. They were probably the worst lot the city had ever seen in public places, and were exactly of the old Tammany type. Gilroy, and "Barney" and "Jimmy" Martin were among them. Apropos of all this, the *Evening Post* pointed out, day after day, under reiterated charges of violence and exaggeration, that the idea that there could be a "new Tammany" was absurd on its face; that the nature of the organization was such that it could not change without ceasing to exist; it was necessarily supported and maintained in its lower strata by the criminal and semi-criminal portion of the population, and drew its revenues mainly from levies on vice. It said: "The society is simply an organization of clever adventurers, most of them in some degree criminal, for the control of the ignorant and vicious vote of the city in an attack on the property of the taxpayers. There is not a particle of politics in the concern any more than in any combination of Western brigands to 'hold up' a railroad train and get the express packages. Its sole object is plunder in any form which will not attract immediate notice from the police."

To justify these assertions, and if possible countervail the impression produced by the article in *Harper's Weekly*, that "the new Tammany" was composed of estimable youths struggling, under adverse circumstances, to give the city good government, the *Evening Post* collected evidence regarding the character and antecedents of the members of the executive committee, or governing body of the organization, with the following results, which were embodied in a pamphlet with extended biographical sketches of the whole gang:

| | |
|---|---|
| Professional Politicians | 28 |
| Convicted Murderer | 1 |
| Tried for Murder and Acquitted | 1 |
| Indicted for Felonious Assault | 1 |
| Indicted for Bribery | 1 |
| Professional Gamblers | 4 |
| Former Gambling-House or "Dive" Keepers | 5 |
| Liquor-Dealers | 4 |
| Former Liquor-Dealers | 5 |
| Sons of Liquor-Dealers | 2 |
| Former Pugilists | 3 |
| Former "Toughs" | 4 |
| Members of the Tweed Gang | 6 |
| Office-Holders | 17 |
| Former Office-Holders | 8 |
| Former Car Conductors | 3 |

| | |
|---|---|
| Former Plasterer | 1 |
| Former Navy-yard Caulker | 1 |
| Former Carpenter | 1 |
| Lawyer | 1 |
| Nominal Lawyers | 2 |
| Favored City Contractors | 2 |

The appearance of this pamphlet touched the leaders on the raw. Their first plan of defence was to have the editor of the *Evening Post* arrested for criminal libel by each of the gifted men composing the committee, in the hope that the annoyance would lead to the suppression of the pamphlet; but, after four failures to get an indictment from the grand jury, this was abandoned, and they apparently came to the conclusion that there was nothing for it but to seem as wicked as they really were. Since then they have attempted no resistance, though the English language has been exhausted by several prints in describing the vileness of their lives. They pocket their money and swallow the abuse.

All this occurred during Grant's first term. It was meant to show the city the real character of the man and his backers, and to prevent, if possible, the great calamity of having all the city offices filled by Tammany men, which would be the sure consequence of giving him a second term. Every one knows what followed. Scott was nominated in opposition to Grant, and the Republicans made a pretence of endorsing him; but 30,000 of them who registered stayed away from the polls, and Grant easily defeated him, and Gilroy in 1892 was elected. And now mark the consequence. Before Gilroy had been two years in office, it had to be generally admitted that so solidly entrenched behind the offices had Tammany become that it would be useless to elect a reform mayor this year without legislation enabling him to dismiss nearly all the city officials.

Let us observe that the evidence taken during the last few weeks by the Lexow committee has established in the fullest manner every charge or insinuation the *Evening Post* ever made against the Tammany organization or its members. At many things, of course, it could only hint. If, for instance, it had said that the police force of the city, from top to bottom, derived a large revenue from the wages of prostitutes—the lowest form of degradation to which civilized man can descend—only few persons would have heeded it, and yet this appears to be the simple truth. The organization is, and has been for twenty-five years, based on vice and crime, and lives by revenues furnished from this source. To suppose, therefore, that two or three men at the top could give it high aims without changing its subordinate agents or its inducements to join, is almost like supposing that something can be made out of nothing, or grapes be made to grow on thorns. Yet this great delusion has prevailed among us for nearly six years. Will the next generation fall a victim to it again?

*THE PULLMAN BOYCOTT.*

THE present boycott of the Pullman Car Company had its beginning in a reduction of wages which was forced upon the company last year by the panic. The company promised to restore the old rates as soon as business conditions would permit. Car-building is subject to competition, like other trades. Railroad companies buy cars where they can get them cheapest. Under the influence, or rather the inexorable law, of competition, the prices of cars have fallen in the last two years 24 per cent., and work is very slack at the reduction. Every car-builder, large or small, is anxious to keep his men together, both as a matter of humanity and as a means of taking advantage of the revival of business when it comes. It is for the interest of employer and employee alike to "grin and bear it" for a while, especially seeing that wages do not grow on trees and cannot be had except upon the condition of meeting the market. These conditions are sometimes hard. In fact, they are so hard in some countries that large numbers of people perish for want of sufficient nourishment every year. Anybody who fights against them, or who assumes that they do not exist, or who spends his time cursing the "iron law of wages," will go supperless to bed and will get no other reward for his pains. He may deprive some other people of their wages at the same time that he is losing his own, and that is what we are witnessing now on a pretty large scale.

On the 7th of May last the workmen of the Pullman car works made a formal request for a restoration of the wages they were receiving before the reduction of last year. Mr. Pullman met them two or three days later and gave the reasons why the conditions of business would not allow the restoration of the old rates. He said that the business depression and the reduction of orders for cars had compelled the company to reduce their force from 5,816 men in the beginning of 1893 to 2,000 on the 1st of November; that by hard struggling and by underbidding for work he had been able to keep the latter number employed and to increase the number gradually until he had 4,200 employed. How he had done this he explained in detail. He took an order for 55 passenger-cars for the Long Island Railroad at $300 per car less than the actual cost to the Pullman Company. He took an order for 300 cattle-cars and 250 refrigerator-cars for the Northwestern Railroad at $12 per car less than cost, and 25 cars for the Lake Shore Road at $79 each less than cost.

"I mention these particulars," he said, "so that you may understand what the company has done for the mutual interest and to secure for the people at Pullman and vicinity the benefit of the disbursement of the large sums of money involved in these and similar contracts, which can be kept up only by the procurement of new orders for cars; for, as you know, about three-fourths of the men must depend upon contract work for employment." He added that there was less than sixty days' contract work in sight under all orders, and no possibility of getting any more work at prices measured by the wages of May, 1893. In order to provide work and wages for the town of Pullman, where the company's largest interests lay, he had closed the Detroit works altogether. Furthermore, the company had expended $160,000 in internal improvements which, under normal conditions, would have been postponed or spread over a number of years.

On the day following this exposition of the company's affairs the local committee of the employees ordered a strike, which was at once carried into effect. Mr. Pullman was very much relieved by the removal from his shoulders of the responsibility for the bread and butter of those 4,200 men and their families. The Pullman Savings Bank had on deposit $488,000, nearly all of which belonged to the workingmen. The deposits immediately began to run down, having been reduced by the sum of $32,000 since the strike began—a much smaller reduction than might have been expected, seeing that the pay-rolls before the strike amounted to $7,000 per day. Probably some of the men got work elsewhere.

What followed is well known. The American Railway Union made a demand that the Pullman Company should submit to arbitration the question whether it could afford to raise wages at a time when it was building cars at less than cost merely in order to give the men employment at some rate of pay. An arbitration accepted voluntarily presupposes an agreement to abide by the decision of the arbitrators, but a decision in favor of the employees would not put the company in funds. It would not furnish new orders for cars at higher prices than before. As a decision adverse to the company could not be complied with in any event, an arbitration would have been not merely useless but a downright mockery, and, if adverse, would have left the company in a still worse position—a position implying bad faith. Probably the Railway Unionists had this fact in view when they insisted so strongly on arbitration, and when they refused the company's offer to submit its books to examination by a committee of the employees.

The present boycott is an attempt to starve out society. The whole population subsists by the movement of trains, and cannot exist more than a few days without such movement. When the pinch comes, it will be not merely the duty but the dire necessity of everybody—lawyers, doctors, merchants, and all who depend upon their labor for their

bread—to offer their services to the railroads as guards, or switchmen, or trainmen or what not. In passing judgment upon the enormity of the offence which the American Railway Union is committing, it must be remembered that not only is the strike which it has ordered entirely a "sympathetic" one, but that no warning was given to the different railroad companies which would have enabled them to meet the situation.

### *THE REAL PROBLEM OF THE UNEMPLOYED.*

IT is pleasant to note that the general nervousness and vague fear of last winter in reference to the unemployed have now so largely given way to a season of reflection and analysis. It is no longer enough for a set of men to exhibit themselves as an Army of the Unemployed to inspire sympathy or terror in the staid citizen and to make him feel that Congress or the State or city government should "do something." The time has come to cross-examine the unemployed, to ask them how they came into their present evil estate, what work they ever did and how they came to lose their jobs, and what work they could or would do now if it were offered them. Such questioning is the surest way to rid ourselves of the notion that there is anything new or particularly threatening about the matter as it presents itself today, but that it is simply the old question over again of what society is to do with the incapable and unwilling who cannot, or will not, earn an honest living.

We recently had occasion to refer to several interesting reports from American municipalities and charity organizations, which help to a cool understanding of who the chronic unemployed are and how they came to be so, and now we find strong corroboration of American experience in an article published in the June *Charities Review* on "The English Municipalities and the Unemployed." The writer, Mr. Edward Porritt, gives a running account of the reports which seventy-three municipalities made to the Local Government Board in regard to providing work for the unemployed within their bounds. The experiment is no novelty in England. Ever since the labor agitators "threw a scare" into the politicians of both parties in 1885, the demands and threats of the unemployed have been steadily intensifying, and the Local Government Board has issued a circular ever since 1886, urging vestries to give work to idle men. This work was to be of a kind which would not "involve the stigma of pauperism," which "all can perform," which "does not compete with that of other laborers," and "which is not likely to interfere with the resumption of regular employment in their own trades by those who seek it."

The results reported by the seventy-three municipal authorities cannot be claimed by the most enthusiastic advocate of state labor as furnishing any water for his mill. In a great majority of the cases the work was unsatisfactorily done and at an increased cost. The Hanover Square vestry for some weeks kept forty men at work repairing roads. The surveyor in charge reports that "the result has been simply to benefit the men employed at an increased expenditure of £2,000 over the annual estimates for labor and material." The Hampstead vestry hired snow-sweepers, and they were reported to be "idle, incapable of hard work, and not amenable to discipline." Carpentering work was offered by the Hackney Board of Works, but the "carpenters struck the first day for trades-union rate of wages." Some of the suffering unemployed were offered work at Finchley at fivepence an hour, but declined it on the ground that "their ordinary wage was sixpence." Mr. Porritt sums up by showing how the class of men described in the Government Board circular, "who honestly dread the pauper stigma," do not come within the scope of any of these schemes to provide work by municipalities. One report states that the men belonged to "the class of permanently unemployed"; which, says Mr. Porritt, "is the official and English way of stating that they were corner men, loafers." It is also clear from the English experiments that the popular use of the term "unskilled labor" is very inaccurate.

> "According to the reports of the municipal engineers, sewering, road-making, the grading of parks and gardens, and even stone-breaking, gravel-digging, and street-sweeping, cannot any longer be classed as unskilled work. Strength and endurance are needed for all this class of work, and also some degree of skill. Yet in the past it has all been carelessly grouped under the one comprehensive term of unskilled labor, and popularly regarded as work upon which any man may be put if nothing better or more suitable is offering for him."

All these investigations show how idle it is to imagine that any amount of work offered by Government or individuals would solve the problem of the permanently unemployed. Mr. Charles Booth, who knows more about the London unemployed than any man living, has justly said: "Lack of work is not really the disease; and the mere provision of it is, therefore, useless as a cure." In a recent address the Rev. Canon Barnett, warden of Toynbee Hall, that home of Christian socialism, made the following absolutely correct statement: "The unemployed, calmly considered, is not an army of willing workers; but is rather a body largely made up of those half employed, those unfit for employment, and those unwilling to be employed." It is clear that the real problem, therefore, is not to provide work, but to make men competent and willing to work. But that is a problem as old as civilization, as old as life itself. Nature's remedy is well known. Work or starve is the sharp dilemma she offers. Society's solution has hitherto been, Support yourself or go to the workhouse, or, if you are diseased or crippled, go to an asylum. The new system of coddling is no improvement. It makes men both more incompetent and more unwilling to work. If the State is to interfere at all with the operation of natural law in this matter, it should be in the aim to raise incompetence into fitness, to brand unwillingness as a crime. How to do that is the real problem of the unemployed.

### CAUSSES AND GORGES OF THE CÉVENNES.

MONTPELLIER, May 16, 1894.

EVERY reader of Stevenson knows intimately the region through which he took that memorable journey 'With a Donkey through the Cévennes'—the bleak uplands over which Modestine so unwillingly bore the traveller's sleeping bag, among Trappists and surly peasants and psalm-singing Camisards. Whatever part of this strange mountain country Stevenson chose to describe became the most interesting part; but man and nature evidently had helped to draw him further south, where the historical monuments are more numerous, and where are to be found three kinds of remarkable scenery, the plateaus of the Causses, the gorges, and the singular rock formations. Between the direct railway lines from Paris to Nîmes and Perpignan lies the saddle of the southern Cévennes, a region about fifty miles square, unpenetrated by a railway. Few travellers descend at the stations of Mende, Millau, or Anduze, whence the roads lead inland; but here at Montpellier I heard strange tales of roaring caves, unfathomable pits, narrow defiles, and rock cities, and three hours by rail took me to Pont d'Hérault, the southern gateway of the mysterious land.

The first day's journey was devoted to crossing the Aigoual, the highest mountain of the southern range, and a point of view over the *causses*. As far as Valleraugue, ran one of the astonishingly cheap and correspondingly dirty post-omnibuses which connect the principal towns. Thence a long ascent on foot gave opportunity for some generalizations on French highways. The road was a splendid hard *chaussée*, zigzagging up the desolate slope, the sections looking like the *disjecta membra* of a sea-serpent. It is a route little travelled and without great military importance; but French engineers do not know how to make a steep, irr gular, rough, or unsafe road. Substantial walls protect the outer edges, solid stone bridges cross the streams, distance is increased if necessary to secure an easy grade. Over the very summit of the Aigoual, a little more than five thousand feet high, runs the curious immemorial highway called the Draye; it is a broad track, marked by low walls, and indented by the travel of herds and carts for twenty-five centuries. Like the Rennstieg in Thuringia and the early highways in New Hampshire, it avoids bridges and détours by boldly following the comb of the mountain ridge from south to north. The country is a kind of historical exhibition of road systems: near this pre-historic unmade road are remnants of the steep and direct Roman highways, the rough mediæval mule-paths, the narrow and irregular wheel-tracks of the last century, and the

park-like modern *chaussées*. The causses region, with the numerous wide gorges, compel such Alpine engineering skill that an American hangs his head to think how much easier and better these highways are than the best country roads at home.

From the broad open dome of the Aigoual, the only granitic interloper in the family of the Cévennes, the topography of the country is manifest. A nearly level area, about three thousand feet above the sea, and probably an ancient "base-level," is underlaid by horizontal and pervious strata of limestone. The comparatively new streams have cut down deep cañons, back to their sources; but the lateral streams are hardly developed: hence between the gorges of the Tarn and its affluents, the Tarnon, Jonte, and Dourbie, stand the causses, enormous mesas, sometimes twenty miles across, and everywhere breaking off into imposing cliffs. It is a country such as the plateau of the Colorado is described to be, yet habitable and easily reached.

To begin the day's walk was easier than to end it, for the big farm-house at Sext-les-Cabanes was already overflowing with a household of thirty people—inmates and invited guests—and I was compelled to cut short the pleasure of sitting at the great open fire and talking to the hospitable host; an undue fastidiousness took me past the hostelry on the neighboring hill, and I was at last obliged to surprise the proprietor of a roadside *auberge* by knocking for a lodging. Yet, though he could give me only a rough place in the loft, I had the experience, usual in the Cévennes, of finding a clean and comfortable bed, tolerable food, and kindly people. There appear to be no summer stations in this part of the Cévennes; but the village inns, in spite of their dirty public rooms, leave rather a pleasant memory.

The road to Sainte-Enimie passes from the *auberge* through an elaborate tunnel, down a wild Alpine ravine to the Tarnon, and thence along the gorges of that stream and of the Tarn. Although it skirts the perpendicular walls of Causse Méjean nearly all the way, the road is more interesting for the passers by and the villages than for the scenery. The host at the *auberge* had served in the war against the Prussians, and had views as to the wastefulness of a three-years' peace service. All the way along, pleasant country folk were passing —carters, farmers, even a young man wearing the cap of the "Armée du Salut." It is rather a commonplace people, with little that is unusual in dress or manners, but habituated to dialects beyond the understanding of a foreigner. At the mid-day station of Florac there were even the regular commercial travellers, audibly partaking of soup and chattering over the wholesale price of wine.

Yet Florac was a Catholic stronghold in the fierce war of the Camisards, which showed the people of the Cévennes to be a tough and unconquerable race. The causses seem remote, but they have had their part in many of the world's great events. Across them marched armies over the two Roman roads; among the causses in 1627 Rohan made his desperate and unsuccessful attempt to resist the King of France; in the causses flamed up the memorable rising of the Protestants in 1702, the most stubborn of the protests against the revocation of the Edict of Nantes. When one sees the country, one understands something of the tenacity of Roland and his guerilla force, and his successful resistance to a marshal of France. The whole countryside is a stronghold; the causses are fortresses, the cañons impassable passes. It was only by building twenty roads across the country and by destroying more than four hundred houses that the insurrection was subdued; and yet Protestantism lived through all that persecution. Perhaps the women who wore out their lives in the prison tower at Aigues-Mortes for the crime of attending Protestant conventicles, were strengthened in their stubbornness by the sight of the distant Aigoual, whence Cavalier had descended to scatter the King's armies. At any rate, after a hundred years during which no marriage was possible except for adherents of the Church, when Protestant worship had apparently disappeared, the flame relighted spontaneously, and ever since the Revolution a considerable part of the population of the Cévennes has been strongly Protestant.

All the way from Ispagnac, six miles below Florac, the gorge of the Tarn deepens and narrows; but it was reserved for the third day's journey, from Sainte-Enimie to Peyreleau, to reveal the peculiar beauty of the valley. From the guide-books, both Baedeker and Miriam, one gathers that the gorge is a dark and gloomy chasm, shut in between beetling black cliffs, spanned by a narrow strip of sky, and resounding with the roaring of cataracts. In reality, the river flows easily and unbrokenly (except for two dams and one rapid) through a cañon smiling with green, abounding in singing-birds, and breaking out in cliffs of superb color, crowned with fantastic and beautiful rock formations. The walls rise in successive giant steps, leaving a green edge along many parts of the stream, and thickly wooded shelves and slopes higher up. There is a footpath all the way, usually on the edge of the river, but several times rising to terraces five hundred feet above, so as to avoid the overhanging buttresses of the mountains. Quaint villages appear, Chely du Tarn, and Hauterive, and La Sablière, almost indistinguishable from the gray rocks upon which they are perched. Caves are hollowed in the upper cliffs or near the stream, and one of them is walled in for a human habitation. Abundant springs gush out at the foot of the cliffs, fed by secret channels from the causses above. Here and there appears a château such as the beautiful La Case, a castle straight out of Turner's pictures, set within a pocket of the cliffs, in the midst of luxuriant trees, overhung by a cavern, hemmed in by the river; its gray towers looking less artificial than the red rocks above.

Below La Malcue the path becomes more capricious, and where it plunges upward the weary traveller took a broad and easy way which he knew runs into an "impasse," at a lonely farm. The only visible inhabitant was a girl in a cherry-tree, who consented to be the mouthpiece of a request for a boatman; and her clear, musical voice rings out across the gorge to an invisible person more than half a mile away. Voices reverberate, and in due time two men appear—for the shallow and rapid river is navigable, and more luxurious travellers descend in boats all the way from Sainte-Enimie. Presently one of these boats poked its shovel nose over the edge of the bank; it is shaped like an elongated flat-iron, with perfectly flat bottom, set with rows of big wrought-iron nails, and straight sides. An ordinary chair receives the passenger, while the boat, which draws about three inches, is guided or propelled by short stakes in the hands of two gondoliers. No motion could be smoother or more luxurious, no shallows more limpid, no deep pools more clear. The trout, plainly visible as they make their swift way up stream, were not more at home than we. Thus we slipped along through the magnificent defile of the Détroit. There are many deeper gorges—the edges of the causses are only about eighteen hundred feet above; there are many wilder ravines—the river is only at two places actually hemmed in on both sides by high cliffs. But one seldom sees such lavishness of form and color. The cliffs, grey, blue, brown, purple, golden, and black, are partly clothed with feathery trees; everywhere, up to the very top, are the carvings left by running water; caves of several stories; flat arches eight hundred feet high against the face of the rock; shelves with overhanging rocks a mile long; natural arches; rows of yellow pinnacles two hundred feet high, planted at intervals up a long slope, and a fretwork of fantastic rocks all along the top of the regular cliff. At the narrowest point the cliffs so overhang the stream as to look like an enormous broken vault, within which all the Baths of Caracalla might be set. The current too rapidly carries the traveller through these wonders to the point where the stream disappears into the tumbled mass of rocks caused by a mountain fall, the Pas de Souci. It is the precise spot where Sainte-Enimie, in a somewhat undignified pursuit of her and her convent's arch enemy, called on the mountain to stop him, and the big rock called the Sourde obligingly pinned him down, and still bears the mark of his burning claw. Below this point the gorge renews its stately beauty, but the mind is satiated with grandeur, and the body gratefully accepts the kitchen fire and the fried trout of the comfortable inn at Peyreleau.

The town is one of the most picturesque in the region. Like nearly all of them, it is grouped about and beneath a castle; but the old town walls and towers have been removed in all these villages, and, except at Nant, there is no remarkable church. Millau still possesses a mediæval town-hall, cathedral, and a timber house which may have been built when Millau was a frontier stronghold for the English. Above Peyreleau lies the gorge of the Jonte, similar in character to that of the Tarn, and penetrated by a road lying high up under the wall of Causse Méjean. Above Meyrucis—a Protestant centre in the war of the Camisards—the road winds up through one of the few old forests of the Cévennes to the plateau of the Causse Noire. A kindly farmer gave the pedestrian a lift, and told him that the peasants of the causses were contented and even well-to-do. It shows in them a cheerful character, for the outlook was cold and barren; low, flat hillocks of naked limestone made up a treeless and waterless waste; the immature valleys were dry, or led to sink-holes; the village of Lanuéjols was dirty and depressing. Yet from the well-made *chaussée* were visible good fields of grain, and there are abundant flocks. In fact, the peasants of the causses furnish a droll connection between two of the best-known French industries, the cheesemaking of the neighboring Roquefort, and the glovemaking of Millau; for the week-old lambs sacrifice their skins in order that their mothers' milk may go to the cheese factory.

The causses and the cañons make and supplement each other; it still remained to examine the curious rock-formations which in so many places mark the line where the plateaus break off. By common consent the most remarkable group of these formations is the labyrinth known as Montpellier le Vieux, almost ten miles from Millau. A climb of an hour from the road along the Dourbie brings one suddenly into this uncanny place. The

first impression is one of personal injury. Is this the "rock city" which the guide-books promise, this group of white rocks, indistinguishable from below, unknown ten years ago, and only one of half-a-dozen neighboring groups scattered along the edge of the Causse Noire? Are these spaces, between the rocks, the corridors and streets and arcades of which people talk? It is only after wandering about, penetrating the mass, and climbing to the Douminal, the highest and most majestic pinnacle, that one begins to appreciate the extraordinary grandeur of nature's architecture. It stands above the level of the causse behind it, and looks almost straight down fifteen hundred feet into the gorge of the Dourbie. The base is a soft, regular green mound, upon the slopes of which rise a wilderness of detached and giant rocks, from twenty to three hundred feet high; on this absolutely waterless spur of a waterless causse, every rock bears the mark of the carrying power of a running stream. The resulting forms are not only fantastic and beautiful, they are on a scale and of a kind not commensurate with human language, because not comparable with any works of man. Gradually one sees a kind of plan in it all: about the central group lie four basins, the shallow heads of ravines; in each are arranged long parallel ridges, which are subdivided by cross alleys into detached blocks, many of them perforated by caves, and some opened into magnificent gateways. It is not a city, for what city has streets set on either side with buildings a hundred and fifty feet high? It is not a sanctuary, for even in Egypt there are no monoliths that cover an acre. It is not a fortress, for no artillery could batter such breaches through walls a hundred feet thick. Imagine all the tombs and ruins of the Campagna, all the broken piers and arches of the aqueducts crowded together into a space of five hundred acres, the lower part still hacked and cut away by the Barbarians, and you have some conception of the magnificence of Montpellier le Vieux. All this is set on a mountain top, in absolute loneliness, with views of similar majestic forms in every direction. To the geologist it must be a puzzle, and at the same time a remarkable instance of the power of water and wind to shape solid stone. To the layman it is the most fascinating of all the beauties of this remarkable region.

ALBERT BUSHNELL HART.

## THE BUREAU OF ROLLS BULLETIN.

TO THE EDITOR OF THE NATION:

SIR: In No. 1513 of the *Nation*, June 28, very fairly reviewing the Bulletin of the Bureau of Rolls and Library of the Department of State, you say, of the miscellaneous index, "in No. 3 it ranges from Adam to Zeisberger (the last entry being a repetition, by way of correction, of the same item entered in Bulletin No. 1 under 'Feisberger,' but, alas! a fresh error is perpetrated by misspelling 'Ziseberger')."

Will you kindly allow me space for a correction, and a word more? The spelling "Ziseberger" is correct; no fresh error has been made, although it is easy to see how the reviewer has been led to think so. The index, of course, bears the name found in the autograph signature of the letter indexed. In the two letters mentioned in Bulletin No. 3 the autograph signature is "D. Ziseberger."

In the Introductory Note to the Documentary History of the Constitution, to be found with the title-page for volume i., at the end of the Appendix, Bulletin No. 3, the following statement is made:

"The purpose in view being to avoid controversy and to meet the demand of historical scholars and students by presenting the contents of the papers themselves, as classed and filed in the Department, and as verified by the records, and nothing more, the editorial function is confined to the general form of the text, and to such notes as may be indispensable to clear display."

This purpose was not determined upon without very careful consideration of other views, and the attitude assumed would seem to be justified both by circumstance and example. As it is the purpose to add nothing, so it is the purpose to withhold nothing; at the same time only official and authentic records can be properly used in the Bulletin to amplify or explain the Archives. ANDREW HUSSEY ALLEN.

WASHINGTON, D. C., June 29, 1894.

## THE NILE CORVÉE.

TO THE EDITOR OF THE NATION:

SIR: At last her Majesty's Government have acknowledged the deception practised upon the civilized world by the pretended abolition of forced labor in Egypt. In 1891 Lord Cromer said: "The corvée has been wholly abolished." In the same Parliamentary Report, Sir C. Scott-Moncrieff said: "In 1890, for the first time, perhaps, in all history, there was no corvée in Egypt." Lord Cromer now states that these assertions were absolutely and unqualifiedly false. He concedes that the Powers placed at the disposal of the Public Works Department £400,000 ($2,000,000) annually because "the laborer is worthy of his hire." He knew that the assertion, made with every guarantee of truth, that this money had been applied to the extinction of forced, unfed, and unpaid labor, to the suppression of a serfage in comparison with which any such corvée as that of the French peasant before the Revolution was the lightest of burdens—was universally believed to be true. In the last Parliamentary Report, Lord Cromer states that the corvée is used in guarding the Nile banks; that it is "a hardship" and "an evil"; that it amounted last year to a total of over six million days' work of forced, unfed, and unpaid labor; that peasants, arbitrarily selected—"in the usual manner"—were required to work, "on an average," for eighty-five days, in Lower Egypt.

He seeks to minimize the wrong by saying that "the work was done at a time when, the country being more or less flooded, the mass of the agricultural population cannot work on their fields." This is a mean subterfuge. Lord Cromer knows perfectly well that, during the three months of high-Nile, the peasants of the Delta are at work in their fields, and that no considerable part of Lower Egypt is ever flooded. Fifty-two thousand peasants were taken from their fields as well as their homes, even if a considerable part of the thirty thousand peasants of Upper Egypt would have been awaiting the falling waters to sow their inundation crop.

There is no longer any pretence that the laborers cannot be obtained. "The people willingly come out and work for payment." "It is possible to insure each man employed receiving his daily wage." Lord Cromer fixed the amount of winter corvée in 1884 at 5,100,000 days' work. Conceding that it was not diminished by changes in the irrigation system, as we were assured that it had been, these five million days' work were paid for out of two millions of dollars, practically of land-tax, granted by the Powers. But Lord Cromer now states that a day's work can be redeemed for fifteen cents; which would make a total for the winter corvée of $750,000. This would leave $1,250,000 to redeem the Nile corvée, which is estimated by the English inspectors-general of irrigation at only $900,000. Is it surprising that a demand is constantly made for the subjection of the accounts of the Public Works Ministry to an independent auditor, when such glaring discrepancies are disclosed by even such a relatively superficial inquiry as that which we are enabled to make from reports in whose most solemn asseverations, as we have seen, not the slightest confidence is to be placed?

To any suggestion that the debt of Egypt had been increased by 25 per cent.; that the cultivation of tobacco had been prohibited; that crime was rife; that five millions of Sudanese had perished by agonizing deaths in four years; that the troops amnestied at Tel el Kebir as a condition of surrender had been deported to Darfur, and not a man was left alive of more than twenty-five thousand of Arabi's soldiers; that the cruel tax invented and imposed under the title of *rachat militaire* was a monstrous abuse of delegated powers—to all and sundry of the administrative errors which could not be denied or concealed, England answered: "We have wholly abolished the corvée." And now it is admitted that this has never been done. An illusion has been dispelled. COPE WHITEHOUSE.

LONDON, June 22, 1894.

## "BACK AND FORTH."

TO THE EDITOR OF THE NATION:

SIR: This phrase is generally characterized as an Americanism, and, inasmuch as its use is now confined to America, is correctly so characterized. To judge from the treatment of it by the *Standard Dictionary*, however, it is current English; an opinion which is supported by an unfortunate mistake resulting from the carelessness of one of Dr. Murray's multitudinous readers.

Dr. Murray gives only two quotations for it, one of them being from Mr. E. P. Roe, and the other running as follows:

"1839. *Anecd. & Trad.* (Camd). Young girls . . . dance over the candle *back and forth*."

To satisfy my curiosity, I have consulted the book thus referred to, and have there found:

"The young girls in and about Oxford have a sport called Leap Candle, for which they set a candle in the middle of the room, in a candlestick, and then draw up their coats in the form of breeches, and dance over the candle *back and forth*, with these words:

"'The Taylor of Bisiter he has but one eye;
He cannot cut a pair of green Galagaskins, if he were to try.'

"This sport, in other parts, is called dancing the Candle Rush." Bp. White Kennet (died 1728), in W. J. Thoms's *Anecdotes and Traditions* (1839), p. 96.

For *back and forth* I can produce but one other quotation from any English author:

"But the Marriners, having once gotten them aboard, did make their ships as so many prisons, or houses of torture, to wrest their wealth out of their hands, lengthning the time by circular and vnnecessarie turnings, *backe and forth*," etc.—Rev. Dr. Thomas Jackson, *Commentaries vpon the Apostles Creede*, vol. i., p. 196 (1613).

That *back and forth* was ever better than a provincialism is unlikely. I have met with no notice of it in anything that has been written on the English dialects. Yet a neighbour of mine, a clergyman, informs me that, in Devonshire, of which he is a native, when a person goes on showing the palm and the back of his hand alternately, he is said to turn his hand *back and forth*.

*Back and fore*, "the hinder part foremost or before," is mentioned in Mr. F. T. Elworthy's *West Somerset Word-book*. *Back and to*, "to and from," is entered in Mr. Robert Holland's *Glossary of Words used in the County of Chester*. *Forth and back* is heard in Cornwall, on the authority of a writer in *Notes and Queries*, February 17, 1894. *Voar an' back* is used in Devonshire, according to Mr. R. Pearse Chope's *Dialect of Hartland*.

Did we get *back and forth* from England? Or was it altered, among us, from the *back and fore* which many immigrants must have brought over from Scotland, where it has been for many generations familiar? So far as at present appears, our colonial forefathers knew nothing of it; at any rate, neither Dr. Witherspoon nor the Rev. Jonathan Boucher records it as one of the eccentricities of speech which marked Americans between 1761 and 1775. Mr. Pickering, in 1816, calls it "a very common expression in New England," adding, "but it is used only in conversation." Of late years, as all are aware, it has invaded our literature frequently. Whether Mr. S. G. Goodrich, Dr. J. G. Holland, Mr. G. P. Marsh, Mr. Richard Grant White, Mr. J. R. Lowell, Mr. W. D. Howells, Mr. C. D. Warner, Prof. T. R. Lounsbury, and others have adopted it from ignorance, or, if not so, with design to lend their aid towards establishing a new dialect, is matter of speculation. F. H.

MARLESFORD, ENGLAND, March 21, 1894.

P. S. In No. 1456 it was pointed out that the adverbial *back of* is not peculiar to the United States, but has been long prevalent in Ireland. Now it turns out that it is known in at least one part of England, also, shortened from the dialectal *aback of*. See Mr. R. O. Heslop's *Northumberland Words*.

Subjoined is a quotation for a colloquial Hibernianism, hitherto unnoticed, *to the back of*, "immediately after," in which sense there was, of old, *on the neck of*, *in the neck of*:

"He made her drink a bumper, and another *to the back of it*." Anon., *History of Ned Evans* (1796), vol. i., p. 185.

To my letter in No. 1497, it may be added, that in Fielding's *Tom Jones*, *at all* occurs thirty-two times, and sixty-five times in Cardinal Newman's *Apologia*.

# Notes.

MERRILL & BAKER, New York, have in preparation a number of new editions with illustrations in photogravure—George Eliot's 'Mill on the Floss,' in two volumes, McCarthy's 'History of Our Own Times,' in four volumes, More's 'Utopia,' and Anacreon.

A biography of Bismarck by Hans Blum will be published during the present year in five volumes, at five marks each, by C. H. Beck in Munich. The part which has already appeared contains an interesting account of Bismarck's life as a student at Göttingen in 1832 and 1833, where his skill in fence won for him the surname "Achilles the invulnerable." In three terms he fought twenty duels and received only a single wound, of which the scar on his lower jaw near the lip is still perceptible; but as this was caused by his adversary's blade flying from the hilt, it was contrary to the code, or *Comment*, and declared to be a "Sauhieb" (foul blow), and therefore "invalid," so that his reputation for invulnerability remained technically unimpaired. Indeed, he became so notorious in this respect that the University authorities forbade him to fight certain projected duels, on pain of expulsion; and a month later he was sentenced to three-days' incarceration for a like offence. His first duel was with an Englishman, who had spoken in derision of "the German Michael with his night-cap over his ears and in a motley dressing-gown made up of thirty-six shreds and patches"—alluding to the many petty States of Germany. With an American student he made a bet that Germany would be politically united in twenty years. The wager was twenty-five bottles of champagne, to be drunk in the country of the winner. After the lapse of this score of years, in 1853, Bismarck was preparing to cross the sea in order to pay the bet, when he learned that the American had died, and adds: "The name he bore did not presage a long life—Coffin."

'Beyond the Rockies,' by C. A. Stoddard (Scribners), is the somewhat vague designation of a book which is better described in its subtitle, "A Spring Journey in California." It is a very superficial glimpse of southern and central California as seen by a Raymond tourist. Texas, New Mexico, and Arizona come in for brief mention by the way, and one chapter describes a visit to an Indian school. Santa Barbara, with its Spanish quarter and flower festivals, is well described, but the chapters on the Yosemite are chiefly a record of the misfortunes and fatigues which prevented the writer from seeing anything. No doubt the Southern Pacific Railway does manage things very badly, but when one writes a book on such a region, he ought to make himself independent of time-tables and excursion parties. We are surprised that so hasty a traveller should have a chapter on the seldom-visited Hetch-Hetchy Valley; but the description proves to be a copy of a friend's letter. The twenty-three full-page photogravures are the best things in the book.

'The Garden that I Love,' by Alfred Austin (Macmillan & Co.), is a sort of vent for the author's opinions on all topics—a book which might have been written in response to a certain child's naïve request when entertaining an older person, "Please tell me all you know." However interesting such books may be to the author's friends, they run some risk with the public. This one will not please a gardener more than a poet or a silversmith. It contains something about a garden, to be sure, and also something about a house and the furnishings thereof; something about a tea-urn, about Veronica, Lamia, and "the poet," with specimen poems thrown in; but not enough about any one thing to gratify any special taste.

Contrary to established precedent, from Æsop down, the animals in 'The Jungle Book,' by Rudyard Kipling (The Century Co.), have not learned to talk merely for the sake of delivering moral lectures. This will recommend the book to young people who are not in special search of improvement, as well as to their elders, who presumably never need it. Relieved of all fear of having a moral sprung upon them, they can give themselves up to undivided enjoyment of these genuinely interesting creatures, and feel a pleased surprise at the end to think they have learned so much about the "jungle folks" without having to read a single dull sentence. The chief personage is Mowgli, a boy who was carried off by a tiger and rescued and brought up by a genteel family of wolves. Their education of him was so judicious and successful that we should hardly be surprised to hear of a prosperous jungle boarding-school for boys under their direction, when these stories become well known.

'Children's Singing Games, with the tunes to which they are sung,' collected and edited by Alice B. Gnome (Macmillan), is the first book of a series of which a second is promised for next Christmas. It is tastefully printed, and so freely adorned with pictures that it will interest even such children as do not care much for the poems, prose, or melodies that make up the bulk of it.

'The Inflections and Syntax of the Morte d'Arthur of Sir Thomas Malory' (Boston: Ginn & Co.) is a monograph which does the author, Dr. C. S. Baldwin, much credit. Some of the remarks about forms are of no great moment, but the syntactic matter will all be welcome to specialists. Malory's position, chronologically and "litteraturgeschichtlich," makes so good a study of his syntax as Dr. Baldwin's an important contribution to a neglected department of English linguistic history. One may pick a flaw here and there, but only Momus would make much of such trifles in view of the general excellence of the book. The material is abundant and arranged with remarkable clearness and method. We hope Dr. Baldwin will continue his syntactic investigations.

The aftermath of the World's Fair at Chicago which has been a whole year in gathering is represented at this moment on our table by four solid volumes. One of these emanates from the Society for the Promotion of Engineering Education, and contains the proceedings of Section E of the World's Engineering Congress, July 31–August 5, 1893, on the subject of engineering education. Another and larger volume is the Proceedings of the International Congress of Education, July 25-28, 1893, edited very conscientiously and intelligently by N. A. Calkins (Washington: Z. Richards, 1301 Corcoran Street). It is a reference work of permanent value, and is well printed and indexed. There is no teacher in any grade of instruction who could not profit by this classified collection of papers from all quarters of the globe. Huger still in appearance, though containing fewer than the 1,000 pages of the volume just named, is 'The World's Congress of Representative Women, May 15-22, 1893,' edited by May Wright Sewall (Chicago: Rand, McNally & Co.; New York: J. A. Hill & Co., 44 East Fourteenth Street). Here the striking feature is the large number of portraits, mostly of the women who participated in the congress. The text offers much food for reflection in ways intended and in others. The last volume on our list is also the most elegant: 'Memoirs of the International Congress of Anthropology, August 28-September 2, 1893,' edited by C. Staniland Wake (Chicago: Schulte Publishing Co.). The divisions of the contents are physical anthropology, archæology, ethnology, folk-lore, religions, and linguistics, besides a supplement consisting of two papers in German. The names of a portion of the writers—D. G. Brinton, Franz Boas, Otis T. Mason, Carl Lumholtz, Walter Hough, John C. Fillmore, Alice C. Fletcher, Frank H. Cushing, W. W. Newell, Horatio Hale, Washington Matthews, Cyrus Adler, Morris Jastrow, jr.—suffice to indicate the worth and readability of these memoirs.

'Die Medicinische Wissenschaft in den Vereinigten-Staaten,' by Dr. S. Placzek (Leipzig: Thieme), is a little volume of "Reisestudien" made in connection with a visit to the Columbian World's Fair. The author does full justice to the evolution and application of medical science in the United States, and pays a warm and willing tribute of praise to whatever he finds worthy of commendation in arrangements for the prevention of disease or for the cure and care of the sick. He saw much to admire in our hospitals, especially in those founded by private beneficence or connected with universities, as, for example, at Johns Hopkins, but speaks in severe terms of the sanitary condition of our large cities, which seem to have made an unfavorable impression upon him, both architecturally and hygienically. As the regulations on paper are sufficiently strict, he does not understand why the streets of our chief metropolis should be in such a filthy state. Dr. Placzek has a chapter on "The American Physician" and the ethics of the profession. The work is profusely illustrated.

Among the several excellent articles which compose the volume 'Nouvelles Études de Littérature et d'Art,' by M. G. Larroumet (Paris: Hachette), the last, on Max Nordau's two-volume arraignment of literary men and artists, 'Entartung,' will certainly attract attention. As a matter of course, M. Larroumet, himself a writer, was not likely to accept without examination and discussion the startling statements made by the Hungarian doctor of medicine. The discussion is contained in this new volume and is vivacious, to say the least. Ibsen also has an article devoted to his genius and his plays, the performance of which in France marks, in M. Larroumet's opinion—and he is a competent authority—a step in the history of French dramatic art. The other articles are, with two exceptions, on French writers and artists.

The sixth volume of 'La Bataille Littéraire,' by Philippe Gille (Paris: Victor-Havard), treats of books which appeared in 1891 and 1892, and will be useful as an occasional reference, but it is not equal to Ginisty's publication, and is, besides, not sufficiently up to date.

Prof. Giuseppe Rossi of Pisa has just added another to his valuable series of monographs on the philosophers of the Renaissance. It is a brief but interesting study of Nicholas of Cusa, in whom the author professes to find a critical monism not unfairly suggestive of Kant and Hegel. Prof. Rossi feels that the Renaissance—the cradle of modernity—has been ignorantly slurred over by historians of philosophy. He believes, moreover, that in the custom of thinkers of that time simultaneously to profess physics with metaphysics, concrete experiment with abstract speculation, lies the one possibility of a sound method. If in his zeal the Italian scholar occasionally confuses his own lights for the lights of his author in hand, he is, nevertheless, we believe, in his main contention right, and we commend his arguments to the notice of students supersaturated with German systems or English want of system.

Mr. George S. Boutwell writes of "Kossuth in New England" in the *New England Magazine* for July. Mr. Boutwell was Governor of Massachusetts at the time, and is one of the group of the reception committee portrayed on page 531, of whom four out of the five attained great prominence in national affairs—Wilson, Banks, and Burlingame, besides the future Secretary of the Treasury. Mr. Boutwell is singularly ill-informed about Kossuth's relations to the abolitionists, and fails altogether to notice Kossuth's bid for the support of a slaveholding republic by refusing to give any countenance to the anti-slavery movement. A brief paper, in the same magazine, on "The First Abolition Journals," by Samuel C. Williams, is a valuable contribution to the history of the precursors of the *Liberator*.

*La Réforme Sociale* for June 1 opens with the address of M. Georges Picot of the Institute before the Société d'Économie Sociale, in which he defends the organized efforts to better the condition of the poor from the attacks of the socialists. Other articles are one upon the manner in which the artisans of Berlin are lodged, and one upon the work of the Société Foncière of Canada in founding French villages on the line of the Canadian Pacific Railway in Manitoba. The most important paper, however, is M. Maurice Barrat's account of the French possessions on the Congo. The inhabitants he divides into two classes, the aborigines and the invaders. The former have nearly disappeared, though singularly their language has survived and has become the commercial language of the colony—the only medium of intercourse between the Europeans and the negroes. Of the material resources of the country, whether mineral or agricultural, he speaks with unusual soberness and caution, calling attention to the fact that though there are abundant evidences of the presence of copper, silver, and iron ores "of great richness," and much of the land is well adapted to the cultivation of coffee and cacao, yet the lack of means of transport to the coast will for a long time prevent the working of the mines or cultivating the land to advantage. It is not the place for the colonist to make a home for his family; only companies with large concessions of territory can accomplish anything. The impression left is that the chief energies of the French authorities hitherto have been directed rather to the extension of their possessions in the interior than to the development of the regions near the coast.

A not much more encouraging account of French colonial enterprise is to be found in the anonymous article on Timbuctoo and the future of the Sudan, in the *Vie Contemporaine*. The principal military events leading to the occupation of this city are briefly sketched, together with the measures taken to bring the western Sudan under the French influence and to unite it with Senegambia on the west and Algeria on the north. The writer frankly acknowledges the worthlessness of much of the territory acquired, especially as compared with the English sphere of influence, but hopes that, with the construction of a trans-Saharan railway, either to the Niger or Lake Tchad, the whole commerce of the Sahara will be turned into French channels.

The persons, chiefly politicians and missionaries, who write with such confidence as to the duty of the European governments immediately to construct railways from the coast to the interior of Central Africa, should ponder a statement just submitted by the Belgian Government to the Chamber regarding the Congo Railway. The work of building a railroad to connect the head of navigation on the river with Stanley Pool was begun in 1890, and at the end of three years "of almost superhuman effort" only the first section of 40 kilometres, about twenty-five miles, has been completed. "The main obstacles to progress have been the climate, the soil, the conformation of the country, and the impossibility of finding capable workmen." It is probably not too much to say that these obstacles would prevail to an even greater extent on the east coast, where the British and Germans are urged to build roads to the great lakes, as well as in the French road across the Sahara, stretching for 1,600 miles through an almost foodless and waterless desert. In each of these cases the difficulty of provisioning the working parties must undoubtedly prove far greater than the providing for the Belgians on the Congo.

A remarkable journey has just been completed by a Frenchman, M. Lionel Decle, who was intrusted by his Government with a scientific mission to study the anthropology and ethnology of the various native races of south and east Africa. Leaving Cape Town in May, 1891, he made his way north through Matabele and Mashonaland to the Zambesi. Thence the transit by way of the great lakes to Uganda proved to be no very difficult task. At Uganda he joined Major Owen's detachment of the British expedition against the King of Unyoro, and accompanied this officer to Wadelai on the Nile, being the first traveller to reach this river from the Cape of Good Hope. Returning to Uganda, he passed through the Masaï country, arriving at the coast in May, just three years from his time of starting.

"Caligula" is the title of the leading article in *Die Zukunft* for June 2, a weekly journal edited by Maximilian Harden and published by Häring in Berlin. No sooner had Dr. Quidde's pamphlet on the crazy son of Germanicus begun to excite attention than Herr Harden wrote a letter to the author urging him to become a regular contributor to *Die Zukunft*, and expressing his regret that the essay had not been printed originally in this paper. Dr. Quidde declined the invitation, on the ground that he was already overburdened with literary work, and added that his political views differed so radically from those of Herr Harden as to render such a journalistic collaboration undesirable. Thereupon Herr Harden reviewed Dr. Quidde's pamphlet in the above-mentioned article, denouncing it as "a gross and utterly worthless caricature" and "a malicious and insidious lese-majesty," and expressing a very unfavorable opinion of a scholar who could put forth such a libel (*Schmähschrift*) and call it an historical study. One thing, however, disturbs him, namely, the eagerness of the German public to buy the pamphlet, of which twenty-one editions have been sold.

We have received from the publisher, H. Laurens, 6 rue de Tournon, Paris, Nos. 10–12 of *Le Modèle*, a fortnightly portfolio of plates labelled "artistic documents and ideas easy to apply or to work up, and intended for artists, amateurs, and industrials." Prof. G. Fraipont presides over the selection, which embraces animal and human figure studies, landscape, and various conventional essays in decoration. There is no proper text, but the cover is used for instructions how "to apply or to work up" the designs of the number, as well as for answers to correspondents.

From Dyrsen & Pfeiffer we have the first five *livraisons* of Maspero's new 'Histoire Ancienne des Peuples d'Orient,' volume one embracing Egypt and Chaldæa. There will be 150 parts like these, or three volumes for the entire work. The typography is worthy of the house of Hachette. The illustrations are very numerous, and exemplify the every-day life of the people or give the characteristic scenery of the East. This history needs no praise from us, but we cannot well examine it until it is further advanced.

In a Note in No. 1507 we described the new

map of France issued in convenient sheets by the Department of the Interior, and stated that the price per sheet folded into a lettered cloth case was one franc. We followed last year's circular, but the price appears to have been raised to one franc five centimes, as we perceive from a sheet dated May, 1894. This means but a cent additional in our money.

—The site of Chicago originally was intersected by a sluggish river flowing into Lake Michigan. In 1848 the Illinois and Michigan Canal was completed, connecting the south branch of Chicago River with the Illinois River. The canal was, in part, supplied with water for its locks by pumping from the South Branch. As Chicago River became more and more foul the pumping facilities were enlarged, and sufficient current from the lake was established to mitigate, and at times to remove, the nuisance; but, during freshets, so strong an outward current was established as to carry sewage to the intake of the water works. During all this time, Chicago had been dreaming of a ship-channel to the Mississippi. Finally, this commercial ambition became so effectively reinforced by the crying sanitary evils that a majestic project, no less than for a huge channel leading from the lake, without pumping, through Chicago, to the Illinois River was adopted, and is now in active construction. This "drainage channel and waterway"—of course, the largest in the world—is to cost some $22,000,000 for about 37 miles. In its engineering aspect the work is of the greatest interest. The highest land to be crossed is about 23 feet above the level of Lake Michigan. The summit rock, over which, before its upheaval, the waters of the lake once flowed 20 feet deep, on their way to the Mississippi Valley, is now only 30 feet above the bed of Niagara River near Buffalo. Across this divide the canal is to be cut with a depth of channel of 18 feet, a bottom width of 160 feet, and a velocity of flow not to exceed three miles per hour. This ultimately constant flow of pure water from Lake Michigan of 600,000 cubic feet per minute will suffice to remove all sewage, to maintain Chicago River in a state of purity, and for ever to obviate the contamination of the city's water supply, which recently caused such a fatal and widespread epidemic of typhoid fever. The history, description, and illustrated details of the work are fully set forth in G. P. Brown's 'Drainage Channel and Waterway' (Chicago: R. R. Donnelley & Sons)—an excellent book, with the most inadequate index that it has been our fate ever to find in any work on a technical subject.

—Apropos of the recent discussion in our columns as to whether or not the Dred Scott case was "the first in which an act of Congress was *decided* by the Supreme Court to be unconstitutional for reasons not relating to its own judicial department," the second part of Prof. James B. Thayer's 'Cases on Constitutional Law,' which has just appeared (Cambridge: Charles W. Sever), contains on pages 480–496 a painstaking compilation of historical and judicial note and comment regarding the case. It supports the view that the only *decision* of the court in the case was that of Justice Nelson, as concisely summarized in the critical review of the case published in 1857 by Messrs. (afterwards Justices) Horace Gray and John Lowell: "A slave taken by his master into a State or Territory where slavery is prohibited by law, and afterwards returning with his master into a slave State and acquiring a residence there, if deemed by the highest court of that State, after his return, to be a slave, must be deemed a slave by the courts of the United States, and, therefore, not entitled to sue in those courts as a citizen of that State." Seven of the nine judges concurred in this conclusion, which was originally intended to be the *opinion* (as it was the *decision*) of the court, until Justice Wayne conceived the idea that the slavery question could be settled by a judicial essay on the whole question, and the case was accordingly remitted to the court for the several justices to write their individual opinions upon. In Judge Nelson's own words, concurred in by all the majority judges, "Our opinion is, that the question is one which belongs to each State to decide for itself, either by its Legislature or courts of justice; and hence, in respect to the case before us, to the State of Missouri, a question exclusively of Missouri law, and which, when determined by that State, it is the duty of the Federal courts to follow. In other words, except in cases where the power is restrained by the Constitution of the United States, the law of the State is supreme over the subject of slavery within its jurisdiction." "The question involved is one depending solely upon the law of Missouri; and . . . the Federal Court sitting in that State . . . was bound to follow it." The case, by a consensus of all the majority judges, being thus disposed of, Judge Taney's famous opinion is shown to be *obiter* and extra-judicial. Judge Curtis seems to have recognized this in the opening words of his dissenting opinion: "I dissent from the opinion pronounced by the chief justice, and from the judgment which the majority of the court think it proper to render," etc. And Prof. Thayer quotes voluminously instances where the opinion of the justice was not the judgment of the court. He makes a strong case for his contention, which seems to have been adopted by Bryce ('American Constitution,' i., pp. 256-7, 1st ed.); but, whatever the *judgment* of the court, it was the chief justice's "*dicta* on various other points touching the legal status of negroes and the constitutional views of slavery," and the intent of the majority to declare the Missouri Compromise unconstitutional, that gave the case its importance in history, and will for all time, rightly or wrongly, cause it to be referred to as "The Dred Scott *decision*."

—At the May meeting of the Royal Astronomical Society of London, that eminent scientist Dr. David Gill, her Majesty's astronomer at the Cape of Good Hope, presented his final results of determination of the sun's distance by measurements on the small planets Victoria and Sappho, and concluded his paper with significant suggestions which are already under consideration by the council of the society. First, he inquires whether, in the opinion of astronomers generally, steps should be taken for a more complete and harmonious organization and partition of the astronomical work of the world from the year 1900; and, second, whether astronomers are ready to enter upon a preliminary study, discussion, and experiment on the practical methods by which the art of observation may be raised to a higher level of accuracy, and its results be derived and published in a more systematic and homogeneous system. If these questions are answered in the affirmative, he further suggests an International Astronomical Congress, say two years hence, to discuss and make the necessary preliminary arrangements, the definitive programme and partition of the work to be undertaken at another general congress in the year 1899. Dr. Gill will be recalled as the originator of the Astro-photographic Congress, first established at Paris about seven years ago, the important work of which is now in progress in a score of observatories in different parts of the world, with the object of mapping the entire heavens photographically near the conclusion of the present century. Surely there is urgent need of convening the congress now proposed by Dr. Gill, and very material advancement of scientific interests would follow.

—Between Mr. W. E. Hall's 'Foreign Powers and Jurisdiction of the British Crown,' which has just issued from the Clarendon Press (New York: Macmillan), and Mr. Piggott's 'Exterritoriality' of two years ago, the British lawyer and the British consular and diplomatic agents are now fairly equipped with specialized treatises in that rather indefinite field. In the part relating to Eastern States ("Oriental" would be a much better term) Mr. Hall's book in its subject would seem to overlap Mr. Piggott's; but somehow we appear to have two thoroughly different books. In looking for light on one or two of the topics made important by current events, we notice that Mr. Hall well says (p. 191), of the powers of consular courts, that they "spring remotely from a delegation made by a sovereign of the territorial state"; yet one would not suspect that this involves the fundamental and much-disputed question of the theory of exterritoriality, and for a full vindication one must seek Mr. Piggott's book. On p. 193 we read that "the territorial sovereign, if he chooses to bring an action in it [the consular court], submits himself, by doing so, as absolutely to the jurisdiction as any other litigant." But in a very important respect this sentence may or may not be law, according to the decision to be given before long by the Privy Council in the *Chishima-Ravenna* case, which is likely, through the imperial rank of one party and the profundity of the principles involved, to be one of the noted cases of modern times. The chapter on "Protectorates, Spheres of Influence, and Barbarous Countries" is timely, and says what can be said of a subject as yet undeveloped and sadly in need of common-sense and systematic regulation. The instinct of the Anglo-Saxon race to hold back from settling a legal incongruity until it becomes unendurable, and its readiness at any time to sacrifice plain justice to respect for nightmare technicalities, are seen to great advantage in these questions of jurisdiction and conflict of authorities; and this chapter will cause the unsophisticated reader to wonder whether, after all, the refinements of "civilized" justice do the world any better service than the legal crudities of "barbarous" countries.

—M. Jules Lemaitre, in one of his recent "Figurines"—a title he gives to a series of very pleasant little impressions which he is contributing to the *Temps*—says that the fame of Virgil in France rests in great part upon three fine sentences which are in everybody's mouth, and which constantly renew his memory. The first of these is the sibylline verse:

Magnus ab integro sæclorum nascitur ordo.

This, he says, is almost always mangled in quoting, and appears as "Novus rerum nascitur ordo." The second is what he calls the "inevitable" "Sunt lacrimæ rerum," which, ever since the time of the early Romanticists, has been intrepidly mistranslated. "Les choses elles-mêmes ont des larmes" is what they take it to mean, and some are fain to as-

sert that they find the whole sum and substance of modern poetry in the phrase. The last quotation of the three is cited in French only: "On se lasse de tout, excepté de comprendre." This is certainly a fine saying, worthy of Sainte-Beuve or of Renan. It possibly belongs to Virgil, for Virgil is often enough surprisingly modern in his thought. Silenus, in the Eclogue, is a good enough evolutionist, and the pantheism of Father Anchises in the sixth 'Æneid' is above reproach. But we cannot be sure that the saying is Virgil's, since it does not appear in any work known to be his, though it is attributed to him by the commentator Servius. It appears, then, that Virgil's popular glory in France rests upon two misunderstandings of his words and one uncertain tradition. It may, however, be said of the misquotation, "Novus rerum nascitur ordo," that it is not quite made up out of the whole cloth. The line in the fourth Eclogue, which M. Jules Lemaitre quotes, may easily have been confused with a line in the seventh 'Æneid,' "Maior rerum nascitur ordo," which fits the French quotation somewhat more closely, and which may not have been in M. Lemaitre's mind as he wrote.

—There is grist for many mills in Strabo's geography, but his colossal work is rather for reference than for reading. It must be confessed, however, that Mr. Tozer's 'Selections from Strabo' (Oxford: Clarendon Press; New York: Macmillan) are really readable as well as a serviceable introduction to the merits of the most scientific and important of ancient geographers. Strabo's accurate powers of observation and description, his fund of legend and folk-lore and historical tradition, are well exemplified in these excerpts made by an editor who has travelled widely with Strabo in his hands. Not only the student but the traveller who retains some tincture of Greek may dip into this volume and find a true spirit of scientific research—descriptions as accurate and authentic as Baedeker's mingled with anecdote and legend and an occasional spice of Marco Polo. The selections, chosen from each of the seventeen books, offer characteristic tours, as it were, in Europe and Asia. In Gaul, for instance, the pious Stoic points out the advantageous arrangement of the river system, which he considers an evident mark of "Providential design and harmony"; he has a word to say of the Gallic character, its proneness to gasconade, its aptness for civilization, although just emerging from the period of bards and Druids and human sacrifice, when "a good crop of criminals laid in the ground was popularly thought to bring a good crop of grain"; finally, he can tell of Marseilles that it had already become a resort for distinguished Romans, and the rival of Athens in learning and culture. In other passages, we may turn from a careful description of the craters of Vesuvius and Etna to the mention of the Camaræ of the Black Sea, or of the snowshoes, glissades, and tobogganing on the Caucasus. In the midst of an enumeration of the natural and artificial conveniences of the site of Rome, we light upon a remark so acute and characteristic as the following: "Whereas the Greeks in their settlements looked to the natural beauty and strength of sites and harbors, the Romans gave heed to what the Greeks neglected—that is, to the building of roads and drains and aqueducts." This exemplifies the scope, variety, and interest of Mr. Tozer's selections from a treatise teeming with important facts. The details of some of these are constantly shifting under the light of fresh discovery and explorations. For example, "the fourteen vertical shafts between the Copais lake and the sea" (note, p. 237) are now reported by M. Kambanis as sixteen. But in general Mr. Tozer has been able to avoid treading on "the hot ashes" of recent controversy. The preface, the foot-notes, and the maps provide much helpful matter for the elucidation of Strabo's life, his style, and the points of topography and geography involved in the extracts.

## WHARTON'S REVOLUTIONARY DIPLOMATIC CORRESPONDENCE.

*The Revolutionary Diplomatic Correspondence of the United States.* Edited under direction of Congress by Francis Wharton, with preliminary index, and notes historical and legal. Published in conformity with Act of Congress of August 13, 1888. (Six volumes.) Washington: Government Printing Office. 1889.

ALTHOUGH the title-page of these volumes bears date 1889, the work was not really issued from the Government Printing-Office until within the last six months, nearly five years after the death of the distinguished editor. This fact ought to acquit him of responsibility for such errors of the press as appear in the work, since it is improbable that he supervised the proof-reading. A few of these errors may be noticed at haphazard. In the last paragraph of the preface the date 1816 is given with reference to Sparks's publication of the Revolutionary correspondence, instead of 1829, the date of the first Boston edition; on page 443 of vol. i. a sentence reads without sense because of the omission of the word "owing"; further on we find "Russeau" for "Rousseau"; and on page 511 the text says that of the zeal of John Adams there could "be question," which is doubtless meant to read "no question." Errors of this kind are numerous, and are the more to be regretted as they are found in a publication of rare historical value.

The first volume opens with a discriminative and appropriate sketch of Dr. Wharton's life by Prof. John B. Moore, and this is followed by Dr. Wharton's last essay, 'Patches on the Constitution,' from the *Independent* of January 10, 1889, an insertion which was never contemplated by the editor, and which might easily have been omitted without lessening the value of a work with which it has no real connection. The rest of this volume, if not the most valuable, is certainly the most interesting of the whole work, for it embodies in narrative form Dr. Wharton's own version of the diplomatic history of the Revolution.

The two parties of the Continental Congress were, according to his definition:

"(1.) The 'liberative' or 'expulsive,' whose sole object was to get rid of British authority, and which, from abhorrence of the British executive, had come to regard all executive authority as a tyranny; and (2) the 'constructive' or 'remedial,' whose members sought to set up a constitutional system of coördinate legislative, executive, and judiciary, in the place of the British Government."

The first school sought to govern through congressional committees, and believed that "earnest, untutored force would, in every contest, crush the minions of the despot. By the other school it was believed that force without system must, sooner or later, succumb to system directing force." Of the first school Samuel Adams was the leader, and to it John Adams belonged, until after the Revolution, when his views changed and he became a strong advocate of the constructive policy. Their chief coadjutors were the Lees. The chief of the "constructives" was Washington, and next to him came Franklin, the most prominent of their associates being Robert Morris, Robert R. Livingston, and John Jay. Jefferson and Hamilton, Dr. Wharton thinks, were both of the constructive school during the Revolution, their antagonism not developing until they were "pitted against each other like fighting-cocks" in Washington's cabinet.

Taking up the conduct of military affairs, the author declares that "the Lees and Adamses"—that is, the "destructives"—favored the militia system, while the "conservatives" favored regular troops enlisted for the whole period of the war. The same principle extended to the Revolutionary diplomacy:

"On the one side it was maintained that our relations with foreign nations ought to be freed from the artificial shackles which international law had imposed, and that we should approach them with blunt simplicity, demanding not only recognition, but aid. In other words, 'militia,' to use John Adams's illustration, 'sometimes gain victories over regular troops, even by departing from the rules.'"

The result of this "militia diplomacy" was humiliating, and was only saved by Franklin from being disastrous.

After discussing the case of the revolutionists against Great Britain, and her attitude towards the United States, from an extreme anti-British standpoint, Dr. Wharton examines the attitude of France towards this country. He traces the desire to assist America to the treaty of 1763 between France and England, by which the former lost Canada, certain West India Islands, and the domination of India. After this, France watched for an opportunity to retrieve her humiliation. Vergennes, therefore, "favored the American insurgents merely as engines for breaking down British supremacy, not as propagandists of cosmopolitan republicanism." But

"other motives came in and exercised a decisive influence. . . . There was, again, an enthusiasm among the young nobility and among officers in the army for America, which, even aside from the bitterness towards Britain with which it was mingled, had great effect on people as well as on court; and to this was added the sympathy of doctrinaire political philosophers who then and for some time afterwards had great power in forming French public opinion. By the enthusiasm of the young nobility the Queen—brilliant, bold, weary of the traditions of the old court, inconsiderate as to ultimate political results—was affected, and through her her husband was reached. But above this was the sense of right, which was uppermost in the breast of the unfortunate sovereign who then, with little political experience but high notions of duty as well as of prerogative, occupied the throne."

In order to help the American cause, the French Government secretly established, through Caron de Beaumarchais, the fictitious firm of "Hortalez & Co.," for the purpose of "selling" military supplies, and it was with Beaumarchais, the "merchant," that Silas Deane had his first material transactions. This episode Dr. Wharton dwells upon at some length, and it is one of the most interesting of the sections of the introduction. The correspondence itself is printed in the second volume. Much of it was omitted from Sparks's earlier work, and appears here for the first time. Similarly, the movement to have Count de Broglie appointed commander-in-chief of the American forces—a topic to which Sparks, for reasons which were probably justifiable at the time of his editorship, excluded all allusion—is brought out. Under date of Decem-

ber 6, 1776, Deane wrote to the committee of secret correspondence as follows:

"I submit one thought to you, whether, if you could engage a great general of the highest character, in Europe, such, for instance, as Prince Ferdinand, Marshal Broglie, or others of equal rank, to take the lead of your armies—whether such a step would not be politic, as it would give a character and credit to your military, and strike, perhaps, a greater panic in our enemies. I only suggest the thought, and leave you to confer with Baron de Kalb on the subject at large."

Kalb was preparing for his voyage to America at the time, and seriously believed that it would be possible for Broglie to be made temporarily a dictator in America; but he abandoned the whole idea as soon as he realized, from actual contact with them, the temperament and character of the revolutionists. The incident is chiefly interesting as showing the stupidity of our own representative in France.

After considering the attitude of Spain and other European states towards the United States, Dr. Wharton gives brief commentaries upon the Americans identified with the diplomacy of the Revolution. Of Franklin's despatches he says:

"It is questionable whether any diplomatic papers equal to them exist. They do not give, it is true, the exhaustive views of local politics which are to be found in Jay's letters from Spain, nor the elaborate summaries of European news to be found in the letters of Adams from Holland. They have not the element of gossip which made Malmesbury's Russian letters so entertaining, nor do they indulge in a rhetoric so majestic as that we meet in some instances in the papers of Webster. But for fitness for the purpose for which they were written, it may be questioned whether, taking them as a body, there are any diplomatic papers equal to them."

With Franklin, John Adams had no sympathy, and he became inordinately jealous of the lion of Paris. While giving Adams full credit for his great services in the Revolution, Dr. Wharton declares his nature unfitted him for diplomatic duties. Arthur Lee, on the other hand, is left with only his personal honesty as a redeeming quality. The correspondence shows him to have been of poor judgment, ambitious far beyond his deserts, of a jealous, insubordinate disposition. He was a positive injury to the cause as long as he had any connection with its diplomacy. Of Silas Deane Dr. Wharton says:

"Whatever we may think of Deane's early services in the Revolutionary cause, there is no doubt that he left Philadelphia [after his recall from his mission] thoroughly embittered by the unjust and insulting course of Congress towards him, and that, on his return to Europe, he soon fell under British control and accepted British pay."

To prove this, George III.'s letters to Lord North are quoted, in one of which the King speaks of Deane having been intrusted with £3,000 "in goods for America."

Of Robert R. Livingston, the first secretary for foreign affairs, who conducted the most important Revolutionary correspondence after 1781, Dr. Wharton gives the opinion that he "possessed not a few of Franklin's characteristics," and "did more than any one in the home Government in shaping its foreign policy."

A few words are devoted to the "British spies," and here it may be noticed that in speaking of Paul Wentworth the author has apparently entirely overlooked the conclusive evidence of his having been in British pay to be found in Stevens's 'Facsimiles of Manuscripts in European Archives relating to America.'

The correspondence embodied in the five succeeding volumes was gathered chiefly from the archives of the Department of State, and it is no reflection on Mr. Sparks's pioneer publication of sixty-three years ago to say that it is given now in a fuller and more satisfactory form than it was then. Other MS. sources are the Franklin correspondence in the American Philosophical Society at Philadelphia, the collection of the late George Bancroft, the John Paul Jones papers in the Library of Congress, the papers of Arthur Lee in Harvard College, the American Philosophical Society and the University of Virginia, and the extensive Sparks Collection in Harvard College. Of course, the diplomatic correspondence of the Revolution will never be complete until the intercepted despatches now in European archives have seen the light of day; but what we have here is undoubtedly one of the most important contributions to the history of the Revolution that have appeared for many years.

## A MOUND OF CITIES.

*A Mound of Many Cities;* or, Tell el-Hesy Excavated. By Frederick Jones Bliss, M. A. Macmillan & Co. 1894.

TELL EL-HESY is an ancient ruin mound in the rolling country "between the foot-hills of the rocky Judæan mountains and the rich plain of Philistia, sixteen miles east of Gaza, a little to the north and twenty-three miles west of Hebron," generally supposed to represent the ancient city of Lachish. This site was selected for exploration in the spring of 1890 by Dr. W. M. Flinders Petrie, because its steep eastern side offered an opportunity of examining each stratum of its accumulated ruins without the necessity of digging down from the top. His excavations themselves were small and the "finds" insignificant, but Dr. Petrie knows how to make every potsherd speak. The mound was 120 feet in height, the lower 60 feet attributable to the hand of nature, the upper 60 consisting of the débris of a long series of cities, built for the most part of unbaked brick or adobe. This series of cities, the explorer concluded, covered a period of at least 1,200 years, from an "Amorite" city of about the seventeenth century down to a post-Israelitish city of the fifth century B. C.

It was in consequence of these excavations of Dr. Petrie that the directors of the Palestine Exploration Fund resolved to conduct more systematic and extensive excavations at this point. After much difficulty a firman was obtained, and Mr. F. J. Bliss, son of Dr. Bliss of the Syrian Protestant College at Beirut, was chosen to take charge of the work, a man who to a thorough American training adds a familiarity with the Arabic language and an intimate and sympathetic acquaintance with the people of the country, due to early and long residence among them. This little book of 201 well-spaced pages is the record of the excavations conducted by Mr. Bliss at Tell el-Hesy in the years 1891–'93. Mr. Bliss states that his object in writing the volume "has been to present facts with as slight an admixture of theory as possible"; and he has adhered to his purpose quite consistently. The book is a concise and exact statement of the results of his excavations, but told with such admirable logical and literary skill that the facts embody their own theory, the scattered bones gathering themselves together to form a complete skeleton, apparently of their own volition. The first chapter, "The Anatomy of a Tell," explains what is doubtless a source of perplexity to many even of those who have read much about the excavations of ancient ruins, how a ruin mound grows, in what way débris comes to be heaped up, and how excavations are or ought to be conducted, and the objects found interpreted. This chapter is really a valuable monograph in popular language on the subject of ruin mounds and the proper methods of excavation.

Following this are four chapters in which Mr. Bliss deals with the eleven cities whose remains he found in the mound, starting at the bottom and coming upwards, following the logical order instead of the order of discovery. His method of excavation, undoubtedly the best to be pursued in excavating a mound of the size and character of Tell el-Hesy, was to cut a great slice out of the side of the mound, very much of the shape of a quarter section of a pie, and study this carefully by strata, excavating one stratum entirely before proceeding to the next. Owing to the precipitous character of the eastern side of the mound, this could be done with peculiar ease at Tell el-Hesy; and the dirt removed, once thrown over the edge of the cliff, was in no danger of proving later to have been deposited on some spot important to be excavated, as is so often the case in the best conducted excavations. These chapters are provided with plans of the ruins laid bare in the excavations, so arranged as to admit of easy comparison one with another, and admirably supplied with cuts of the objects found, which are explained and commented on in the text.

The sixth chapter, "The Chronology of the Tell," deals with the dates of the cities unearthed and the method of determining those dates. Mr. Bliss found but few inscribed objects—one inscribed clay tablet, a couple of insignificant Greek and Phœnician inscriptions on pottery, consisting of a few letters only, and some Egyptian scarabs. Outside of these he was compelled to rely on the succession of strata and the amount and character of débris in each, on the pottery found, and on the use of iron, bronze, and stone utensils. In fact Tell el-Hesy was very barren in archæological finds, but what was found has been treated with great skill, so that Mr. Bliss is able to give a sort of synopsis of the history of the place, assigning to each city a fairly well-established date. The lowest city, agreeing with Dr. Petrie, he assigns to a period at or before 1700 B. C. It precedes, therefore, by some centuries, the occupation of the country by the Israelites. The four following cities also belong to the period preceding the Hebrew conquest. It was in the last of these, numbered "City III." by Mr. Bliss, according to a very cautious plan which recognizes a "Sub. I." and a "Sub. II.," that he discovered the tablet with a cuneiform inscription which was the most important find of his expedition.

In an article published in the Journal of the Society of Biblical Literature and Exegesis in 1887, it had been pointed out that in the thirty-second chapter of Jeremiah, in the account of the purchase of a piece of land by Jeremiah from Hanamel, his cousin, the original text shows that the record of the purchase was written on a clay tablet, covered with an envelope of clay, on which the contract was repeated, enclosed in an earthen jar, and buried in the earth, after the method pursued in Babylonia. From this the writer argued that the Hebrews had the same method of writing on clay as the Babylonians, and that some day inscribed tablets would be found in Palestine. Prof. Sayce had already reached the same conclusion on other grounds, particularly because

of the discovery of clay tablets inscribed with cuneiform characters in Cappadocia, and at Tell el-Amarna in Egypt. It was in the autumn of 1877 that a peasant woman discovered at Tell el-Amarna those famous 320 clay tablets inscribed with Babylonian cuneiform script. They proved to be letters written by various potentates to the Egyptian king, and among them were letters from the Egyptian governors of various subject cities, including Jerusalem, Gaza, and other Palestinian towns well known in Bible history. In these letters mention is made of a certain Zimrida, who was Governor of Lachish for the Egyptian King about 1450 B. C. The tablet found by Mr. Bliss at Tell el-Hesy was of the same general appearance as the Palestinian tablet found at Tell el-Amarna, written in the same script and composed in the same dialect. The name Zimrida also occurs in this tablet, but, owing to the mutilated condition of the inscription, it is impossible to determine certainly whether it was written to Zimrida or by him or about him, and Mr. Bliss does not feel, therefore, that this discovery settles finally the question whether Tell el-Hesy is Lachish or Eglon, which seems to be the possible alternative. As the first cuneiform tablet ever found in Palestine, this possesses a peculiar interest. It is also by many centuries the most ancient inscription yet found in any part of the Holy Land. In view of what we now know about the use of such clay tablets in Palestine in the most remote period, it seems strange, not that one such tablet has at last been found, but that none were found earlier, and that only one was found. Prof. Sayce, meeting Mr. Bliss in Egypt before he began his excavations, assured him that he would certainly find tablets at Tell el-Hesy. Nevertheless, Prof. Sayce was almost incredulous when the discovery was first announced to him, and would not believe that the tablet was genuine until he had received and studied a squeeze sent to him by Mr. Bliss. Mr. Bliss, on the other hand, seems to have been more or less sceptical about tablets at the outset, but greatly disappointed when he found but one. However, archæologists everywhere recognize that the discovery of this one tablet has established beyond gainsaying that the systematic excavation of Palestinian sites will give us ultimately contemporary written documents of the times of the ancient prophets and kings of Israel. It must be remembered that outside of Jerusalem practically no excavations had ever been conducted in Palestine before.

This tablet dates the fifth city before the conquest of Palestine by the Hebrews, as already pointed out. The Israelite period probably began with the sixth or seventh city and continued through the ninth. Unfortunately there are no inscriptions from this period excepting four letters in Phœnician script on one potsherd and three on another, and seven Greek letters rudely scratched on the base of a lamp-stand. The last two cities, the tenth and eleventh, belonged to the period succeeding the exile. They are dated by Mr. Bliss at 500 and 400 B. C., chiefly on account of the polished Greek pottery ware found among their ruins, and his more complete excavations accordingly corroborate to a remarkable degree the conclusions reached by Dr. Petrie.

The seventh and eighth chapters are entitled respectively "Sketch of the Expedition" and "The Arabs and the Fellahin." They are delightful and amusing as well as instructive reading, and to the general reader will probably constitute the most interesting part of a very interesting book. In the former of these two chapters Mr. Bliss relates how, on receiving his appointment to conduct the expedition, he went to Egypt and spent a month with Dr. Petrie at the pyramid of Meydûn, watching "that most energetic of excavators," and studying his methods. It was towards the end of his stay there that Dr. Petrie's book, 'Tell el-Hesy (Lachish),' arrived, upon which Mr. Bliss "retired with it for two days into the sculptured tomb of Ra-Hotep, which furnished an atmosphere both artistic and serious, as befitted such archæological studies." That he profited by the book and by Dr. Petrie's instructions is evident from the work which he did; and he has told the story of that work as archæologists seldom succeed in doing, in a manner equally edifying to the savant and charming to the lover of good reading and pure English. He is, moreover, very modest and self-contained, and scarcely lets you see that he had any difficulties to overcome, or hardships or dangers to encounter, or serious illness to undergo.

It is gratifying to know that on account of the admirable manner in which Mr. Bliss conducted his work at Tell el-Hesy he has been selected by the committee of the fund to conduct the excavations at Jerusalem for which a two years' firman has been obtained. It is to be hoped that some day Mr. Bliss will have the good fortune to report the discovery in Palestinian soil, not of one inscribed tablet, but of a hundred; and if such tablets are not found at Jerusalem, they will be at Samaria, or Gaza or other similar sites, which ought to be explored before long, now that Turkish jealousy of any work in the Holy Land seems to be relaxing.

## A CAVALRY OFFICER UNDER WELLINGTON.

*The Diary of a Cavalry Officer in the Peninsular and Waterloo Campaigns.* By the late Lieut.-Col. William Tomkinson, Sixteenth Light Dragoons. Edited by his Son. London: Swan Sonnenschein; New York: Macmillan.

THIS volume is full of interest, especially to the student of military history. The Diary is remarkable for its simplicity and directness, as well as for its evident accuracy and for the absence of all exaggeration. It is accompanied by portraits, maps, and a plan of the field of Waterloo.

William Tomkinson, the youngest son of a Cheshire squire, joined the Sixteenth Light Dragoons, now called the Sixteenth Lancers, just a year before the opening of the campaign in Spain and Portugal. His regiment left England in April, 1809, and, shortly after landing at Lisbon, was, with the rest of the British army, reviewed at Coimbra by Sir Arthur Wellesley, afterwards Duke of Wellington. The inhabitants of Coimbra, dreading the ravages of the French, received the British troops with acclamation, and showered flowers upon them as they marched through the city. The French were indeed ruthless in their destruction of fine buildings. Tomkinson says that they employed regular working parties, who used scaffolding to reach the tops of the decorated pillars. He adds, in reference to the great convent of Alcabaça: "It exceeded anything I ever saw as a work of destruction. They had burnt what they could, and destroyed the remainder with an immense deal of trouble. The embalmed kings and queens were taken out of their tombs, and the fine tesselated pavement picked up."

Soult, in command of the French, was then at Oporto, and the British forces, amounting to some 17,000 men, advanced from Coimbra without delay. In almost the first skirmish Tomkinson, then only nineteen, was severely wounded. His life was saved by his horse, which went full gallop to the rear. Although shot in the neck and through both arms, he kept his seat until out of the range of the enemy's fire. He suffered greatly from his wounds, and for some time could get nothing but tallow as a dressing. After the lapse of a month the surgeon found that one of the large plated buttons, weighing nearly half an ounce, on Tomkinson's jacket had been driven by a shot into the fleshy part of his left arm. When the button was removed he felt instant relief, but he had to be invalided to England. Always hardy, he declared that his own recovery, like that of other severely wounded officers, was due to the scanty fare and the little rest, or frequently none at all, which they got. The surgical knowledge of the present day would probably not support his opinion. During his voyage home, which lasted a month, the forty-five French prisoners on board the transport were more than once on the point of overpowering the English crew and passengers, who numbered fifteen in all, and taking the vessel into a French port.

Tomkinson was soon back from his enforced rest. During the remainder of the Peninsular campaign the duty was very severe. Officers and men seldom undressed, but slept on the ground close to their horses, which were kept bridled all night. Tomkinson does not give his opinion of the French marshals, but Wellington was accustomed to say that although Clauzel was, on the whole, the most formidable, he could never sleep comfortably when Masséna was in the field. Wellington thought that Marmont, otherwise an excellent general, was apt to spread his army too much. This caused his defeat at Salamanca, for Wellington made a sudden attack on the French centre with his whole force, and, as he said, "defeated forty thousand men in forty minutes." Soult complained that there was no beating the British soldiers, for they would not run; and when Badajos fell he was so much enraged that he broke all the plates and dishes in his house. The French troops subsisted entirely on the country, requiring from the Portuguese rations for their men and forage for their horses, besides taking every baggage-animal they could find, all without payment. The British forces drew nearly all their supplies from England, through Lisbon, and paid ready money for whatever they bought in Portugal. The French burned every town and village through which they passed, and killed numbers of the peasants. The English soldiers not unfrequently found the dead body of a peasant at the bottom of one of the large wine casks out of which they had been drinking. The Portuguese endeavored to hide their grain, but the French generally discovered these stores by flooding the houses and digging in the places where the water sank. Tomkinson considered the advance of the British army through such an exhausted country a wonderful exploit. From October, 1810, to the following April he did not see one village in which the inhabitants had remained; they flocked to the towns, where many died of fever, and more of starvation. The English officers gave them soup and bread once a day, and Tomkinson says that this single meal enabled many to walk who had not been able to move from weakness. The British troops also suffered from want of food; meat could be got, as the Portuguese were glad to part with the oxen which they could not feed, but there was

scarcely any bread or biscuit. The horses were frequently eight or nine days without corn; they ate the straw out of the peasants mattresses, and then were reduced to withered grass, which, according to Tomkinson, "they ate with so much avidity that they swallowed many of the stones at the roots, and died in consequence."

Wellington was very popular with his troops. Some of the soldiers called him "that long-nosed beggar that licks the French." He was up every morning at six, and wrote till breakfast at nine. He saw officers and received reports until three, then rode till six, and wrote again from nine till midnight. One of the commissaries complained to Wellington that Gen. Crawford had threatened to hang him if the supplies were not produced by a certain time. Wellington replied, "Then I advise you to produce them, for he is quite certain to do it." Tomkinson gives careful accounts of all the battles and sieges during the Peninsular war, at most of which he was present. Some of the storming parties at Ciudad Rodrigo found that their ladders, made out of a rotten Spanish car, gave way; they stuck their bayonets into the sod walls, and by that means carried the works. Mrs. Dalbiac, the wife of an English colonel, accompanied her husband throughout the campaign, sleeping in his tent, or even in the open air. After the battle of Salamanca, when above five thousand of the troops under Wellington were killed or wounded, she passed the night on the field searching for her husband, who happily was not among the dead. Tomkinson adds: "I cannot conceive a more unpleasant position for a woman to be in, particularly at night." Tomkinson gives an interesting account of his friend Somers Cocks, a most promising young outpost officer, who seemed "to grow in his saddle." Cocks's men were devoted to him, and he was indefatigable in his duty. He was always careful of his men's comfort, and when nothing could be found in which to cook their beef, made a capital frying-pan out of the top of a French brass drum. Cocks was killed at the siege of Burgos, to the great regret of Wellington, who said that "if he had outlived his campaigns, which from the way he exposed himself was morally impossible, he would have become one of the first generals of England." Tomkinson rode the same horse, "Bob," through all the five campaigns in the Peninsula, and when, after nearly five years of service in the field, "Bob" was sent back to Cheshire, he knew his way at once to his old stable. He lived for many years, and carried his master with the pack of harriers which Tomkinson kept on leaving the army.

Tomkinson spent a year in England on the conclusion of the Peninsular war, and in April, 1815, he embarked for Ostend in order to take part in the Waterloo campaign. Wellington, when in the Peninsula, had said that if Napoleon had taken the command there his name alone would have been equal to an additional 40,000 men. Tomkinson observes: "Napoleon has only the Duke to beat that he may say success has attended him with every general in Europe. It is an anxious time." Tomkinson's account of the battle of Waterloo is particularly graphic and full of details. His regiment was the only cavalry regiment in the service that went through both the Peninsular and the Waterloo campaigns. For a day or two before the 18th of June, the day of the battle of Waterloo, the weather had been extremely wet. Tomkinson's regiment selected a field of clover-root as a dry spot, but it was soon knee-deep in mud; there were no tents, and the fires would not burn. Men and horses were drenched, but Tomkinson lay down in his cloak, and, having been up and hard at work since two in the morning of the 17th, managed to get a couple of hours' sleep. As soon as it was light on the 18th of June Wellington posted his troops. He had, according to Tomkinson, nearly 32,000 infantry and 7,000 cavalry on which he could rely; the cavalry being, as Wellington told Blücher, the finest in the world. Wellington's opinion of the Dutch and Belgian troops was not high. The Prince of Orange and the Spanish General Alava had served on Wellington's staff in the Peninsula. The Prince said to Alava, "Well, Alava, what do you think your Spaniards would have done had they been present at Waterloo?" Alava replied, "Your Highness, I do not think they would have run away as your Belgians did before the *first* shot was fired." Tomkinson adds that men belonging to the Netherlands troops would hasten to carry a wounded comrade off the field, and then begin plundering in the rear. The Netherlands and Hanoverian cavalry did nothing but plunder in the rear, riding alongside the road and cutting at the men in charge of the baggage. Tomkinson's regiment saved their baggage by their swords.

The whole of the field of Waterloo was covered with the finest wheat, and the ground was so deep that numberless shells burst where they fell, and many round shot never rose from the spot at which they first struck the earth, instead of, as usual, hopping for half a mile. It was past eleven on the morning of the 18th of June before the French army assembled. Tomkinson says: "We had not long been on our ground before the cannonade opened and became general along the whole line. . . . The cannonade continued along the line through the day." Repeatedly the artillery, charged by the French cavalry, "had to leave their guns and take refuge in the squares of infantry, and the instant the French cavalry turned to the rear they ran to their guns, firing at them in their retreat." Tomkinson describes the last desperate effort of Napoleon's Old Guard, which had overawed every other army by their steady regular advance. When the British infantry charged instead of retreating, the Old Guard "set off down the hill and were seen running away on every side in the greatest confusion." The pursuit ended at ten o'clock at night. Tomkinson calculated the strength of the French army as 66,000 infantry and 12,000 cavalry, not including 30,000 men under Grouchy, and he was convinced that, in spite of Napoleon's statement that Grouchy disobeyed his orders in not coming up on the 18th of June, Grouchy really had received positive orders to attack the Prussians only and to move on Wavre. On the morning after Waterloo, Tomkinson rode over the field, which he says had more the appearance of a breach carried by assault than an extended field of battle. The peasants for miles round had assembled, and were plundering all they could get, and stripping the wounded as well as the dead. On entering Paris, Tomkinson writes: "Looking at our present march to dethrone the great Napoleon, and our commencement on a strip of land in the lines of Torres Vedras, then the only army he had not subdued, and that army but a handful in comparison with his hordes in every part of Europe, we can scarcely believe ourselves the same."

Tomkinson, during his six years of active service, was at least a hundred times under fire, but he was only once wounded. The button which was on that occasion driven into his arm is still preserved: the shank, which the surgeon was most anxious to probe for, remains on the jacket. Tomkinson received the Peninsular and Waterloo medals, with clasps for the actions of Busaco, Fuentes, Salamanca, and Vitoria. He retired on half-pay in 1821, and in 1872 he died at the age of eighty-three. The Diary is dedicated to the colonel and officers of his old regiment.

---

*Arthur Schopenhauer's Sämmtliche Werke.* Six volumes.—*Arthur Schopenhauer's Nachlass.* Four volumes. Herausgegeben von Eduard Grisebach. Leipzig: P. Reclam.

"My curse on any one who, in future issues of my works, deliberately makes any changes in them, be it a period, or even a single word, a syllable, a letter, a punctuation-mark."

"I believe I can claim the honorable title of an *oligograph*, since these five volumes contain everything I ever wrote, and are the fruit of my seventy-three years of life. The reason is that I wished to be sure of the uninterrupted attention of my readers, and therefore never wrote unless I had something to say. Were this principle adopted generally, literature would undergo a great shrinkage."

The above sentences occur in a sketch of a preface to a complete edition of his works which Schopenhauer wrote shortly before his death, and which Herr Grisebach prints complete for the first time ('Werke,' vol. vi., 281). Schopenhauer made his apostle Frauenstädt his literary executor, although he knew him to be somewhat careless in citing from his works, and once wrote to him that he wished he had some of Kilzer's "noble fanaticism" for accuracy. On another occasion he thus admonished Frauenstädt: "Clip ducats and louis d'ors, but do not clip my sentences, as is now the fashion. I write as *I* write and no one else; here every word has its value and its necessity, even if you do not feel or recognize it."

Such being Schopenhauer's sentiments, it is easy to imagine his indignation could he have known how Frauenstädt would edit his works, and how much inaccurate and spurious matter would for thirty years be accepted as genuine. The expiration of the copyright on his works was the signal for the appearance of a large number of reprints of all or parts of them. Among these new editions by far the best and most authentic is that of Grisebach, who seems indeed to possess the "noble fanaticism" for accuracy which Schopenhauer desired in his editor. Grisebach has compared Schopenhauer's books word by word with the original manuscripts in the Berlin Library, and has ascertained that the older editions literally swarm with errors; indeed, he speaks of Frauenstädt's "inexcusably slovenly treatment of the text," and as he gives full particulars in each case, the reader is able to see that this is not too strong language. Not only did Frauenstädt adopt a different plan from Schopenhauer's (with which he was acquainted) of arranging the sequence of the different treatises, but he altered or suppressed sentences, added notes of his own, and either deliberately or from carelessness often changed the language and style. No less than 1,619 corrupt passages are enumerated, and, on pages 389–392, specimens are given.

Accuracy is by no means the only merit of this edition. It includes, in the four volumes of the 'Nachlass,' much admirable matter that has never been in print at all, or only in a mutilated condition. Volume six of the 'Werke' contains a concise biographic sketch of forty pages; Schopenhauer's own fifteen-page sketch of his life, in Latin, and 114 pages of bibliographic notes, which are a marvel of German

industry; and, most welcome of all, an excellent index of fifty-three pages, covering the six volumes of the 'Werke,' while the 'Nachlass' has another index for the remaining volumes. The first index is based partly on Schopenhauer's own index to his manuscript-books; and these entries are distinguished from those made by the editor by a difference in the type.

The first volume of the 'Nachlass' is a little book of 178 pages, containing Schopenhauer's translation from the Spanish of Balthasar Gracian's 'Oráculo Manual, y arte de prudencia.' It was made in 1832, but although it was infinitely superior to any other translation of this famous little book of maxims, and was commended as such by one of the leading Spanish scholars in Germany, no publisher could be found for it till thirty years later, when Frauenstädt had it printed. Grisebach's edition not merely is more correct, but includes a characteristic literary note of several pages, written by Schopenhauer for the publisher's instruction. In reading these maxims of Gracian, as in reading the works of Lichtenberg, one often comes across germs of ideas which Schopenhauer developed and presented in a new light in his own writings. Along with Kant, Plato, and Goethe, they appear to have been his favorite authors.

The second volume of the 'Nachlass' contains fragmentary matter relating to Schopenhauer's university lectures and his method; the last sixty-four pages being devoted to a violent onslaught on slovenly journalists and other murderers of the German language. These pages are by no means antiquated, as good taste is still painfully absent in most German writing, although much progress has been made since his death. The third volume is devoted to notes and comments, mostly brief, on Plato, Locke, Kant, and the post-Kantian philosophers. The appendix includes several letters written in English.

By far the most interesting and important of the volumes of the 'Nachlass' is the fourth, which the editor has entitled "New Paralipomena." It is longer than the others (510 pages), and consists chiefly of short and pithy aphorisms and paragraphs on philosophy, history of philosophy, the intellect, logic and dialectics, philosophy of nature, ethics, politics and law, death, pessimism, suicide, religion, style, criticism, authorship, etc. The origin of this collection is a matter of interest. It seems that Schopenhauer had among his MSS. ten bound ones which he called "manuscript-books," and which bore the following titles: Reisebuch, Foliant, Brieftasche, Quartant, Adversaria, Cogitata, Cholerabuch, Pandekta, Spicilegia, Senilia. In one of these, "Cogitata," he intimates that if he should not survive a new edition of his principal work, these writings should be printed as supplementary matter in confirmation and elucidation of that work. Fortunately he did survive it, and when the second edition was put into type, he inserted whatever he could find an appropriate place for. This process was repeated in his later books, all the matter thus transferred being crossed with a lead pencil. Much, however, remained unpencilled, and of this the new volume of "Parerga" is principally made up. It contains much that has never been in type before, and is on the whole one of the most suggestive and thought-stimulating of his works. Few of the paragraphs cover as much as a page, and we should not be surprised if this conciseness should make the new "Paralipomena" the most popular of all these volumes, as it will appeal to the large class whose limited knowledge of German or lack of time does not allow them to plunge into the more elaborate treatises. Here the reader will find samples, as it were, of all of Schopenhauer's idiosyncrasies and views—his unbounded belief in his own genius; his contempt for his contemporaries who ran after such "charlatans" as Fichte, Schelling, and Hegel, while ignoring him; his general pessimism; his love of art; his preference for Buddhism over Judaism and Christianity; his wonderful insight into psychological problems, and fearless exposure of shams and humbug; his admirably clear and graphic style, degenerating sometimes (especially when Hegel is in question) into blackguardism—and so on. It may be added that these ten volumes are neatly printed and bound (size 5½ by 4 inches), and cost, together, only $3.25 in Germany.

---

*The Voyages of Capt. Luke Foxe of Hull and Capt. Thomas James of Bristol* in search of a Northwest Passage, in 1631-2. London: Hakluyt Society. 1894. Maps and illustrations.

THE eighty-eighth publication of the Hakluyt Society, in two large volumes, comprises the voyages of Foxe and James to Hudson's Bay, edited, with copious annotations, by Miller Christy. The narratives of these two explorers are remarkable as being almost the first separately published English works describing voyages in search of a northwest passage. The narrations of most of their predecessors are incorporated in the collections of Hakluyt and Purchas. The volumes of Foxe and James describe explorations in the same region, undertaken in the same year and with the same object in view. Both have now become scarce and valuable, a perfect copy of either being very rare and worth a considerable sum. The reasons for reprinting them together in the series of the Hakluyt Society are, therefore, obvious. The work of Capt. James originally appeared as a small quarto of 150 pages in 1633. It consists entirely of an account of his voyage, and is chiefly remarkable for its exaggeration of the dangers of his navigation and wintering. Foxe's narrative was published in London in 1635; it is a small quarto of 275 pages, with the punning title of 'The Northwest Fox.' Less than half of the work is occupied by the author's account of his own voyage. The remainder comprises abstracts of the explorations of fifteen of the principal navigators who had preceded him in the search for a northwest passage from the earliest times. Many of them are of course derived from the collections of Hakluyt and Purchas, but three of them, relating to the discoveries of Gibbons, Hawkridge, and Sir Thomas Button, are of especial interest, inasmuch as they contain almost all the extant information respecting the voyages they describe. The explorations of Button are of much importance, and Foxe deserves no little credit for rescuing them from oblivion.

Hudson, as every schoolboy knows, had sailed westward through a noble strait some 600 miles, and had then entered the vast bay which bears his name. The eastern part of this he explored before (his provisions running low) the mutiny arose which cost him his life. It must have seemed to him probable that there were other passages leading from this bay or sea to the main Western Ocean. The mutinous survivors of his expedition on their homeward passage ran upon a rock near Cape Digges, and remained fast for about eight hours, when a "great floud (which they, by this accident, took first notice of) came from the westward and set them on flote." This flood or tide was regarded at the time as strong evidence of an opening into the Western or South Sea. In search of it, accordingly, Button at once set forth, proceeding with energy and discretion, and in all but his main object his exploration was remarkably successful. He completed the discovery of the whole coast line of Hudson's (or, as it was long known, of Button's) Bay, except that part between Cape Henrietta Maria and Port Nelson, where, however, no passage could be hoped for. He also, as noted prophetically by Purchas, "found the variation of the compasse to rise and fall in admirable proportion, as if the true Magneticall Pole might be discovered."

About three months after Button sailed, in 1612, the King granted to the Adventurers who had sent him out, a royal charter of incorporation as "The Company of the Merchants' Discoverers of the Northwest Passage," with Prince Henry as "Supreme Protector." After Button's return, though the disappointment must have been keen to those ardent seekers for a passage to Cathay, hope was not wholly quenched, and his voyage was followed by that of Gibbons in 1614 and those of Bylot, and Baffin, and Hawkridge. From 1619 to 1630 effort seems to have ceased, when in the latter year Foxe, who was a thoroughly able and judicious seaman of much experience, aided by Sir Thomas Button, Sir John Brooke, and Henry Briggs, the celebrated mathematician, made application through the Adventurers for the use of the *Charles* pinnace for a voyage of discovery on the west of Hudson's Bay. The grant was made, but, owing to the lateness of the season, Foxe did not sail until May 5, 1631. Meanwhile the friends of Captain James of Bristol were stirred into activity by the proposed voyage, and fitted out, with the endorsement of Thomas Roe, the ship *Henrietta Maria* on a rival exploration. James was an excellent astronomer but an indifferent seaman, though otherwise a man of more learning than Foxe. The *Henrietta Maria* sailed two days before its rival.

Foxe's crew was not left to him to choose, and he was hampered by instructions not the most judicious; his vessel appears to have been rather defective also. In spite of these disadvantages he carefully searched the west shores of Hudson's Bay, explored the hitherto unknown southern extreme, and then sailed northward and explored Foxe's Channel to lat. 66° 47′ N. Illness broke out among his men, so he turned back, late in September, and on the 31st of October reached England; in his own words: "I came into the Downes with all my men recovered and sound, not having lost one man, nor boy, nor any manner of tackling, having been forth neere six months." Mr. Miller Christy remarks with justice that this bears powerful testimony to the skill with which he had conducted the expedition. Yet, for sensibly returning in the same year that he sailed, Foxe was ridiculed and abused by those who either were partisans of Capt. James or losers by his failure to discover a passage.

James, in fitting out, though advised to the contrary, refused to take any men of previous arctic experience. He was well equipped, and everything he desired seems to have been liberally provided. His story is a veritable book of Lamentations; and the imminent perils to which he was constantly exposed, according to his own account, become almost comic in their monotony. He explored the west and southern shores of Hudson Bay and what is now known as James Bay, was overtaken by winter at Charlton Island, where he built several houses on shore and adopted the unique plan of sink-

ing his ship to preserve her from injury. Luckily he was able to raise her in the spring, and after various harrowing adventures, he reached Bristol October 22, 1632. He was well received on his return and appointed to a king's vessel in the Irish Sea, where he did good service. His death occurred in the spring of 1635, and a few weeks later Foxe followed him, being buried at Whitby July 20, 1635.

The present publication is in the usual excellent style of the society, and the editorial contributions of Mr. Christy, if less concise and clear than might be wished, will nevertheless afford a store of useful information to those whose studies lead them to make use of these volumes.

---

*Johnson's Universal Cyclopædia:* A New and Enlarged Edition. Charles Kendall Adams, Editor-in-chief; Assisted by a corps of thirty-six Editors, composed of the ablest and most distinguished scholars in the United States, etc. Vols. I.—IV. D. Appleton & Co. 1894.

JOHNSON'S CYCLOPÆDIA was first published in 1874, and was the first small cyclopædia which adopted the plan of many departments with a very eminent specialist at the head of each. There are advantages and disadvantages in such a plan. The great end which it is possible to bring about in that way is a broad and comprehensive view of human knowledge, by men who are able to inform us what is the present state of ideas in their several departments. The great danger lies in a want of unity, proportion, and consistency. Moreover, a large part of the substance of such a work, *e. g.*, the biographies, is not amenable to effective control by specialists. Hence the scientific portions of the original Johnson were much the best, and were peculiarly within the province of the editor, F. A. P. Barnard. In the new edition the Cyclopædia preserves a good deal of its spirit of life, and has been brought up to the times. We must say, however, that the last volume which has appeared, the fourth, while it is an improvement in some respects on those that went before it, is less like the original edition. It is a great mistake to suppose—if anybody does suppose so—that no great literary art is called for in a short cyclopædic article. There is no art in which success requires more peculiar original powers nor a more severe or longer training. It is safe to say there are not thirty real masters of it in this country to-day. But there are 300 contributors to the fourth volume of this Cyclopædia. Some of the least meritorious articles it contains, dreary and antiquated, bear very eminent and deservedly famous names.

Comparing the different departments of the work, if we must select one part as distinctly inferior to any other, it will be logic, which, though written by different hands, is pretty uniformly out of date and feeble. But incomparably the most interesting articles are those relating to linguistics. Those which carry the signature of Prof. Wheeler are all excellent, and there are others which really convey something worth remembering. The legal articles are very clear. The articles on physics are well enough; but there is nothing one will not find everywhere. The mathematics (excepting the débris of former editions) is not nearly so well done as the physics. The biological papers are of various degrees of merit. Some are very learned, others very instructive. The plan of distributing the biography among the thirty-six editors does not work well, especially in the case of living persons. The illustrations, which are confined to wood-cuts in the text, are of a wide range of merit. The maps will not bear comparison with those of Brockhaus.

This new edition, being in eight volumes and costing $48, can no longer be reckoned among the small encyclopædias. It has about as much matter as the new edition of 'Brockhaus's Konversations-Lexikon,' in sixteen volumes, and the total price is the same. There is still room for a methodical encyclopædia, not too large to be read through by an industrious person, say, in a year, and readable, withal; a work which should aim to convey information of large truths rather than of minute facts, and which should be written with something like the Peter Parley art, so as to be read with pleasure by old and young—the whole to be the product of not more than half-a-dozen masterly pens.

---

*Victor Hugo après* 1852. Par Edmond Biré. Paris: Perrin & Cie.

WE have here the fourth and last volume of M. Biré's *éreintement* or showing-up of Victor Hugo. There is not much left of the great poet, and nothing at all of the man, when M. Biré has done with him. In the brief preface to the present volume, the author tells the story of his work, begun, he states, through admiration of the poet and continued through love of truth. No doubt M. Biré is sincere in thinking and saying that love of truth has alone actuated him, but no reader can be long in coming to the conclusion that M. Biré soon blinded himself to his own motives as thoroughly as Victor Hugo to his. The vindictive animus is too plain, especially in this last volume; the writer plays too evidently the part of *advocatus diaboli:* he takes a savage pleasure in blackening the private character of a man who was the idol of France and is one of her greatest literary glories. He presents his facts and construes them like a special pleader. He has allowed himself to be drawn, almost unconsciously, into a virulent defaming of a great name under pretext of revealing to the world the true Victor Hugo. It is this virulence of speech, this vindictiveness of purpose, which minimizes the value of the work. That Hugo had many faults, that he was outrageously vain, that he had been a weathercock in politics, a shallow thinker, a follower instead of a leader of men, that his private life was not above reproach, others, more temperate than M. Biré, had already told the world and in a more decorous and convincing manner. That much of Hugo's work is poor, a large part ridiculous, that his drama has, in the main, lost its hold on the public, and that his novels are not models of their kind, able critics have long since fully stated. The fierce light which, in M. Biré's book, beats upon the poet, brings out startlingly every defect of the man and his works, magnifying and even darkening them, and, at the same time, destroying by its glare the real and numerous beauties which these works contain.

Faguet and Morel-Fatio, to name two only, drew sufficient attention to the weak points of Hugo as a writer, a scholar, and a man, and their criticism is on its face unmarked by bitterness. The mass of information collected by M. Biré in his four volumes is of high and undoubted worth—no student of Hugo and of romanticism can afford to ignore it; but it could and should have been presented with impartiality and a just sense of proportion. M. Biré quotes an approving notice of his first volume, 'Victor Hugo avant 1830,' by M. Brunetière, but in his method of quoting he sins precisely as Hugo sinned, for he says nothing of the qualifying remarks of the great critic, and he makes no mention whatever of M. Brunetière's admirable review of the next two volumes, 'Victor Hugo après 1830,' which was published in the *Revue des Deux Mondes* of October, 1891. Nevertheless, students of French literature are indebted to M. Biré for the information he has supplied, which will enable them better to understand and appreciate the work of Hugo. Bearing in mind the reservations which must absolutely be made in reading this volume, as well as the three preceding ones, there is large profit to be had from the series.

---

*Slav and Moslem.* By J. Milliken Napier Brodhead. Aiken, S. C.: Aiken Publishing Co.

THE natural inference from the title of this work would be that it dealt with the relations of the Russian and Turkish Empires, with possible side glances at the difficult questions connected with the Balkan Peninsula. The reader who begins it with any such delusion will be severely disappointed. It is a hotch-potch of Russian history, with no excuse for existence. Large slices of Rambaud's 'History of Russia' are copied and juxtaposed in a manner which amply deserves the inelegant term higgledy-piggledy; the result being often that events are wrenched out of their connection and hurled into impossible attitudes a hundred years or more away. Writers upon Russia of the most miscellaneous description have been drawn upon with little discrimination, and their utterances have been combined in the most bewilderingly incoherent, crazy-quilt pattern, both as to chronology and correlation, which it has ever been our fortune to witness. Nearly every proper name in the book is spelled wrong, and there is no uniformity of spelling, even in such ordinary words as Czar, Tzar, Byzance, Byzantium; while grossly careless errors like "Herzegovonia" are lamentably frequent. Every time that the writer "Stepniak" is referred to, what the author supposes to be his real name is supplied in parenthesis, and is always wrongly spelled. It is time that the public understood that Prof. Dragomanoff and "Stepniak" are not identical. The blame cannot be laid on the printers, though the proof-reading is as remarkable as the rest, and though the punctuation is of so extraordinary a character that Lord Timothy Dexter's plan of having none in the body of the book and a large assortment at the end seems preferable.

---

*A Student's Text-Book of Botany.* By Sidney H. Vines, M.A., D.Sc., F.R.S., Sherardian Professor of Botany in the University of Oxford. First Half. London: Swan Sonnenschein & Co.; New York: Macmillan. 8vo, pp. x, 430.

ABOUT fifteen years ago there was published, under the supervision of Prof. Vines, an English translation of Prof. Prantl's 'Lehrbuch der Botanik,' an elementary text-book which had already met with considerable success in Germany. When it became necessary to revise this translation, it appeared best to Prof. Vines to increase the matter of the book considerably, so "that while retaining all that has made it of value to beginners, it might be more useful to those engaged in the advanced study of the science." The result is, that in this first half the portions covering 130 pages in the edition of 1881 have been rewritten and augmented until they have come to occupy 430 pages. Consequently, while the general

plan and treatment are retained, this revision has resulted in practically a new book emanating from an English rather than a German source.

The volume just issued contains Part I., on "Morphology," Part II., on "The Intimate Structure of Plants," and Part III., on "The Classification of Plants," up to the flowering plants, the classification of which, together with the chapters on physiology, are to appear in the second half. The chapters on morphology and histology are very carefully rewritten and the treatment is consistently comparative throughout. The embryological characteristics are everywhere properly considered, and are given their due prominence in the arrangements and discussions which follow. This comparative method, which has not been employed either so fully or so harmoniously in any English or German text-book before, has necessitated the use of a considerable number of technical expressions taken directly from special treatises and not familiar to the average student. With the aid of such terms, carefully selected, the homologies of the various structures among the higher plants are accurately and concisely indicated in phraseology readily intelligible; and the adoption of these terms in a text-book destined to be widely used will help greatly toward putting the comparative anatomy of plants upon as firm a basis as that secured by zoölogists for the animal kingdom.

This volume is compact and handy, the typography is excellent; the illustrations are all familiar, but are duly accredited, and introduced with excellent discrimination. It is to be hoped that the second volume, with index and glossary, will soon be forthcoming.

---

*An Historical Geography of the British Colonies.* By C. P. Lucas. Vol. III.: West Africa. With maps. Oxford: Clarendon Press; New York: Macmillan. 1894. 8vo, pp. 283.

THE story of the West African colonies forms the least creditable chapter in the history of modern times. It is the record, not of victories of civilization over barbarism, of the development of natural resources, of the foundation and upbuilding of states, but of mere mercantile enterprises, in which the principal source of gain for more than two centuries was human lives. The colonies still consist mainly of detached trading settlements in which neither manufacturing, agriculture, nor mining is encouraged. This condition is, no doubt, largely owing to the climate, but it is also an inheritance of the slave trade, which stereotyped savagery and paralyzed industry. In the first half of the volume before us the operations of all the European nations, the Portuguese, Dutch, and French, as well as the English, on the West Coast, from its discovery to the present time, are narrated. This general review is followed by separate chapters on the different British colonies, the Gambia, Sierra Leone, the Gold Coast, Lagos, and the Niger Protectorates. From this it appears that the most satisfactory condition is to be found in Lagos, the least in Sierra Leone. Among the extraordinary variety of races which people the latter (sixty different languages are said to be spoken in the streets of Freetown), Mohammedanism is increasing more rapidly than Christianity, education is making no progress, and, at a short distance from the coast, slavery and barbarism are rife which the civilized natives make no effort to overcome. This is a disheartening outlook, especially considering the peculiar interest attaching to this colony as the headquarters in Africa of the abolition movement.

A short but interesting account is given of the islands of the South Atlantic, Ascension, which is garrisoned by marines and rated as a ship of war, and St. Helena, whose decrease in importance and consequent gradual decay since the opening of the Suez Canal is the most noteworthy fact, and Tristan d'Acunha and Gough Island. Several useful maps and lists of reference books and an excellent index add to the value of this volume, which contains, besides historical facts, accounts of the government of the various colonies, their present commercial condition, and their relations to the rest of the world.

---

*Oliver Cromwell:* A History, comprising a narrative of his life, with extracts from his letters and speeches, and an account of the political, religious, and military affairs of England during his time. By Samuel Harden Church. With portraits and maps. G. P. Putnam's Sons. 1894. Pp. 524, 8vo.

"WHEN reading Hume's 'History of England' some years ago," says Mr. Church, "his severe treatment of Oliver Cromwell impressed me as being unjust and overdrawn. In turning to Thomas Carlyle for a fairer view, the supernal garb in which he dressed the hero was found equally unsatisfactory." Mr. Church accordingly determined, very judiciously, to adopt a middle course. Between the Epicurean scepticism of Hume and the transcendental hero-worship of Carlyle it is not so difficult to sail as between Scylla and Charybdis, and Mr. Church's barque has safely made the passage. But we looked for a special essay on the life and character of Cromwell. Instead of this we have a general history, which, being much condensed, cannot be very lively or flowing. The spirit of the work is fair enough, but we do not see that new light is thrown on any picture of Cromwell's character or on any point of his often enigmatic career. Mr. Church occasionally quotes Mr. Gardiner in his notes, but he does not mention him in his preface, and he does not seem to be aware that Mr. Gardiner had done the work. He tells us that he has formed a very complete library of Cromwellian literature. He would have done us a service by giving us a catalogue, with a critical estimate, as far as possible, of the value of the different authorities.

BOOKS OF THE WEEK.

Alma-Tadema, Laurence. The Wings of Icarus. Macmillan. $1.25.
Annals of the American Academy. Vol. IV. June, 1893—June, 1894. Philadelphia: American Academy of Political and Social Science.
Appleton, Robert. After the Manner of Men. Boston: Franklin Publishing Co. $1.
Atkinson, James. The Loves of Laili and Majnún. London: David Nutt.
Ayres, Alfred. Acting and Actors. Appletons.
Baldwin, C. S. The Inflections and Syntax of the Morte d'Arthur of Sir Thomas Malory. Boston: Ginn & Co.
Bangs, J. K. Three Weeks in Politics. Harpers. 50 cents.
Bertheroy, J. Le Mime Bathylle. Paris: Armand Colin & Cie.
Bishop, W. H. A Pound of Cure: A Story of Monte Carlo. Scribners. $1.
Bormann, E. Das Shakespeare-Geheimniss. Leipzig: E. Bormann; New York: Westermann.
Brooks, Noah. Tales of the Maine Coast. Scribners.
Bourget, P. Steeple Chase. Paris: Lemerre; New York: Meyer Frères & Cie.
Cameron, Prof. A. G. Mérimée's Colomba. Henry Holt & Co. 60 cents.
Chambers, R. W. In the Quarter. Chicago: F. T. Neely.
Chaperoned. Cassell. 50 cents.
Chatard, Rev. F. S. Occasional Essays. Catholic Publication Society.
Classical Studies, in Honor of Henry Drisler. Macmillan. $4.
Colmore, G. A Daughter of Music. Appletons.
Conder, Major C. R. Judas Maccabæus and the Jewish War of Independence. New ed. Macmillan. $1.25.
Davis, R. H. Van Bibber and Others. Harpers. 60 cents.
Dodd, Anna B. Struthers, and the Comedy of the Masked Musicians. Lovell, Coryell & Co.
Dornis, Jean. La Voie Douloureuse. Paris: Lévy; New York: Charles Eitel.
Emmons, S. F. Geological Guide-Book for an Excursion to the Rocky Mountains. John Wiley & Sons.
En Pique-Nique, 1894. Publication Annuelle du Comité de la Société des Gens de Lettres. Paris: Colin & Cie.
Firth, C. H. The Memoirs of Edmund Ludlow. 2 vols. Oxford: Clarendon Press: New York: Macmillan.
Frye, A. E. Primary Geography. Boston: Ginn & Co. 75 cents.
Greenidge, A. H. J. Infamia: Its Place in Roman Public and Private Law. Oxford: Clarendon Press; New York: Macmillan.
Harlow, W. B. Columbia Redeemed from Slavery: Poetry. Buffalo: Charles Wells Moulton.
Hastings, George. A Tale of the Town. M. J. Ivers & Co. 25 cents.
Hill, W. K. William Henry Widgery, Schoolmaster. London: David Nutt.
Hoffman, Prof. F. S. The Sphere of the State. Putnams. $1.50.
Howells, W. D. Five o'Clock Tea. Harpers. 50 cents.
Jackson, J. The Theory and Practice of Handwriting. Revised ed. Wm. Beverley Harrison. $1.25.
Lafontaine, H. La Jolie Painepolaise. Paris: Lévy; New York: Charles Eitel.
Larned, J. N. History for Ready Reference. Vol. II.—El Dorado to Greaves. Springfield: C. A. Nichols Co.
Le Gallienne, R. Prose Fancies. Putnams. $1.
Le Mariage de Chiffon. 14th ed. Paris: Lévy; New York: Charles Eitel.
Lombard, L. Observations of a Traveller. Utica, N. Y.: The Author. 50 cents.
Maspero, G. Histoire Ancienne des Peuples d'Orient. Tome I. Paris: Hachette; New York: Dyrsen & Pfeiffer.
Maxwell, W. H. First Book in English. American Book Co. 40 cents.
Maxwell, W. H. Introductory Lessons in English Grammar. American Book Co. 40 cents.
Memoirs of the International Congress of Anthropology. Chicago: Schulte Publishing Co.
Miller, Olive T. Our Home Pets: How to keep them well and happy. Harpers. $1.25.
Moore, George. Esther Waters. Chicago: C. H. Sergel Co. 50 cents.
Moore, G. Esther Waters. M. J. Ivers & Co. 25 cents.
Myer, Isaac. Scarabs: History, Manufacture and Religious Symbolism. Edwin W. Dayton.
Naville, Prof. E. La Définition de la Philosophie. Geneva; Georg & Cie.: New York: Brentanos. $1.50.
Newton, Rev. W. W. A Run through Russia: The Story of a Visit to Count Tolstoi. Hartford: Student Publishing Co. $1.
Our Wonderful Bodies and How to Take Care of Them. First Book, 30c. Second Book, 50c. Maynard, Merrill & Co.
Peard, Frances M. An Interloper: A Novel. Harpers.
Pennypacker, S. W. Hendrick Pannebecker, Surveyor of Lands for the Penns, 1674—1754. Philadelphia: Privately printed.
Perry, Prof. A. L. Origins in Williamstown. Scribners.
Posse, Baron Nils. The Special Kinesiology of Educational Gymnastics. 3d ed. Boston: Lee & Shepard. $3.
Prévost, M. Les Demi-Vierges. Paris: Lemerre: New York: Meyer Frères & Cie.
Proceedings of the International Congress of Education at Chicago, 1893. National Educational Association of the U. S.
Putnam-Jacobi, Dr. Mary. Common Sense applied to Woman Suffrage. Putnams. $1.
Ramsey, M. M. A Text-Book of Modern Spanish. Henry Holt & Co. $1.80.
Ramsay, Prof. G. G. Latin Prose Versions, contributed by Various Scholars. Oxford: Clarendon Press; New York: Macmillan.
Richardson, F. B. Six Months' Preparation for Reading Cæsar. 2d ed. Henry Holt & Co. 90 cents.
Rothwell, R. P. The Mineral Industry: Its Statistics, Technology and Trade. Vol. II., 1893. Scientific Publishing Co. $5.
Ruskin, J. Verona, and Other Lectures. Macmillan. $2.50.
Russell, W. Clark. The Romance of a Transport. Cassell. $1.
Rutgers, L. On and Off the Saddle. Putnams.
Salomons, Sir David. Electric Light Installations. Vol II. Apparatus. 7th ed. London: Whittaker; New York: D. Van Nostrand Co. $2.25.
Savage, R. H. The Princess of Alaska. Chicago: F. T. Neely. 50 cents.
Selections from the Poems of Arthur Hugh Clough. Macmillan. $1.
Shakespeare's Comedy of Errors. [The Temple Shakspere.] London: J. M. Dent & Co.; New York: Macmillan. 45 cents.
Shakespeare's Measure for Measure. [The Temple Shakspere.] London: J. M. Dent & Co.; New York: Macmillan. 45 cents.
Simcox, E. J. Primitive Civilizations: Outlines of the History of Ownership in Archaic Communities. 2 vols. Macmillan. $10.
Stevens, B. F. Christopher Columbus: His Own Book of Privileges, 1502. London: B. F. Stevens; New York: Dodd, Mead & Co.
Stevens, Dr. A. H. Cure by Polarized Electricity. Philadelphia: The Author.
Stevens's Facsimiles of MS. in European Archives relating to America, 1773-1783. Vol. XXI. London: B. F. Stevens.
Stuart, Ruth McE. Carlotta's Intended, and Other Tales. Harpers. $1.50.
The Hon. Stanbury, and Others. Putnams. 50 cents.
The Major in Washington City. Second series. Chicago: F. T. Neely.
The Red House. Rand, McNally & Co.
Tompkins, A. The Philosophy of Teaching. Boston: Ginn & Co.
Thompson, Annie. A Moral Dilemma. Longmans, Green & Co. 50 cents.

Thurston, Prof. R. H. The Animal as a Machine and a Prime Motor. John Wiley & Sons. $1.
Valdés, A. P. The Grandee: A Novel. London: William Heinemann.
Venn, Mrs. The Husband of One Wife. Harpers. 60 cents.
Wallace, E. R. Descriptive Guide to the Adirondacks. Revised ed. Syracuse, N. Y.: E. R. Wallace. $3.50.
Way, Arthur S. The Tragedies of Euripides, in English Verse. Vol. I. Macmillan. $2.
Weed, C. M. Fungi and Fungicides: A Practical Manual. Orange Judd Co. $1.
Wells, A. R. Business: A Plain Talk with Men and Women Who Work. Fleming H. Revell Co. 35 cents.
Wolf, Emma. A Prodigal in Love. Harpers.

# The Nation.

NEW YORK, THURSDAY, JULY 12, 1894.

## The Week.

PRESIDENT CLEVELAND'S proclamations are the voice of the nation declaring that the law must be maintained, and that all persons who set themselves against it will be swept out of the way, and out of existence if need be. It is probably useless to expect that the proclamations will keep all idlers out of danger, but those who put themselves in the line of fire hereafter will do so at their own peril.

---

President Cleveland's method of dealing with Gov. Altgeld is a model one. He wastes no time in arguing with him, or in defending himself against his attacks, but in a few terse sentences sets him before the country in his true light as the friend and champion of disorder. Altgeld is probably as unconscious of his own bad manners as he is of the bad odor of his own principles; but boorish, impudent, and ignorant as he is, he can scarcely fail to wince under the treatment which he receives from the President. He is probably unable to comprehend that what gives the President's words their crushing weight is the fact that American public opinion is in a solid mass behind them. The President is speaking for the American people and for the preservation of their Government, and his words are suitable to the case. Altgeld's tirades are serving the useful purpose of showing to the people, not only of Illinois, but of all other States, the folly of putting the administration of public affairs into the hands of professional blatherskites, who are either too ignorant or too unprincipled to conduct themselves in accordance with the spirit of American institutions.

---

A disheartening aspect of this troublous time is the cowardice of Congressmen at Washington. A few Senators have spoken out like men, but it has been impossible to get a positive expression of opinion from any Representative of standing. While the respectable press of the country is a unit in applauding and sustaining the President, and while the great mass of the people are delighted and relieved at his firm attitude, Congress sits by shamefaced and cowering. The only resolutions introduced are the firebrands of Populists, and it is only the rule requiring their reference to a committee which saves us from incendiary speeches by our lawmakers. If Congress had any men left in it it would have passed before this a joint resolution holding up the hands of the President and rebuking and warning anarchists. But the anarchists have votes, and the most valiant Congressman, who remembers that election day is only four months off, runs away from the interviewer in a fright. This is not only contemptible but senseless. It takes a purblind demagogue, in the Washington haze which always distorts popular opinion, to think for a moment that there is a vote to be gained by anybody in crawling before the anarchists. Everybody with the cobwebs out of his eyes sees that the men who are not afraid, like Senator Davis and the President himself, are the men whom this nation delights to honor, and that there never was so much public contempt for the trimmer who haws and hums and dodges when a national crisis comes.

---

The dearth of convictions and courage among our public men has enabled Senator Davis of Minnesota to reach fame and popular approval at a bound. He has simply done his duty and told the truth; but it is so long since anybody at Washington has had, or dared to avow, a clean-cut belief on any important subject, that his action takes on almost an heroic quality. Especially is it so long since any one holding an elective office in this country has ventured to resent the orders of a demagogue labor leader with votes behind him, that Mr. Davis's dash of cold water into the face of that portentous person, "President of 209 A. R. U.," is as grateful a surprise as a northwest breeze with the mercury at 92. It is a pleasure to reprint his direct and pungent words:

> "I have received your telegram. I will not support Senator Kyle's resolution. It is against your own real welfare. It is also a blow at the security, peace, and rights of millions of people who never harmed you or your associates. My duty to the Constitution and the laws forbids me to sustain a resolution to legalize lawlessness. The same duty rests upon yourself and your associates. The power to regulate commerce among the several States is vested by the Constitution in Congress. Your associates have usurped that power by force at Hammond and other places and have destroyed commerce between the States in these particular instances. You are rapidly approaching the overt act of levying war against the United States, and you will find the definition of that act in the Constitution. I trust that wiser thoughts will regain control. You might as well ask me to vote to dissolve this government."

Out of a Senate where Republican Sherman and Democratic Call are vying with Populist Kyle in kneeling to rioters and beclouding the issue, such language comes with double effect. It not only shuts the mouth of the man to whom it was addressed, but it is a standing rebuke to the supine or truckling colleagues of the man who was not afraid to speak. We could hope that it marks the beginning of a new era, or, rather, a return to an old one, when Senators shall again have positive opinions and again have the courage to declare them.

---

A noteworthy feature of the situation is the hearty support which the federal executive receives from that part of the country where the State-rights theory was once carried to absurd lengths. The *Herald* has been interviewing the Governors of many States, and the most significant deliverance is the one from Gov. Stone of Mississippi:

> "This is a species of lawlessness that should and must be suppressed. I heartily approve the President's proclamation, and believe federal troops should be used to protect the lives and property of citizens of the United States in every instance where it is necessary."

That the Governor represents public sentiment in that latitude is shown by the declaration of the Vicksburg *Commercial Herald* that "the South will be solid for law and order and the national government." When the Governor and the people of Jefferson Davis's old State thus sustain the President of the Union, it is made clear that the spirit of nationality has taken possession of the whole country.

---

It is an interesting circumstance that one of the federal officials who have come into collision with one of the mob governors is an ex-Confederate. Gen. "Jo" Shelby, who won his title by fighting to overthrow the federal government thirty years ago, is now United States marshal for the Missouri district. In that capacity he despatched a posse of deputies to the place where a lot of Debsites had seized a mail train, to release the train and preserve the peace. Gov. Stone, who seems ambitious of enrolling himself with Altgeld, Lewelling, Pennoyer, and Waite, immediately sent a protest against the marshal's action as a bit of impertinence and an unwarranted interference with the authority of the State of Missouri. Gen. Shelby promptly replied that he was acting for and under the instructions of the United States Government, and he informed the Governor that if he desired any additional particulars, he should make application to the attorney-general at Washington; meanwhile he (Shelby) would continue to do his duty under the laws. The Governor concluded to content himself with "criticising" the attitude of the federal authorities.

---

"It is the unexpected that happens." Looking back ten or fifteen years, we behold an enterprise started in the vicinity of Chicago peculiarly in the interest of working men. It was not a charitable institution—quite the contrary. If it had been such it would have failed from the start, since it

appealed specially to independent, intelligent, self-respecting men—men who scorn to accept anything that they have not earned. It was Mr. Pullman's aim to offer to this class of men superior accommodations and more of the comforts of life than they could obtain elsewhere for the same amount of expenditure, but to do this in a scientific and business-like manner, so that the investment should pay its own way and every tub stand on its own bottom. Gratitude was not looked for. In fact, it was not called for under the circumstances, but it was expected that the men drawn together by the superior civilization of the town of Pullman would be of too high an order of intelligence to insist, for example, that the company should build cars at less than actual cost, when the new dollars taken in would not replace the old ones paid out, or to refuse to examine the company's books to determine the facts of the case. Of all the things that might be expected to happen, this was the last. If the Pullman shops had simply been closed, as those at Detroit were, nothing would have ensued. There would have been no strike, as there was none at Detroit. But because the Detroit shops were closed in order that the Pullman shops might run a little longer at some rate of wages, the men at Pullman struck, and then the followers of Debs struck all the way to California. Nothing more unexpected could have happened.

---

It is an astonishing revelation that Debs, the manager of the strike, was under treatment for dipsomania two years ago, and that it is a question whether he is at present entirely sane. The physician who treated him then says he was suffering from alcoholism in its worst form, and was a physical and mental wreck. He says that he telegraphed to Debs a few days ago imploring him to stop, as the condition of his nervous system made him irresponsible for his own orders. That a man of this physical and mental condition should be able to paralyze great railway systems, and throw several States into such a condition of anarchy that the President of the United States has to concentrate the regular army at the centre of disturbance, and issue proclamations for the suppression of rioting, is certainly the most extraordinary development of the labor problem that the world has yet seen. It puts this country before the world as the sport of lunatics and madmen, and shows us what we shall come to if we continue to allow State governorships to be filled with Altgelds, Lewellings, Pennoyers, Waites, Stones, and McConnells. Popular institutions cannot long stand the strain of such bouffe government as these creatures give us.

One element in bringing Debs and his American Railway Union to their present dictatorial attitude is not clearly understood at the East. It will be remembered that a strike occurred on the Great Northern Railroad a few weeks ago, and was amicably settled through the efforts of a committee of St. Paul and Minneapolis business men. An incident which followed this settlement did not attract the attention which it deserved. The president of the railroad held that it was not bound to reinstate in its employ men who were found guilty of any criminal offence against the United States, who had maliciously injured the company's property, or who had placed the lives of passengers or the property of the company in danger by abandoning trains. The question was submitted to the arbitrators, who decided that the agreement bound the road to reinstate and pay men then under arrest and awaiting trial on the charge of malicious destruction of property, men who had interfered with the running of trains, and men who had abandoned trains in inacessible places. This was the same thing as saying that the railroad could exert no discipline over its employees, and it was entirely natural that Debs should think himself warranted in ordering railroads not to run Pullman cars when a committee of business men in St. Paul and Minneapolis had given such encouragement to the notion that employees might manage the property as they chose.

---

California has been going through a long training in theoretical anarchism—so long and so thorough that the Portland *Oregonian* considers anarchism one of the planks of the Republican platform in that State. Now practical anarchism has come. The State is in the hands of mobs at Oakland, Sacramento, and Los Angeles, and when the militia are called out to enforce the law, they side with the rioters and throw down their arms. Logically they ought to do so because, if the mobs are simply seeking to enforce their rights, as the newspapers of San Francisco imply, why should the militia become the instruments of tyranny to fasten the chains of a Pullman despotism on them? We can see no way to improve the education of the Slopers but to leave them in the hands of their pets and favorites. Probably a month will suffice to put courage into the breasts of the decent people, who outnumber the Sand-lotters and other anarchists by five to one, and nerve them to fight for *their* rights. Something of this kind occurred at Portland, Oregon, a few years ago when that city was under the domination of an anti-Chinese mob. The decent people were at last driven to the necessity of arming themselves and organizing to enforce the law. They did so, and within twenty-four hours the mob had dispersed. Not a shot was fired. California needs a similar demonstration.

---

The overthrow of Populism in Kansas seems assured by the decision of the Democrats to run a "straight" ticket this year. In 1892 they "fused" with the Populists, and the two parties polled 163,507 votes for Lewelling, as against 158,075 for the Republican candidate. The fusion policy was opposed at that time by some of the wisest leaders among the Democrats, but the argument that such a combination might take the electoral votes of the State from Harrison prevailed with the mass of the party. Now, however, Democrats are as much disgusted as Republicans with the record of the Populist State administration; and with their vote generally cast for their own ticket, Lewelling can stand no chance of reëlection.

---

Prof. George Herron of Iowa College, whose anarchistic teachings were so properly rebuked by the Governor of Nebraska at the commencement of the University in the latter State a few weeks ago, has been holding, with B. Fay Mills, the evangelist, the Rev. Thomas C. Hall of Chicago, and other congenial spirits, what is described as "a sociological love feast" at Grinnell, the seat of the college. Its character may be inferred from the fact that one of the speakers made a plea for greater leniency for anarchists: "He would convict them and send them out in the world with a sort of legal blessing and a theological admonition to go and sin no more." The Iowa newspapers naturally and justly denounce such teachings as abominable and dangerous. The Sioux City *Journal*, by the way, notes that although these sociologists demand the abolishment of rent and interest as now understood, "Prof. Herron still enjoys the interest of his $35,000 endowment, and Brother Hall lately left a $4,000 place for an $8,000 one, and Mr. Mills is, with the single exception of Mr. Moody, probably the best-paid evangelist in the world."

---

Everybody sighed with relief on hearing that the Senate had at last actually voted on the tariff; but both the Senate and the bill are much the worse for having kept company for five months. The Senate has made a new record for itself in the way of stupid incapacity, and this time with a suspicion of personal corruption freely thrown in, while the bill enjoys to the full the Scriptural blessing of being ill spoken of by all men. This is largely, to be sure, a matter of comparison and of wasted opportunity. The bill as it stands would have been considered by tariff reformers a few years ago as almost too good to be possible. It provides for

free wool and free lumber, and cuts many of the worst McKinley duties in two. But in comparison with what the Senate might easily have done, even in comparison with what the House did, the outcome is so poor, so scarred by personal intrigue and surrender of principle and decency, that its bad features justly hold the first place in the public estimation. It now rests with the House to save for the Democratic party even the appearance of consistency and honesty.

---

The question how long a time need elapse before the final enactment of the measure into law is now of general interest. Some idea of the period necessary may perhaps be derived from the history of the McKinley bill in its later stages. It was on the 10th of September, 1890, that the bill passed the Senate, having passed the House on the 21st of the previous May. Having lain one day on the Speaker's table, it was referred to the ways and means committee September 12. On the 15th, Mr. McKinley reported it back from that committee with a recommendation for non-concurrence in the Senate amendments, and it went to the committee of the whole. Consideration of the Senate amendments was limited to one day, so that the bill was reported to the House and a conference with the Senate ordered September 16. The work of the conference committee occupied ten days, and the result was reported on September 26 to the House, which next day agreed to the changes recommended and took a final vote on the passage of the bill. The bill as agreed to by the conference committee was reported to the Senate September 29 and passed by that body the next day. Three weeks, therefore, covered the period of conferences, compromises, and final details. A week more may now be allowed, and the work be completed by about the 1st of August.

---

Chairman Wilson's speech on Saturday, in moving to non-concur in the Senate amendments to the tariff bill, was quiet and dignified in tone, but indicated with unmistakable clearness his intention to stand firmly for the main features of the House bill. What these are he left it not at all uncertain. They are free raw materials and ad-valorem taxes. Many of the Senate's swarm of amendments are, as Mr. Wilson admitted, unimportant; but those which take raw materials off the free list and which slip in tricky specific duties at so many points to befog the taxpayer and benefit the manufacturer, are a betrayal of party and a surrender of principle. Chairman Wilson was well within the truth in saying that the bill as it passed the House was more conservative than the sentiment of the party and the country warranted and demanded. To give up any essential part of that now would be to lose, and to deserve to lose, what little respect the party has left it. The House conferees cannot be too exigent and unyielding in their demands on the Senate. They ought to keep constantly in mind that what they have to fight is really a small clique of distrusted and discredited Democratic Senators. The majority of the Senate saw fit to give in to this band of "strikers," but it is to be hoped that the House will hold a higher tone with the Gormanites. They will surrender at discretion if met in open warfare.

---

Ex-Speaker Reed can scarcely expect the public to take his grief seriously at not being invited in by the Democratic conferees on the tariff. No one is so responsible as he for the doctrine that it is a stupid and needless formality for the majority to concede anything to the minority except the right to protest and vote against the decision of the majority. There is no doubt that the pretence of a different practice before Reed's speakership was mostly a polite fiction. But it was polite, and might have lasted to this day had not he, with brutal frankness, disowned and spurned the whole thing. The Democrats are only giving him a dose of the medicine which he himself concocted, made a little more bitter, of course, as time and their own ingenuity have taught them how to do so; and there is no occasion for his wry faces over it. In fact, any one looking closely will see that his wry face is really only his customary sardonic and cynical wink.

---

The signs multiply that the struggle between the Senate and the House of Representatives will turn upon the sugar duty. If the report of the *World's* correspondent is to be trusted, the number of Representatives who are willing to declare in advance that they will resist the Senate's amendments is no less than 200 out of the 253 who responded to the inquiry. It is to be observed, however, that nearly all the members of the ways and means committee refuse to commit themselves, and that many of those who reject the Senate's amendments indicate some willingness to accept modifications of the schedule as it passed the House. It is also to be observed that of those who refuse to commit themselves, 41 are Democrats, while the opponents of the Senate's schedule include 78 Republicans and 7 Populists. Moreover, if the replies of the respective members are read in detail, a general disposition is apparent to accept the recommendations of the conference committee. It seems probable, therefore, that whatever is agreed upon in conference will be accepted by the House of Representatives.

The comparative statement of the receipts and expenditures of the United States Government for the fiscal years ending with the month of June, 1893 and 1894, has been issued with great promptness by the Treasury Department. It shows an excess of expenditures over receipts for the year just ended of close upon $70,000,000. It should be borne in mind that during the previous year the balance in favor of the Government was but little over $2,000,000, so that the financial position was precarious even before the hard times began to be felt. The actual diminution of revenue was about $89,000,000, the decrease of expenditures being only between $17,000,000 and $18,000,000. Nearly the whole of the loss of revenue was due to the shrinkage in customs receipts, which amounted to about $71,000,000, or more than the deficit. The loss of internal revenue was only about $14,000,000, and during June revenue of this kind was materially greater than during the corresponding month of 1893. On the side of economy there is almost nothing to show except the saving in pensions, which amounts to over $18,000,000. The coming year should show a very marked decrease of expenditure in several directions, so that, even if business did not improve, the deficit would be far smaller.

---

But the decrease in customs receipts is to a great extent due, not to business depression, but to anticipated tariff changes. It would not be unreasonable to consider that part of the shrinkage in customs receipts due to the panic as the same percentage of the whole as the entire shrinkage in internal-revenue receipts. That is, the falling off of internal revenue being about 10 per cent., the falling off in customs receipts, had no reduction of duties been anticipated, would have been the same, or about $20,000,000, instead of $71,000,000. This loss of revenue was partly inevitable, since in hardly any condition of business would importations go on to any extent in the face of an impending reduction of duties. But it is principally due to the procrastination of Congress. For nearly two years it has been known that duties were to be reduced; and for all that time importers have been obliged to do business from hand to mouth. Had Congress acted promptly, it is very doubtful if the present year would have closed with any deficit at all. This is one of the incidental expenses of state action which the socialists fail to consider, but which make even existing governments a serious burden to industry. Should the tariff bill be passed with the proposed duty upon sugar and with the tax upon incomes, it is highly probable that the close of the present fiscal year will see the Government encumbered, not with a deficit, but with a surplus.

*THE NATION AND THE NEW SLAVERY.*

THE assertion of the national authority during the past week to repress disorder and lawlessness which were fast becoming a national peril, has many analogies with its assertion in 1861. Now, as then, an evil which has been long tolerated or impatiently endured, and left to local authorities to dispose of as they saw fit, has at last become so defiant and menacing, so evidently destructive of all law and government, that the instinct of self-preservation is aroused to grapple with it. There can be but one supreme power in this country. It is either the nation or a band of boycotters, just as, in 1861, it was the nation or a band of slaveholders. When that issue becomes clear and sharp, it is time for the Government to summon its last man and spend its last dollar in a fight for its own life, or else commit suicide in despair.

The boycott's blow at the life of the nation has not been struck with such dramatic effect as slavery's blow, but it is just as deadly in its aim. The contention that the entire industry of the land can be wielded as a club to compel any man or corporation to surrender a single right or a single dollar, means the setting up of a new government All the raging of all the demagogues cannot obscure that. If an individual employer has been unjust or a corporation tyrannous, that is an evil for which its own and legal remedy must be sought. To take the whole country by the throat, to defy municipal and State officers, is simply the levying of public war to redress a private grievance. It has taken the nation a long time to wake up to this, but it has waked up at last, and the determination of the Washington authorities to use every rifle under their control before giving up the attempt to enforce the laws is as truly patriotic a resolution, and as truly essential to the continued life of the Government, as was the call of Lincoln for volunteers when Sumter fell.

The insidious attack of labor-unions on the power of the Government, with the boycott and a universal sympathetic strike as weapons, also has its instructive analogies with the assault of slavery upon the national life. This reckless and militant trades-unionism deserves, in fact, to be called the slavery of our day. It holds men in a bondage as absolute and humiliating as any system of slavery ever known. Their judgment and rights are, for the autocrat who gives them their orders, non-existent. Some of them beg him to be allowed to go back to work, to earn bread for their wives and children, but he lashes them back into idleness and hunger with the true insolence of a slave-driver. The cruelty of this new slavery is likewise characteristic. Its dupes it wantonly leaves to suffering, and against its victims it rages with the heartlessness of a savage. While crying to heaven against the oppression of employers, it subjects delicate women and helpless and innocent children to discomforts and dangers in a way to bring a blush to the cheek of a Zulu.

For many years this evil has been strengthening itself and growing more offensive and threatening, and for years, just as in the case of slavery, it has had its advocates, its apologists; many have been alarmed at its growth, some have foreseen the disasters wrapped up in it, but nearly all have acquiesced in the view that it would have to be dealt with by local authorities. But now what has all along been latent in the new slavery has become evident to all. It stands unmasked as an avowed contestant for national supremacy, and the swift return stroke from the national authority marks the consciousness, on both sides, of the true nature of the struggle. All this is fairly comparable to that other attack on the Government which it took four years of bloody war to crush.

The course of events during the past fortnight explains how writers like Mulford and Green could speak of the organic life of the nation as something distinct from its institutions. There does seem to be something like a vital process in the way the nation becomes conscious of a peril to its life and rouses itself to meet it. It is not simply that the great strike and boycott are attended with violence. As we write, the disorder has not been nearly so great as that evoked by the coal strike a few weeks ago. Nor is it alone the fact that there is a national humiliation in such disregard of law. There was a deep national humiliation in the New Orleans massacre of Italians and in the slaughter of Chinese in Oregon. But none of these occurrences stung the Government into an assertion of its authority conterminous with the territory and the property and lives under its jurisdiction. That it has now made it is because it sees that an *imperium in imperio*, or rather *imperium contra imperium*, such as the boycotters are trying to set up, means its own dissolution.

*GOV. ALTGELD AND THE PRESIDENT.*

IT should surprise nobody that Governor Altgeld of Illinois came to the rescue of Debs and his fellow law-breakers by protesting against the efforts of the federal authorities to restore order in Chicago. He is the executive who pardoned the anarchists out of prison, and it is only natural that he should sympathize with anarchists who have not yet been sent to prison.

The long despatch which Altgeld sent the President is chiefly devoted to a defence of the strikers, and an exposition of their attitude as defined by Debs. His misrepresentation of the facts is so obvious and clear that it needs no attention. The only argument advanced by the Governor which deserves any examination is his plea that the President is disregarding local self-government in sending federal troops without being requested so to do by the executive of the State. Upon this point he says:

> "I submit that local self-government is a fundamental principle of our Constitution. Each community shall govern itself so long as it can and is ready and able to enforce the law; and it is in harmony with this fundamental principle that the statute authorizing the President to send troops into States must be construed. Especially is this so in matters relating to the exercise of police power and the preservation of law and order.
>
> "The question of federal supremacy is in no way involved. No one disputes it for a moment; but under our Constitution federal supremacy and local self-government must go hand in hand, and to ignore the latter is to do violence to the Constitution."

The President's reply is brief, but comprehensive. It meets the Governor's arguments, and covers the whole ground in two sentences, as follows:

> "Federal troops were sent to Chicago in strict accordance with the Constitution and laws of the United States, upon the demand of the Post-office Department that obstruction of the mails should be removed, and upon the representations of the judicial officers of the United States that process of the federal courts could not be executed through the ordinary means, and upon abundant proof that conspiracies existed against commerce between the States. To meet these conditions, which are clearly within the province of federal authority, the presence of federal troops in the city of Chicago was deemed not only proper but necessary, and there has been no intention of thereby interfering with the plain duty of the local authorities to preserve the peace of the city."

The authority under which the President acts is derived from section 5298 of the Revised Statutes, enacted July 29, 1891, and section 5299, which became a law April 20, 1871. The former provides that "whenever, by reason of unlawful obstructions, combinations, or assemblages of persons, or rebellion against the authority of the Government of the United States, it shall become impracticable, *in the judgment of the President*, to enforce, by the ordinary course of judicial proceedings, the laws of the United States within any State or Territory, it shall be lawful for the President to call forth the militia of any or all the States, and *to employ such parts of the land and naval forces of the United States as he may deem necessary* to enforce the faithful execution of the laws of the United States, or to suppress such rebellion, in whatever State or Territory thereof the laws of the United States may be forcibly opposed, or the execution thereof forcibly obstructed." Section 5299 is as follows:

> "Whenever insurrection, domestic violence, unlawful combinations, or conspiracies in any State so obstructs or hinders the execution of the laws thereof, and of the United States, as to deprive any portion or class of the people of such State of any of the rights, privileges, or immunities, or protection, named in the Constitution and secured by the laws for the protection of such rights, privileges, or immunities, and *the constituted authorities of such State are unable to protect, or, from any cause, fail in or refuse protection of the people in such rights*, such facts shall be deemed a denial by such State of the equal protection of the laws to which they are entitled under the Constitution of the United States; and in all such cases, or when-

ever any such insurrection, violence, unlawful combination, or conspiracy, opposes or obstructs the laws of the United States, or the due execution thereof, or impedes or obstructs the due course of justice under the same, *it shall be lawful for the President, and it shall be his duty, to take such measures, by the employment of the militia or the land and naval forces of the United States, or of either, or by other means, as he may deem necessary, for the suppression of such insurrection, domestic violence, or combinations.*"

There is no room left for discussion of the President's authority and obligation to do just what he is doing. It will be seen that the discretion of the chief executive is absolute. Everything is left to his judgment, and he has the support of the laws in taking any measures which he may deem necessary. Section 5299 of the revised statutes was fortunately framed so as to meet a contingency which could hardly have been foreseen—the occupation of the governorship by a man who sympathized with law-breakers and who would not use the power of the State against them. But for such a grant of power, a Populist or anarchist Governor—like Altgeld of Illinois, Lewelling of Kansas, Waite of Colorado, or Pennoyer of Oregon—might allow government to be overthrown in his State, and lawlessness to run riot, and still claim that there was no warrant for federal interference. Happily the President is armed by statute with all the power needed not only to suppress mobs, but to overcome anarchist Governors.

## *THE SITUATION IN CALIFORNIA.*

THE popular animosity to the railroads and the sympathy with the strikers that are manifested by almost all classes in California, as shown by the press despatches, are perplexing to Eastern readers. There does not seem to be a voice raised there in favor of order and civil government; and the inconvenience and losses to which the public are subjected seem to be accepted willingly, so long as the railroads suffer quite as much or more. There are several causes for this.

To begin with, California transportation is practically monopolized by one company, the Southern Pacific. This road controls the entrance to San Francisco northward from Los Angeles; it leases the Central Pacific, and so controls the direct traffic East as far as Ogden, and it controls the line running north to Oregon. Besides this, it controls the ferries across San Francisco Bay, most of the California local lines of railroad, and most of the San Francisco street-car lines. Every complaint, therefore, that is made against a railroad there—quality of service, rates of fare, and freight charges—falls on this company. There is no chance to compare it with the service and charges of other companies in the same territory, and it centres in itself all the popular animosity to "monopolies." This animosity is especially strong in California because the profits of land products depend there almost entirely on freight rates. Grain is shipped by water, but the fruit industry, on which the majority of California ranchers depend for a living, is a success or a failure in accordance with the grower's ability to get his fruit quickly to an Eastern market at rates that will leave him a profit. The universal complaint there is that the Southern Pacific company adjusts its freight charges so that the profits of fruit-raising go largely into its treasury. On the other hand, it is pointed out that the distance of California from a profitable market must always be an obstacle to its success as a fruit-growing State, in view of the competition of Florida and countries reached by water; that fruit-growing there has been overdone, as grape-raising undoubtedly has been (fine vineyards have been dug up in recent years as wholly unprofitable), and that a railroad has to charge more for carrying perishable freight than it does for carrying freight that can take its chances on the line and requires no attention.

California suffers from another "monopoly" that has a great deal to do with the formation of public opinion; that is, a lop-sided press. It is no exaggeration to say that there is scarcely a newspaper in the State that discusses public affairs with any degree of independence. Journalism there means truckling to party and to the mob element. It was so when Chinese rights were concerned, it was so when the Coxey movement was under way, and it is so now when the mob is paralyzing the business of the State. During the anti-Chinese excitement, editors whose papers were loudest in advocating the expulsion of the Chinese were ready to admit privately the falsity of their position. But the public were on the other side, and fear of loss of circulation or of advertising patronage dictated their course. Any visitor to California will hear intelligent Californians lament the weakness of the local press.

California, too, is politician-ridden. "Practical politics" controls its affairs, at great cost to the people. There is boodle in every public enterprise. Some of the persons appointed to assist in getting up the California exhibit at Chicago resigned because, even in such a matter, the bosses insisted that they should have a share, and it is said that some of the county exhibits in the San Francisco exhibition cost thousands of dollars more than they needed to on this account. As a result, the State Legislature is corrupt. It is openly charged with being out of real sympathy with the farmers. A railroad magnate, Stanford, had a life hold on the United States Senatorship. A quiet movement is in progress all over the State to place the State affairs in different hands.

Such is the situation there as it stands to-day. Separated by a vast distance from the Eastern States, and by a territory, too, that is for a great width not adapted to thick settlement, California has problems of its own to solve. Its State pride is intense, and, because of its seclusion and its vast area, county rivalry takes the place of State rivalry in the East. Its mines have become secondary in importance to its ranches, and in regard to these there are trying problems to be solved. Its capacity of production is undisputed. It is now trying to find out what it can produce at a profit. It may be the wine-producing country of the future. Its olives may supply the markets of the world. Its dried and canned fruits may be the source of permanent prosperity to its fruit-growers. But its population will have to learn the old lesson that no prosperity comes to a people who ignore law and order, and that economic wrongs are not righted at the hands of mobs, whether those mobs direct their energies against defenceless foreigners or temporarily defenceless corporations.

## *THE SETTLEMENT OF LABOR TROUBLES.*

AFTER sitting for over three years, the Royal Commission on Labor has submitted its final report. It had made a number of reports already, and has from the beginning poured forth a stream of documents of diverse character, so that it would require the leisure of a Methuselah to master the whole of its publications. The upshot of it all is, in the words of the London *Economist*, "a majority report which is more or less inconclusive, and a minority report which is little but the manifesto of a party." While the conclusions and recommendations submitted are not absolutely valueless, hardly any one will contend that they are worth the enormous amount of time and money which they have cost. The results are what could have been obtained at the outset in a week by getting the opinions of a dozen clear-headed men. In fact, the method of investigation pursued by this commission and by most commissions of this kind violates every principle recognized by science, and the results have the same relation to political economy that a collection of the files of all the newspapers published would have to history.

There are, however, some supplementary "Observations," drawn up by the Duke of Devonshire and signed by several of the commissioners, which are not without bearing upon our own troubles. As is well known, the English law was only recently amended so as to recognize the existence of unions of laborers in any way except as conspiracies; but the amendment did not go so far as to authorize the courts to enforce certain agreements which the trade-unions might advantageously make. The result is, that these bodies have been unable to enter into any legally enforce-

able contracts as bodies with each other, or with outside persons, except with regard to the management of their own funds and of real estate; and it appears that the same disabilities rest upon the trade associations of employers. In view of the fact, disclosed by the evidence given before the commission, that a considerable and very important part of British industry is conducted under collective agreements made in the most formal way between highly organized trade associations, and that the substitution of agreements between associations for agreements between individual employers and individual workmen is a growing practice, the commissioners hold that the law ought certainly to recognize the rights and obligations so created.

In the opinion of these commissioners such a change in the law would result in the better observance for definite periods of agreements with regard to wage-rates, hours of labor, apprenticeship rules, demarcation of work, profit-sharing, and joint-insurance schemes. But of still more consequence would be the better basis thus created for arbitration in industrial disputes. The absurdity of what is known as "compulsory arbitration" is well known. There is no means of compelling the parties to the arbitration to observe the judgment of the arbitrator. But if the trade-unions should be legally authorized to contract with employers, whether individuals or associations or corporations, the consequence would follow that they would be liable to be sued for damages, in case of breach of contract; which damages would be payable out of their collective funds. It may be added that, since questions of this kind would fall under the jurisdiction of all law courts, ordinary litigation would tend to take the place of arbitration in disputes between workmen and employers, as it does in most other controversies.

It is further recommended in these "Observations" that every contracting association should be responsible for carrying out the collective agreement by all its members, so long as they remain its members, and that every member of an association should, during membership, be held to be under a contract with the association for observance of this agreement. The effect of this would be to give to those entering into contracts with an association the right to sue it for damages in case of breach of contract by it, or by any of its members, and to give an association the right to recover damages from those of its members who infringed the collective agreement. It would be necessary to add to this a responsibility on the part of the association for the torts committed by its members, in cases of maltreatment or intimidation of free laborers, and also in cases where property was destroyed by its members during strikes. Such legislation as this would clearly establish a *modus vivendi*, and it would be practicable to maintain actions for damages without resorting to strikes or lockouts, for failure to submit questions to arbitration after agreement to do so, for failure to raise wages when promised, etc.; the controversy being settled in civilized fashion by the lawyers in court while the parties were going about their regular business.

To return to the subject of State intervention in trade disputes, the commissioners' observations are so judicious as to deserve quotation. They say:

"To examine this question it is desirable, in the first place, to point out what the State cannot do according to the ordinary principles accepted in this country. It seems to be obvious that the State cannot compel either individuals or bodies of men to enter into agreements, and that the state cannot compel employers to give employment or workmen to do work upon terms which they do not respectively accept. Inasmuch as strikes and lockouts are, in practice, the assertion of these essential liberties on the part of the employers and workmen, it is clear that the State cannot prohibit acts of this kind and compel the parties to resort to tribunals of any sort instead. It was suggested in the evidence that strikes and lockouts should be illegal and punishable in cases where arbitration had not first been resorted to. But it seems, for the reasons just given, that it is impossible to make strikes or lockouts illegal and punishable in any case, leaving out of consideration such exceptional cases as those of the army or navy, or certain cases especially provided for by legislation where a sudden strike in breach of contract may involve actual danger to the public. Generally speaking, it may be laid down that the State cannot compel parties to submit to arbitration matters upon which they have a perfect right to take their own line, and it cannot compel either employees or workmen to carry out, by way of specific performance, an award as to wages or other terms of service. For these reasons the Royal Commission on Trade Unions of 1867 appears to have decided rightly (while warmly advocating the extension of voluntary arbitrations) that no 'system of compulsory arbitration' is practicable."

It is evident that the scheme which is outlined above is rational and practicable. We are not disposed to maintain that the State should decline to enforce any contracts, not palpably against public policy, which individuals, or which associations of individuals, choose to make with one another. At the same time, in view of the narrow spirit which has always in the past characterized trade-unions, and which is as intense to-day as ever, we are inclined to regard any increase of their functions, except in the direction of mutual benefit and insurance, with some apprehension. The disposition manifested by these unions to exclude free workmen from the labor market might, if their strength were increased, lead to great oppression. Still, as their responsibility would increase with their strength, the rights of individual workmen might find sufficient protection under such a system as has been described, and it is perhaps the best solution available in England. In this country it is very evident that our pressing need is not for more law, but for the courageous enforcement of what already exists.

## ÎLE-DE-FRANCE AND PICARDY.—V.

LONDON, April, 1894.

COMPIÈGNE is a contrast to rude Coucy and grave Noyon—though far less than in the brilliant times when Napoleon III. passed his hunting seasons there. But it has a history, not feudal, communal, and episcopal like the other cities we had seen, but royal and even pontifical, for Innocent II., driven from Rome, established the Holy Seat there. Kings were chosen, crowned, poisoned, and buried, royal matches made, royal brides received, royal marriages celebrated there; queens divorced there and mistresses substituted for queens. There it was that Robert the Pious pardoned his assassins and St. Louis kissed the leper, that Jeanne d'Arc was captured and Richelieu appointed minister. The States-General have been held and treaties concluded there. But with all this history the two ancient churches and the Hôtel-de-ville are better worth seeing than the seat of the court, the château, a heavy edifice of the time of Louis XV.

The chief use of Compiègne to us was to serve as a base from which to move upon Pierrefonds. We drove through the Forêt de Compiègne, once sought for its wolves and boars, then for its stags, and now for the pictures it suggests to artists. Antiquarians find in it traces of the worship of the Druids and the stations of the Romans; at a later time, if we may believe Ariosto, the Knights of the Round Table held their meetings under the great trees. One should go by "la jolie route," which winds among the low hills well covered with oak and beech and hornbeam, catching near Pierrefonds distant views that recall New Hampshire or western Pennsylvania, noting here and there the touch of the woodman's axe or watching the rabbits scamper away from the track. Then one can return by the straight road and see the old women tottering under loads of brushwood twice as long as themselves, and looking indeed more like Birnam wood coming to Dunsinane than like human beings.

Pierrefonds, if it excites the imagination less than Coucy, instructs it more. Nowhere in the world is there such a reconstruction of the Middle Ages. Pierrefonds has been rebuilt exactly as it left the hands of the architect of Louis d'Orléans in 1390, and though the new decoration is of course not the same, it is conceived entirely in the spirit of the time by the most accomplished antiquarian architect that France has ever had. And yet one cannot regret that he never had at his disposal the fifty million francs that would have enabled him to restore Coucy with the same completeness. Let everything be done to preserve that from further dilapidation, but keep it as it is. One spick-and-span antique is enough in a small department.

At Pierrefonds, with a little time and a little reading, one could easily reconstitute the whole life of the château. The stage and the scenery are there; it needs but the actors and the costumes. And even the hurried tourist, if he will look well at the moats and ramparts, gates and drawbridges, sculptured columns, storied walls, carved chimneys, the great statue in the court, and the stone crocodiles crawling down the towers—look till he can close his eyes and yet see every detail—and then will call up his reminiscences of story and stage, of ballad and opera, will not find it difficult to fill the great halls with knights and ladies, the offices with servants, the guard-rooms and battlements with soldiers. One should not fail to see the fourteenth-century

church in the village—all there is to see, in fact. It is a most strange mixture of constructions of different epochs, with a very ancient crypt dug in part out of the rock.

At Clermont, though the fourteenth-century church is well worth a visit, we cared most for the market, whose opening was announced by a costumed official beating a drum about the streets, though at the close it simply melted away like the open-air markets in Paris. It was held on a slight declivity, paved with small flat-topped blocks of stone, beautifully clean, and surrounded by two-story stone houses, solid, respectable, clean, but dingy, among which stands prominent (on the corner of one of the four streets that start from the place) the town-hall, built in 1320, the oldest in the north of France. The night before, attracted by a light, I had listened to the town band practising there. No rustic band in a New England town ever played worse. The place was now filled with a hundred old peasants, the greater part of them women (all the country women are old), in sabots, odd caps, and long blue aprons tied round their extremely capacious waists, most of them with more wrinkles than they had provisions to sell, all talking at once with the utmost good humor, and selling out of the paniers in front of them (to a crowd of bonnes and careful housewives with baskets on their arms) cheese, cabbages, lettuce, and many other known and unknown vegetables which would no doubt make savory soups and salads. A little apart others had knit-goods, linen, crocheted lace, caps, sabots. There were, too, curious collections of dirty books, soiled, torn engravings, and old iron and brass, such as we had seen in Dordrecht and Rotterdam and spread out on the sidewalk around the Halles in Paris—a mass of rubbish which Americans would think fit only for the dust-heap; yet the sellers preserve it, pack it away carefully at night, and set it out early the next market day. I said sellers, but I never saw any one buying these rusty scraps. An anarchist might like them to stuff a bomb with; but that would not explain the persistent offer of them for sale in provincial towns where there are no anarchists. Perhaps the custom is a survival, as well as the goods, and, indeed, like the market itself, which has much declined from its former greatness. Once it served for the exchange of the products of seventy-seven villages; a great quantity of wheat was sold there. But the Railroad, which sets up and abases as it will, has destroyed this commerce as well as the fruit market, where quantities of early fruit used to be brought every year. Buyers now purchase direct from the producers, and the hill town is deserted. Even the three annual fairs, which have been held for 700 years, have but a shadow of their former glory. Like the other cities, Clermont had a commune (established in 1197), sieges (the English pillaged and burnt it twice), and, in the early times before the counts of Clermont became dukes of Bourbon, on their way to become kings of France, it received many royal visits, and Charles le Bel was born there.

After all, the church should not be passed by in silence, for it has some good glass, with naïve inscriptions which recount:

*Comment* St. Zacharie au roi Liutprand fit rendre
Les villes qu'au S. Siège il avait osé prendre.
*Comment* S. Constantien des dons de Clotaire
Pour la gloire de Dieu batit un monastère.
*Comment* St. François auprès du St. Siège
Pour fonder son ordre reçut des privilèges.
*Comment* St. Charles pieds nus et corde au cou
Va de par le pays emplorant Dieu pour tous.

As in most French towns, the antiquaries of Beauvais have been industrious in preserving the memories of the past. Before the Revolution, they say, the city was crowded within its ramparts. The streets were tortuous and narrow, so that the projecting upper stories shut out much of the light. At night they were not lighted; for long after the fashion of street lamps had been introduced in Paris the authorities professed to the intendant of the province that they were too poor to buy and maintain them. Nearly all the houses were tiled, except in some outlying quarters where they were thatched. Many streets were not paved, and the paving where there was any was poor. In the three years preceding 1789 only 5,500 francs was spent in improving it. The houses drained into the street as in Philadelphia. A stream of dirty water ran down the middle of the way, and the public scavenging consisted in pushing, when it rained, the heaps of refuse that had accumulated since the last shower into the middle of the street, and trusting to the force of the current to carry it into the river. When the rain held off too long, the bailiff of the county would sometimes order the streets to be dug out; but this did not often happen. The ditch in the middle of the street, which had its parallel in London as late as Johnson's time, was picturesque in places, no doubt, as may still be seen in the lower parts of Amiens, where the tanners and dyers establish their workshops over such streams, finding the water convenient, and hang their skins and cloths on lines across the streets to dry. In Beauvais this would be done especially along the three or four little rivers which ran around and through the city, and which, with the fourteen bridges thus required, permitted the inhabitants to call it the Venice of France. Evidently Beauvais deserved better the first of the three epithets attached to it by its neighbors, "la ville puante, sonnante, et médisante." No wonder it was decimated by epidemics three times in the seventeenth century and twice in the eighteenth. And in the fifteenth we read of such a plague that when Louis XI. was to pass through it, his physician ordered great fires to be made in the streets to drive away the bad air.

One sees why the metric system was desired by reasonable Frenchmen. The confusion of weights and measures must have been unendurable. Before the change there were two kinds of feet, *le pied du roi*, twelve inches, and *le pied du comté*, eleven inches; the *mine* (a measure of grain) had fifty *verges*, but in some fields of the city the *mine* had only forty-eight *verges*, and in others only thirty-six; wood to burn was four feet long, but at Notre Dame-du-Thil it was three feet eight inches. There were two kinds of pounds, *la livre poids de marc* of sixteen ounces, and *la livre du comté* of fourteen ounces. About the measure of wheat there was so much difficulty that it was fixed at last by an act of the Parlement; but for barley and oats there were still two measures, that of Allonne and that of the Abbey of St. Lucien. A little variation of weights and measures, like our pound troy and pound avoirdupois, or the ton and the long ton, can be endured; but when every city had its own money and its own measures, and some, like Beauvais, had two or three, affecting not rare purchases but daily transactions, the life of the traveller could not have been a happy one. An American can get some idea of it by recalling the annoyances of travel in his country before we had our zone system of time.

What a change the Revolution made in France can be seen in the case of Beauvais. In 1789 the city was still thoroughly feudal in institutions and mediæval in aspect. Fortifications, churches, convents, bridges, crooked, dark, malodorous streets, low, leaning houses, open drains, had all been kept, with the ninety-two church-bells that gained for it the name *sonnante*. Of the buildings and the streets some remain, fortunately for the tourist and not to be regretted by the citizen, for we had repeatedly noticed that it is not necessary that streets should be wide in order to be clean, and it is not a great evil that the street in front should be dark, if the court or garden behind is light. There are still plenty of old houses jutting out at each story, frame houses, with the beams displayed and the intervals between built in with bricks and colored tiles, red, green, blue, yellow. Some ways are so narrow that one can touch each side. Every one walks in the middle, the sidewalks being most used for the display of goods and viands for sale. But early in the century the ramparts were levelled and made into pleasant walks; where old houses have disappeared the streets have been widened; since 1789 they have been lighted at night; refuse is removed by carts; the drains now go under ground, and even the larger streams were covered. The greater part of the churches have disappeared and with them their musical bells.

The political and social changes, however, are far greater than the material. The whole complicated, cumbersome, annoying system of feudal institutions was destroyed at a blow. Whether there was as great a gain to the happiness and morals of the people as there has been in their comfort and hygiene would require more than a day's stay to determine. One of their own writers, rejoicing that Beauvais is no longer *puante*, and lamenting that it is no longer *sonnante*, confesses that it is still *un peu médisante*. But this may be only his satire and not more to be trusted than satire in general.

At dinner there we heard a lively political discussion, which, if it did not teach us much, amused us with contrasts of character—the eager propagandism of a radical Boulangist, who even confessed that he might be a practical anarchist but that he was not yet tired of life, the timid interjections of a townsman, the seriousness of a Moderate Republican, the indifference of a group of commercial travellers, the courteous non-committal of a high military officer. It showed—what too many scenes in the Chamber of Deputies might sometimes lead one to doubt—that there are Frenchmen who can engage in a warm discussion without losing their heads. The future of the nation depends on whether there are enough of that sort. There have been warm discussions before this at Beauvais. There were the usual disagreements between the bishop, the chapter, and the commune, and, besides, the bishop and the chapter at one time fell out on religious questions. The chapter by intrigue procured an order of the court closing the choir of the cathedral to certain canons suspected of Jansenism, and indeed went so far as to refuse the viaticum to one of them.

The cathedral is unique. Before the nave was begun, the political and religious movement that produced the great cathedrals of northern France was ebbing. It left at Beauvais only a transept and a choir. But such a choir! so light, so lofty; the Gothic idea of leading the eye upward carried to its extreme. Nowhere but at the Sainte-Chapelle in Paris is there such perpendicularity. Even the lofty nave of Saint Ouen at Rouen and the cathedral aisles, which in their narrowness seem still more lofty, do not affect one as does

Beauvais. If the artist's conception could have been carried out, there would have been no nobler cathedral in France, and there would have been no need to say that he who should add to the choir of Beauvais the nave of Amiens, the portal of Reims, and the towers of Chartres, would have the finest church in the world. Here heightening stopped, for no one could surpass Beauvais, and its accidents frightened all architects from trying to imitate it. Twice the vaulting of the choir fell in, because the columns were too light and the buttresses too far apart. In the middle of the fourteenth century the architects, instead of building the nave, devoted all their energies to proving that the Gothic style could soar as far above the ground as the Renaissance was promising to do in the projected dome of St. Peter's at Rome. They succeeded in carrying their spire more than a hundred feet higher (half as high as the Eiffel Tower), but their work, though it had taken thirteen years to build, lasted but five. If it had only had support from the wall of a nave, we should possess it to day and not be forced to learn its features from an imperfect engraving in a rare history.

In nothing are the ravages which fires, storms, and revolutionary zeal have inflicted upon the ancient French churches more to be regretted than in the loss of the colored glass that once cast a mysterious light through their aisles; yet in almost all enough is left to emphasize the coldness of the plain windows and the inferior beauty of the later painted glass. Colored glass was meant at once to temper the flood of light thrown into the Christian temples by their great Gothic windows, and yet to warm, at least in appearance, the cold and sombre rays of the northern winter. But this was not all. "In pictura," says St. Gregory, "legunt qui litteras nesciunt, et vident quod sequi debeant." As Ruskin calls the sculptures of Amiens its Bible, the windows of a cathedral are an illuminated Bible. They taught the lives of the patriarchs, the sufferings of Job, the trials of Tobias, the courage of Judith, the royal power of Esther, the virtues of the saints, the patience of the martyrs; and if after all it was only a scholar here and there that profited much by the lessons, they were in that not unlike all education. In the choir of the cathedral at Beauvais are lovely windows, but not equal to those at Reims, which surpass all that we have seen in rich and harmonious color. At St. Étienne, too, are some good windows of the sixteenth century, in which the figures are more clearly defined than in the earlier work, and yet the colors are not so staring as in many lamentable productions of the present century. But the glass at Reims was like real gems, rich, soft, and brilliant at the same time, while modern glass is like imitation jewels, pretty but with no true gleam.

At Beauvais our tour substantially ended. It should have included Amiens and Rouen, but we were obliged to hurry back to Paris, only stopping over a train at Beaumont, a hill-side town, to see a church of the thirteenth century and the remains of a château. We enjoyed this trip so much that we hope many of our countrymen will take it, but, as I said before, others equally interesting can easily be arranged.* C. R.

*Our course was as follows (a * marks a stay over night, a † a cathedral, a ‡ a castle): Soissons *†, Reims †***, Laon †*, Coucy ‡, Noyon ‡*, Compiègne †*, Pierrefonds ‡. Clermont *, Beauvais †*, Beaumont ‡. Only Compiègne, Pierrefonds, and Beaumont are in the Ile-de-France proper; the others except Reims are in that part of Picardy that was annexed to the Ile-de-France for Government purposes. Reims is in Champagne; but it may well be joined with the rest since the architect of Reims Cathedral, Robert de Coucy, was from the Domaine Royal, as the Ile-de-France is called, and the city itself is not far from the borders.

## PASQUIER'S NAPOLEONIC MEMOIRS.—IX.

PARIS, June 20, 1894.

THE fourth volume of the memoirs of Chancellor Pasquier has not the same dramatic, one might almost say epic, character as its predecessors. It extends from 1815 to 1820, and is the history of the first years of our parliamentary and constitutional government. The experiment took place under the most difficult circumstances. The Duke de Richelieu, who was intrusted with the task of forming a cabinet after the dismissal of the Talleyrand-Fouché cabinet, was a stranger in his own country; he enjoyed the favor of the Emperor Alexander of Russia, but for that reason was not quite sympathetic towards England and Austria. He had to negotiate with the allies on many points of the greatest importance. One day he returned from the conference with the foreign plenipotentiaries pale and trembling. "I am lost; I am dishonored; yes, after what I have just consented to, I ought to be hung. I am a sacrificed victim. Why did I return to my unfortunate country? It would have been better to flee to Asia." He obtained, however, better terms than any other person would have done, thanks to the great esteem which the Emperor Alexander felt for him: the military occupation of France, which was to last seven years, was reduced to five; the war indemnity was reduced from nine hundred to seven hundred millions (compare these terms with what France had to accept in 1871); the frontier of France remained what it was before, with the exception of Landau, which was given up; the fortifications of Huningue had to be demolished.

The trial of La Valette took place during these negotiations. La Valette had assumed the functions of postmaster-general. On the 20th of March, even before Napoleon had entered the capital, he sent couriers to him, and a circular to all the departments, in these terms:

"The Emperor will be in Paris in two hours. The capital is in a state of the greatest enthusiasm. All is quiet, and, whatever may be said to the contrary, there will be no civil war. 'Vive l'Empereur!' Signed: the Councillor of State, Postmaster-General, Count de La Valette."

The consequences of this act of open rebellion on the part of La Valette had been null, and he had acted only after the departure of the King. The coöperation of the humblest officer of the army which had joined the ranks of Napoleon's increasing force had been more important. Nevertheless, it was impossible that La Valette should not be tried for high treason. He was personally liked and popular. Marshal Marmont, Mme. de Vaudémont, and Pasquier, who was La Valette's personal friend, did all they could in his favor; but he was condemned to death. In vain did Mme. de La Valette throw herself at the feet of Louis XVIII. and ask for the pardon of her husband.

"At six o'clock P. M.," says Pasquier, "there was no longer any doubt; pardon had been refused. I went to Mme. de Vaudémont; she was, like myself, extremely sad, and we were exchanging our fears when she was advised that somebody was asking for her. She left me, and I half saw in the next room a man unknown to me, who was greatly agitated. I was struck by the change of countenance in Mme. de Vaudémont when she came back to the drawing-room; she was almost gay. When I returned home, I told Mme. Pasquier that I should be much mistaken if M. de La Valette had not made his escape from his prison."

The escape was conceived by a M. Baudus, who had been a journalist in Hamburg during the emigration. La Valette helped him when he returned to France and got him a position as preceptor to the son of Murat at Naples, and afterwards as translator at the Foreign Office. Baudus felt much gratitude and affection for La Valette, and he contrived a plan of escape, which succeeded. Mme. de La Valette was very tall, and was always enveloped in mantles and furs; she went to see her husband in prison, they exchanged clothes, and he escaped almost miraculously. At the door of the prison he was not hindered by the porter, who was unsuspicious, and he immediately entered a carriage which was kept in readiness by Baudus. He took refuge in the apartment of a high official of the Foreign Office, M. Bresson, in the hôtel of the Foreign Office, where the police did not think of searching for him; and not till after a fortnight was he taken in an English uniform in a carriage to Compiègne by Col. Hutchinson. There he entered the carriage of Gen. Wilson, who conducted him to Belgium, and he retired to Bavaria, at the house of his cousin, Prince Eugène de Beauharnais.

The trial of Marshal Ney took place at the same period. Ney had, unfortunately for himself probably, denied the competence of the council of war, and the council of war had also declared itself incompetent to pass judgment on him, as the marshal was a peer of France and could be tried only before the House of Peers. The marshals and generals who composed the council of war were only too happy to wash their hands of a most painful commission. But, says Pasquier, "what cannot be understood, without having seen it, was the revolting passion which manifested itself in the ranks of the highest society; nothing could truly paint the attitude and the language of some drawing-rooms. I saw men of good family put on the uniform of the national guard, which they had never worn, solicit and obtain the privilege of mounting guard at the door of the prison, and watch the room where the marshal was confined, not trusting anybody but themselves in their anxiety to prevent an escape."

Ney's trial is one of the most dramatic episodes of the Restoration. The military convention which had opened the gates of Paris to the King had this article: "Persons and private property will be respected: the inhabitants and in general all persons in the capital will continue to enjoy their rights and liberties, without being disturbed on account of the posts they fill or may have filled, their behavior, or their political opinions." The Duke of Wellington was of opinion that Marshal Ney could not have the benefit of this convention because it had not been ratified by the King. "In good faith," says Pasquier, "would anybody have dreamed that this convention would not bind the King of France as well as the allies? Was not their cause common? Had the convention not been made in the interest of the sovereign to whom it opened, without any of the misfortunes which might have been feared, the gates of his capital?" Ney was condemned: the Duke de Broglie was the only peer who answered negatively the questions put to the House. "The decree," says Pasquier, "was rigorous, but was it unjust? I think not; I believe no tribunal could have escaped the necessity of condemning the marshal. But the capitulation ought to have hindered the judgment; it ought to have decided the sovereign to pardon." Ney fell a few yards from the Palace of the Luxembourg, where he had been judged, under the fire of a few soldiers. The Russians did not conceal their indignation,

One of them said to one of the judges: "It is quite clear that you were not in the French army in Russia, for you would not speak as you do of the most prodigious man of that army, of the man whose heroic courage saved its remnants, and to whom forty thousand of your best soldiers owed their lives."

The condemnation of Ney and of La Valette, instead of making the task of the restored dynasty easier, made it more difficult. There was in reality a gulf between the people and the dynasty; the forms of parliamentary government covered it for some time, but in reality the country was never quite reconciled to the Bourbons. It requires the pen of a Macaulay to render parliamentary history very interesting. I must confess that Pasquier is often fatiguing when he speaks of the discussions of the chamber, the changes of cabinet; he enters into the most minute details concerning affairs which have now lost much of their interest, concerning laws which are forgotten, concerning rivalries which have lost their meaning. The impression which the reader receives is that of a permanent hostility subsisting between the nation and the dynasty, and of a sort of artificiality in the political life of the constituted powers. There was below the surface an undercurrent of hostility, somewhat analogous to that which existed between 1814 and 1815, and made the return of Napoleon from Elba such an easy and astounding triumphal march.

Bonaparte was now too far off; he was in a prison from which he could not escape. It is nevertheless the belief of Pasquier that he contrived at St. Helena to keep up some secret communications with France. The history of the conspiracies which took place during the first years of the Restoration is told minutely by Pasquier, and with the exactitude which might be expected of a former prefect of police. First we have the conspiracy of Grenoble. The department of Isère was one in which Bonapartist sentiment had always been very ardent. Napoleon had been received with acclamation in Grenoble in March, 1815. The head of the conspiracy was a man called Didier, who had been a lawyer and a professor of law. He was hidden in the mountains of Dauphiny, and, with some hundred mountaineers, tried to seize Grenoble in the night. The rebels were attacked and routed by Gen. Donnadieu. Eleven of the prisoners taken were condemned and shot. Didier fled to Turin, was extradited and executed. A more important conspiracy was formed at Lyons in 1817; many arrests were made and many condemnations pronounced. Some persons openly accused Gen. Canuel, who was in command at Lyons, of having secretly been an accomplice, and scandalous debates took place on that subject.

At the end of June, 1818, Pasquier, who was then minister, received an extraordinary revelation. "An officer of gendarmes had entered into a conspiracy with some officers, among whom were Generals Canuel and Donnadieu; they had resolved to arrest the ministers at Saint Cloud, after the council, and to take them to Vincennes. They intended to force the King to change his cabinet. They hoped to execute their project with the help of two regiments, one a Swiss regiment, the other the regiment of the cuirassiers of the guard, commanded by M. de la Rochejacquelin. A letter from Gen. Donnadieu, found in the papers of M. de Chateaubriand and sold to the police, seemed to prove that the famous author of the 'Genius of Christianity' was not ignorant of the plot. The conspirators met every day on the deserted terrace of the Tuileries, which is parallel to the river, and in the histories of the Restoration this plot goes by the name of the "conspiration du bord de l'eau." Pasquier was of opinion that the conspirators should be allowed to act in order that a regular prosecution might have material enough to justify arrests and examinations of witnesses. The Government preferred to resort to arbitrary arrests and to anticipate the conspirators. The two suspicious regiments were sent away; Gen. Canuel disappeared, and no papers were found in his house. He returned and was arrested with a few others, but, in the absence of any proof, was set at liberty.

Pasquier gives many details about another much more important plot, which had for its object the proclamation of Napoleon II., in the eyes of some of the conspirators, and in the eyes of others the proclamation of a republic. The agents of the plot travelled all over France, and placed themselves in communication with the discontented officers of the army. Pasquier thinks that the banker Laffitte gave funds to the conspirators.

"When," says he, "Laffitte had to render an account to the executors of Napoleon, he could not justify the employment of a sum of 1,500,000 francs; he had no receipts to show from Napoleon, or Bertrand, or M. de Montholon. However, these gentlemen allowed the expense. It was because they knew very well that M. Laffitte had conformed to the intentions of his master, probably in obedience to verbal orders which had reached him in some particular way. This important fact proves clearly the part which Bonaparte, though he was shut up in Saint Helena, played in the agitations which tormented France as long as he was alive. This observation on the part which the Bonapartist party played till 1821 is fully confirmed by another observation: after the death of Napoleon, conspiracies ceased entirely in France."

# Correspondence.

## THE COLLEGE ANARCHIST.

To the Editor of The Nation:

Sir: Your statement in the last *Nation*, to the effect that there is a sort of moral justification for attacks upon life and property based upon a theory which comes from the colleges, libraries, and lecture-rooms, and latterly from the churches, is supported by the teaching and the practice of the University of Wisconsin.

Prof. Ely, director of the School of Economics, believes in strikes and boycotts, justifying and encouraging the one while practising the other. Somewhat more than a year ago a strike occurred in the office of the *Democrat* Printing Company, the State printers. An agitator or a walking-delegate came from Kansas City to counsel and assist the strikers. He was entertained at Prof. Ely's house and was in constant consultation with him. A little later a strike occurred in another printing office in this city, in which Prof. Ely was also an abettor and counsellor. He also demanded of the proprietors that their office should be made a union office, threatening to take his printing away if they did not comply. (They were publishing a paper for him as secretary of some organization or association.) Upon the refusal of his repeated demands, Prof. Ely withdrew his printing, informing them that he had always been in the habit of dealing with union offices. In conversation with one of the proprietors he asserted that where a skilled workman was needed, a dirty, dissipated, unmarried, unreliable, and unskilled tramp, if a union man, should be employed in preference to an industrious, skilful, trustworthy non-union man who is the head of a family. He also stated that the latter would have no ground of complaint, as he could easily remove the objections to him by joining the union, and that conscientious scruples against joining the union would prove the individual to be a crank.

Such is Ely the citizen and business man—an individual who can say to citizens and taxpayers, "Stand and deliver, or down goes your business," and to laboring men, "Join the union or starve with your families." Prof. Ely, director of the School of Economics, differs from Ely the socialist only in the adroit and covert method of his advocacy. A careful reading of his books will discover essentially the same principles, but masked by glittering generalities and mystical and metaphysical statements susceptible of various interpretations according as a too literal interpretation might seem for the time likely to work discomfort or loss to the writer. His books are having a considerable sale, being recommended and advertised by the University and pushed by publishers and dealers. Except where studiously indefinite and ambiguous, they have the merit of such simplicity of statement as makes them easily read by the uneducated. They abound in sanctimonious and pious cant, pander to the prohibitionists, and ostentatiously sympathize with all who are in distress. So manifest an appeal to the religious, the moral, and the unfortunate, with promise of help to all, insures at the outset a large public. Only the careful student will discover their utopian, impracticable, or pernicious doctrines, but their general acceptance would furnish a seeming moral justification of attacks upon life and property such as the country has already become too familiar with.

Very truly yours, Oliver E. Wells.

Department of Public Instruction,
Madison, Wis., July 5, 1894.

## BACK AND FORTH.

To the Editor of The Nation:

Sir: Your learned English correspondent, "F. H." (whom I take to be Dr. Fitzedward Hall), says, in the *Nation* of last week, "That *back and forth* was ever better than a provincialism is unlikely." I suppose if we can show him "forth and back" in a good author of three hundred years ago, he would see that it might once have been a good English usage. Now, in that interesting version of the Psalms begun by Sir Philip Sidney (who died in 1586) and finished by his sister Mary, the famous Countess of Pembroke, occurs this verse, in the 139th Psalm:

"If forth I march, Thou goest before;
If back I turn, Thou com'st behind;
So *forth nor back*
Thy guard I lack;
Nay, on me too Thy hand I find.
Well I Thy wisdom may adore,
But never reach with earthly mind."

What may give this example a more curious value is, that the version in question, though the work of two such renowned and beloved persons, was never printed till more than two hundred years after Mary Sidney's death in 1621, but lay in Dr. Donne's beautiful handwriting till Mr. Singer published it in 1823. Fifty years later (1873) it was reprinted by Grosart; portions of it also by Mr. Ruskin more recently. F. B. Sanborn.

Concord, Mass., July 6, 1894.

# Notes.

The collection of Coleridge's letters to be edited by Ernest Hartley Coleridge will be manufactured for England and the United

States by the American publishers, Houghton, Mifflin & Co.

Mr. J. G. Cupples, the Boston publisher, has associated with himself Mr. H. W. Patterson, under the firm name of Cupples & Patterson.

The second volume of Mr. J. N. Larned's great compendium called 'History for Ready Reference—from the Best Historians, Biographers, and Specialists' (Springfield, Mass.: C. A. Nichols Co.) follows close upon the first, in judging which we judged also the series, so far as the scheme is concerned. Vol. ii. embraces both England, France, and Germany, for its longest articles, and we suppose that chance mainly has determined that the number of pages assigned to each should be 203, 240, and 120 respectively. Since Europe is also among the topics of this volume, filling 115 pages, it is evident that the countries just named can be studied, independently and in relation, in a pretty broad way. The bringing of the several histories down to date is noticeable, and we may specify under England the summary of the Corrupt Practices Act, the text of the Reform Bill of 1884-5, and the summary of the Home Rule Bill of 1892-93; under Germany the rupture and reconciliation between Bismarck and the Emperor. The article on Europe is from the editor's own pen, and is exceptional in not consisting of excerpts from other writers.

We can do little more than register the appearance of the tenth volume of the 'Catalogue of Scientific Papers' compiled by the Royal Society of London (London: C. J. Clay & Sons; New York: Macmillan). This is, we are left to infer, the second volume of the papers for 1874-1883, as it begins at Gissmann and ends at Pettersson. The periodical literature embraced in these references is world-wide, but the catalogue is wholly by authors and not by topics, so that its utility is primarily and almost exclusively biographical. Each name occurring in the catalogue of earlier periods is numbered consecutively on. Thus, Asa Gray starts in at No. 108, and in the course of two columns reaches No. 140; Clarence King begins at 2, S. P. Langley at 22, Simon Newcomb at 36, B. A. Gould at 62, Mathew Carey Lea at 47, J. L. Le Conte at 118—to cite only American examples, among which we have also turned up Elisha Gray, Arnold Hague, Joseph Henry, H. W. Henshaw, E. W. and Julius Hilgard, E. S. Holden, John and Joseph Le Conte, Benjamin and C. S. Peirce, etc. In the case of the elder Peirce there is an exceptional reference to biographical notices of him; and under B. A. Gould one remarks sundry errata detected in entries in the earlier volumes. The typography of this catalogue is sumptuous.

The second volume in Prof. Todd's "Columbian Knowledge Series" (Roberts Bros.) proceeds from the librarian of Amherst College, Mr. W. I. Fletcher, and is upon a theme in which this author is an expert, viz., 'Public Libraries in America.' In brief chapters he touches on the history of the institution, the laws promotive of it, the buildings, selection and purchase of books, cataloguing, management, relation to the public schools, training of librarians, etc., describes some characteristic libraries and librarians, and supplies in an appendix a variety of statistics. We see Massachusetts at the head with more than 200 public libraries, containing 2,000,000 volumes, or almost as many as those in all outside public libraries in the Union, and an average of 1.23 volumes to each inhabitant; leading, too, in a law for encouraging the establishment of libraries, which New Hampshire adopts and betters by making taxation to that end compulsory, with State aid. Mr. Fletcher remarks that one-half of the 100 largest free libraries in the country have female chief librarians. There is a discrepancy on pp. 15, 25 as to the number of towns and libraries in Massachusetts, and in appendix ii. the Cornell Library should have an added reference on p. 138, viz., to No. 25 on p. 139, since its Dante collection is now preëminent; so Dante should have a reference back to Cornell.

Mr. Fletcher's appendix offering a scheme of classification is printed by itself, with some modifications, in a larger form by the same publishers, under the title, 'Library Classification,' and will no doubt serve a useful end. Still another scheme, of 1,000 heads, borrowed from the Dewey classification, is to be found in 'Hints to Small Libraries,' by Miss Mary W. Plummer, librarian of the Pratt Institute, Brooklyn. This is a very clear and practical book of instructions daintily printed, and may heartily be recommended to the inexperienced.

It was well worth while to collect the late Prof. Baynes's essays on Shakspere ('Shakespeare Studies, by Thomas Spencer Baynes,' Longmans). The chief of them, the article "Shakespeare" in the 'Encyclopædia Britannica,' is well known as a robust and sensible piece of combined criticism and biography, and loses nothing by being printed in a book easier to handle and to read than a cyclopædia volume. The other Shaksperian studies were contributions to periodicals, and ran the risk of being overlooked even by special students. They were all worthy of reproduction. The most important is that on "What Shakespeare Learned at School"; the least considerable, that on "Shakespeare Glossaries." Why the detached article "On English Dictionaries" was appended to the series, it is hard to see. It is now hopelessly out of date, and never was of very much consequence. Prof Lewis Campbell contributes a good biographical sketch of the author.

The progress in pessimism which the successive novels of Valdés seem to show, suffers no check in his latest volume, 'The Grandee' (London: Heinemann), in which he surely lets pessimism have its perfect work. Even his humor of other days has little to represent it here except cruel practical jokes, while the main characters of his story are such moral perverts or monsters that the account of their hideous doings reads like an essay in teratology. The climax of the book consists in the fiendish tortures to which a little girl was subjected by her mother. It is useless to waste words in disputing whether this is realism or not, or whether it is a mere diseased ferocity; so repellent a book cannot be dismissed too quickly by the reviewer, or forgotten too soon by the public. The translator, Rachel Challice, appears to have a good knowledge of Spanish, though a deficient knowledge of idiomatic English.

What the Hibbert Lectures have done for London in attracting Continental scholars as lecturers, the Gifford Lectures promise to do for Edinburgh. Prof. Pfleiderer was chosen Gifford Lecturer for 1894, and the lectures which he read in Edinburgh in January and February are already out in two volumes, 'Philosophy and Development of Religion' (Edinburgh: Blackwood; New York: Putnams). In his introduction he cleverly, if somewhat daringly, ingratiated himself with an Edinburgh audience by citing the names of Knox, Hume, and Carlyle, as those of men who had passed on the torch of "Natural Religion" from one to the other. In his first volume he plunges into the deep waters of theological speculation, in which those who choose, or can, may follow him. Leaving this philosophy of religion, in which we cannot consider him strong, he takes up in his second volume the history of the actual development of religion, in which everybody knows that he is particularly strong. He freely draws on matter of his own previously published, and makes a compact statement of the history of Christianity, viewed critically, from its beginnings down to Luther.

Dr. Mary Putnam-Jacobi's '"Common Sense" Applied to Woman Suffrage' appears in the "Questions of the Day" series of the Messrs. Putnam, and is avowedly a tract aimed at the New York Constitutional Convention now sitting. Its punning title obscurely intimates a proposed lightness of touch which proves to be not congenial to this writer, and which is conjoined with evident haste and carelessness both in composition and in printing. It is Paine's 'Common Sense' which Dr. Putnam-Jacobi undexterously endeavors to apply to her chosen topic. There is a wealth of historical citation, duly attested by footnotes, which is out of key with the humor of the conception, and which is invalidated by some extraordinary perversions of the history of the rise of the woman's-rights agitation in this country in connection with the anti-slavery cause, as well as by want of discrimination in the use of authorities. Much easier reading is the appendix, an address by the same author, on behalf of the women of the city of New York, before the suffrage committee of the Convention on May 31. The levity of Dr. Jekyll here gives way to the gravity of Mr. Hyde; and sparkle, looseness, and helter-skelter are replaced by a restrained and coherent argument, devoid of all semblance of pedantry, and worthy of the occasion. Its object being to convince, this tract should have been turned end for end.

M. Gustave Allais has been giving a course on Racine's drama, during the past winter, at Rennes, and intends to publish the result of his studies in book form. A sample has already been issued in the shape of a pamphlet containing his opening lecture, 'Le Théâtre de Racine' (Paris: Thorin & Fils), which forms very entertaining reading and whets one's appetite for the completed work.

Mélanie Scheler's 'Aimer, souffrir et croire' (Brussels: Parent & Cie.; New York: Dyrsen & Pfeiffer) is a collection of sentimental, wishy-washy rhymed prose, the publication of which is inexcusable, even if "friends" did press the too willing authoress to inflict it on the public.

Jean Bertheroy's 'Le Mime Bathllye' (Paris: Colin & Cie.) has apparently been inspired by Flaubert's 'Salammbô' or 'Hérodias,' but the inspiration has not produced a masterpiece. The sensual side of Roman life in the time of Augustus, the rivalry of two pantomimists, and the shady side of society generally have attracted the young writer more than his account of these things will attract the public.

A really strong novel, well worth reading, is 'Pour un Faux,' by Count Wodzinski (Paris: Calmann Lévy; New York: Charles Eitel). It is a story of Jewish rapacity and Christian weakness, of temptation, fall and recovery, which claims the reader's interest from the start and holds it to the very end. Genuinely realistic, in the best sense of the word, 'Pour un Faux' can be read by any one, and is proof that, Maupassant to the contrary notwithstanding, the story of a pure woman's life and sorrows may be made deeply interesting.

M. Marcel Prévost, who writes in the Paris *Temps* on "The World of Sentiment," has written a novel, 'Les Demi-Vierges' (Paris: Lemerre; New York: Meyer Frères & Cie.), in which he professes to give a true picture of the effect of so-called modern or English education upon the French girl. If we are to accept this as bona-fide on M. Prévost's part, the conclusion is irresistible that he has been fooled into believing demi-mondaines women of good society, or that he has so foul a mind himself that he can see nothing but foulness anywhere. His whole work is false, inconsistent, and evil in tendency, expression, and effect. He is absolutely ignorant of home life and family education, and thoroughly *au fait*, on the other hand, with that peculiar portion of society which is supposed to flourish nowhere so luxuriantly as in Paris.

The latest issues of Seuffert's "Deutsche Litteraturdenkmale des 18. und 19. Jahrhunderts" (Stuttgart: Goeschen) are 'Ausgewählte kleine Schriften von Georg Forster' (Nos. 46, 47), edited by Albert Leitzmann of Jena, and 'Wilhelmine von Moritz August von Thümmel' (No. 48), reprinted from the first edition of 1764 and edited by Richard Rosenbaum of Berlin. 'Wilhelmine oder der vermählte Pedant' is one of the best of those prose epics, chiefly of a comical or sentimental character, which enjoyed a certain popularity in the latter half of the eighteenth century, but very few of which deserve republication. Far more important are the minor writings of George Forster, who was one of the most remarkable men of his time, and whose suggestive contributions to ethnology, natural history, and politics may still be read with pleasure and profit. The seven essays contained in the present volume are admirably selected. Other recent numbers of this valuable series are 'Von deutscher Art und Kunst einige fliegende Blätter' (40 and 41), 'Gedichte von Johann Nicholaus Götz aus den Jahren 1745-1765' (42), and 'Goezes Streitschriften gegen Lessing' (43-45). The last-mentioned work is carefully edited by Erich Schmidt, and will interest all students of Lessing, on the principle *audiatur et altera pars*. Indeed, the entire series is excellent in both plan and execution.

The same publisher has issued a timely pamphlet of forty-seven pages entitled 'Zur Kenntnis des Marxismus: kritische Skizzen,' by Dr. Arthur Mülberger, the author of a volume of 'Studien über Proudhon'; and a fourth edition of Prof. Theobald Ziegler's 'Die sociale Frage eine sittliche Frage' (pp. 182). Both writers repudiate all schemes of State socialism as absurd and inefficient, and advocate the moral improvement and intellectual elevation of the individual, and the greatest possible economic and political freedom, as the sole basis of social reform.

A voluminous Spanish-Zapotec dictionary has just been published at Mexico by the Junta Columbina of the City of Mexico, in a splendid folio having two columns to the page. The above Junta obtained the manuscript for publication from Don Porfirio Diaz, President of the republic. We calculate that the work contains about 10,000 Spanish terms, while the Zapotec vocables are more numerous. A dictionary containing the same Zapotec terms first and the Spanish second has not yet been discovered. The manuscript of what has been published is a huge quarto volume, also written in two columns; its apparent date is the middle of the eighteenth century, but it has neither title nor preface, and is bound in parchment. There is nothing in it to indicate the author's name, though on its back we read: "Dictionario sapoteco del Balle." It is evidently a clean copy of an earlier manuscript. The orthography of the Spanish terms is by no means a model of correctness. The dialect differs not inconsiderably from that of Cordoba's vocabulary. The Zapotec people, who speak this language in several dialectic forms, occupy a large tract in the southeastern portion of the State of Oajaca, in southern Mexico, and reckon a population of about 260,000 Indians, or as many as there are Indians on all the United States reservations. They are an intellectual and peaceable nation, and in ancient times were warlike and powerful. The ruins of Mitla and other remains of monumental splendor stand upon their domain.

The *Archivio Storico dell' Arte Italiana* for March-April (but just issued) contains a richly illustrated article on the exhibition of Ferrara-Bolognese masters now being held at the Burlington Fine Arts Club in London. Among the illustrations is one of a "Nativity," the earliest existing work by Garofalo. This interesting and beautiful picture, forming until recently part of the Borghese Gallery, has lately passed into the hands of Mr. Theodore M. Davis of Newport, R. I. If historical collections must break up, it is to be hoped that other Americans will follow the example of Mr. Davis, and procure us our share of the spoils.

Dr. Veeder of Lyons, N. Y., announces that the Jackson-Harmsworth polar expedition, starting from London this month for an extended sojourn in the arctic regions, will coöperate in observing the aurora borealis upon the concerted plan in use by a large number of observers in various parts of the earth, and by the expeditions of Lieut. Peary and Dr. Nansen, thereby insuring, with what has already been done, the continuance and perfecting of these observations, which are leading to results that promise great practical value, not only to astronomical and meteorological science, but to physical research in general.

We have already spoken of the Tennyson cross to be erected on the western end of the Isle of Wight. An American subscription committee has been formed, of which the secretary is Miss Fay Davis, whose address is care of Mrs. James T. Fields, Manchester, Mass.

—The summer note is clearly struck by *Scribner's* for July in its opening article on "The North Shore of Massachusetts," wherein Mr. Robert Grant describes alluringly the near-by seaside resorts of Boston, ranging from Nahant to Cape Ann, where a more rational method of recreation is pursued than prevails at more fashionable and more bustling places. Prof. N. S. Shaler's article on "Beasts of Burden" has nothing to say about the horse, but includes the sheep, on the ground that "each year's fleece often amounts in weight to eight to twelve pounds, and in its lifetime the animal may yield a mass of wool far exceeding its weight of flesh and bones in any time of its life." A very interesting article, in these sociological times, is that in which Mr. Ernest Flagg proposes a plausible cure of the tenement-house evil, which, according to him, has arisen from the division of New York city blocks into lots of 25x100 feet, and can be materially abated by building houses square, or as nearly so as possible. By diagrams and figures he demonstrates that while four tenement-houses built on four city lots after the prevailing custom, and thus occupying 10,000 square feet, will afford only 2,060 feet of space devoted to light and air, a single square building on the same ground, constructed with a central court-yard, will afford 3,060 feet of such space, the available rental area being the same in both instances. Moreover, the proposed innovation has the added advantage of effecting a saving of 15 per cent. in cost, the calculation being for a six-story structure. If these estimates commend themselves to the experts, they are of far-reaching importance, and form a valuable contribution to the solution of a serious problem. Worthy of mention, also, is the initial article of a series which Carl Lumholtz is to contribute, treating of the cave-dwelling Indians of Northern Mexico.

—The literary traditions of the *Atlantic* are not belied in a first instalment of the letters of Sidney Lanier, edited with graceful comments by William R. Thayer. The letters printed in this number were written in 1875-76 to Gibson Peacock, editor of the Philadelphia *Evening Bulletin*, who had been one of the first critics to recognize Lanier's poetic gift, and befriended him when he was in great need of friends. They are pleasant reading, revealing, as they do, a sensitive and poetic soul. A rare literary aroma, too, pervades an anonymous article entitled "The City on the Housetops," which owes its charm entirely to the perfection of its form and to its skill in handling a simple theme in a genial manner. We must mention also an article on Lucretius and another on Coleridge. Besides these there is an instructive comparative study of the various forms of government in use in our principal cities, showing a tendency to concentrate power in the hands of mayors and appointed commissions rather than in elective bodies; showing also a helpless sort of groping in the dark, a readiness to make radical changes to meet temporary needs and to abandon at short notice the principles of popular government. One curious result of the investigation is that the only city which has a satisfactory government is Washington—the only city whose inhabitants have absolutely no voice in its government, the only city where no elections are held and whose citizens have no vote. This anomaly in our system attracted the notice of Prof. Bryce. We have already called attention to Prof. Laughlin's "Monetary Reform in Santo Domingo."

—*Harper's* opens with part one of Charles Dudley Warner's new story, "The Golden House." The reader is at once plunged into the giddiest eddies of the very centre of our best society, so familiar to him from some recent American novels; he has a vague sort of impression that in some previous state of existence he has seen and heard it all before; once more he is haunted with that problem in the rule-of-three: as the anise-seed bag is to a fox, so are "the four hundred" to an aristocracy; and, as on previous occasions, Mr. Warner stops every now and then to buttonhole the helpless reader and moralize *de omnibus rebus et quibusdam aliis*. Fiction is strong in this number, as is proper. "Trilby" is continued, with a tragic turn; Miss Grace King has one of her short sketches, and Brander Matthews one of his. Owen Wister has a good story of the Southwest, and there are one or two more. Very attractive is the third part of Mr. Howells's account of his first visit to New England. In describing so frankly the ingenuous hero-worship with which he regarded the literary magnates of Boston, he somehow reminds one of Thackeray's young fellows. Incidentally he mentions that about 1860 he was a contributor to Henry Clapp's *Saturday Press*, and he quotes Dr. Holmes as

saying of Hawthorne, "He is like a dim room with a little taper of personality burning on the corner of the mantel." Of considerable practical interest is Commander Jewell's description of the United States naval gun factory, of which he is superintendent.

—Music-lovers should not omit to read Antonin Dvorák's article on Franz Schubert in the *Century*. In the first place, it is written with charming directness and a refreshing neglect of rhetorical flourish; secondly, it is interesting, not only for its subject, but also for the unhesitating manner in which Dr. Dvorák expresses his opinion on a variety of topics on all of which he is competent to speak. In citing Rubinstein's saying that Bach, Beethoven, and Schubert are the highest summits in music, he adds that he agrees in including Schubert in the list, but would amend it by adding Mozart. Schubert's symphonies he places next to Beethoven's, and far above Mendelssohn's. Another of his judgments is that the only departments of music in which Schubert did not reach the highest summit of achievement are opera and sacred music. Dr. Albert Shaw contributes another of his studies in municipal government in an account of "What German Cities Do for their Citizens" in the matter of water-supply, drainage, electric-lighting, etc. Once more he emphasizes the contrast between our methods and theirs—a contrast that may be explained by saying that in German cities the public business is managed with the same intelligence and integrity that we look for only in the case of private corporations or firms. Particularly to the point is the account of what has been done in Berlin, all within a generation, and much of it during the last two decades. The notice of the municipal pawnshops will be read with interest in view of the recent establishment of our public-loan society. Mr. Marion Crawford begins a story, "Love in Idleness," in which he lavishes sprightliness and epigram with his customary profusion; here, again, we are introduced into the midst of the American *haute volée*, but it is painful to observe that the conversation of the heroine is modelled on that of Dodo. Mrs. Burton Harrison also begins a story, "A Bachelor Maid," the future course of which practised novel-readers will have little trouble in divining.

—Regarding the word Notch, as denoting a pass between two peaks, a correspondent writes: "Mr. Matthews has proved the 'Century Dictionary' to lie under a mistake in limiting the use of Notch to Adirondack or White Mountain gaps. But the only two instances he mentions in Vermont are near the north line of the State, and might be supplemented by others nearer the heart of the Green Mountain range. A dozen miles southwest of Rutland, the pass as you go over the ridge separating Tinmouth from Middletown has been for generations called 'The Notch.' In fact, it looks like 'something cut or indented by art.' Nor did it therefore seem to the Yankee name-givers one whit less appropriate for describing a freak of Nature in which the good mother appeared to be emulating the whittling exploits of their jackknives. May there not even be discovered such a name as Jackknife Notch?"

—The commonwealth of Massachusetts has at last taken decided action to prevent the marriage of children in that State. In 1854, in the case of Parton vs. Hervey (1 Gray, 123), the Supreme Court there decided that "the age of consent, as fixed by the common law," was the rule, viz., twelve years in females and fourteen in males. It seemed that in 1833 an attempt had been made to alter the law, but it failed. Hence it followed that such infants could be married with the consent of parents. Of late years the efforts of various charitable societies had effected an increase of the limit of age in criminal cases, so that girls under sixteen years were held to be not consenting to their own harm; but the right of parents to dispose of their children under cover of law remained. A flagrant case in Boston, last winter, attracted attention, and the Legislature has at last given relief in a bill which may serve as an exemplar to other communities. It provides that "no town or city clerk or registrar shall receive a notice of the intention of marriage of any male under the age of eighteen years, nor of any female under the age of sixteen years"; but the judge of probate in any county, after due hearing, may make an order allowing the marriage of a minor under the age just specified, provided that said minor resides in a city or town within the county, and that the father, or in case of his death the mother, or, if neither parent is alive and resident in the commonwealth, a legal guardian, has given consent to such order. A certified copy of the order is the clerk's or registrar's warrant for issuing the certificate. This prevents a legal form of marriage, but the bill should have provided penalties for any parties who should proceed to join infants in marriage. Massachusetts, and probably other States, after adopting wise rules, proceed to nullify them by a law which says that any marriage is legal if either party thereto thought that the ceremony was valid.

—'The Operas of Gilbert and Sullivan,' described by Percy Fitzgerald (Philadelphia: J. B. Lippincott Co.), comes opportunely at a time when efforts are being made in several places to revive some of these works. The writer has allowed himself 248 pages and 60 illustrations to describe and picture the dozen operettas in which Gilbert and Sullivan have collaborated, as well as their principal interpreters, prominent among whom is Mr. Grossmith. There is no question that these men have created a new school of English opera, the first since Purcell, which did not live long. Probably the new school will not live far into the next century, but even if it dies, it will have supplied an enormous amount of harmless entertainment and hilarity to hundreds of thousands of theatre-goers—hilarity never aroused at the expense of propriety. Eighteen years these two writers have worked together, and Mr. Fitzgerald has collected from newspaper articles, interviews, and other sources a large amount of interesting information regarding the method of this collaboration. Most readers will be surprised to find out how much labor Mr. Gilbert expended on his librettos, working them over four or five times before he was satisfied. Strange to say, Mr. Gilbert "has no ear for music. He is very fond of it, but he would hardly be conscious of a discord. Time and rhythm he knows." But if he is ignorant of music, Sir Arthur Sullivan makes up for this by his fine ear for poetic accent. There have been operetta composers more enchantingly melodious and more richly harmonious than he, but in the art of fitting a poem with music as one fits a glove to a hand, he is a model for all dramatic composers. Mr. Fitzgerald shows that the stage-management and every detail of action and scenery, are in the Savoy Theatre, as rigidly under the control of the librettist and composer as were those at Bayreuth. And herein lies a large share of the enormous success of these operettas, which have made Sullivan one of the richest composers of all times.

## A RECENT SCHOOL OF CONSTITUTIONAL CRITICISM.

*Sources of the Constitution of the United States*, considered in relation to Colonial and English History. By C. Ellis Stevens, LL.D., D.C.L., F.S.A. (Edinburgh). Macmillan & Co. 1894.

THE Constitution of the United States as a subject for annotation, investigation, laudation, and disputation is fast coming to be about as bad as Shakspere. As with Shakspere, its supreme greatness in its own sphere was not perceived by contemporary men, and time swept away the authors of the instrument and cheated them of an author's rightful dues, the hearing of the chorus of praise, which arose when it was too late for them to hear it. Like Shakspere, the Constitution commands the attention of other nations than its own, and has its students and commentators and historians in other lands, writing of it in other languages. We shall soon be asking whether there is any other short work in the English language, except "Hamlet," about which so much has been written as the brief document which reposes in the State Department at Washington. In another way the Constitution also finds its parallel in Shakspere: writers at last appear to demonstrate that, after all, it was not original work; that it was but the "adaptation" of older plays to the modern stage, and that behind the framers was another Bacon.

Philadelphia seems, during recent years, to have become a hotbed of constitutional studies. The late Mr. Brinton Coxe, Mr. Meigs, Mr. McMurtree, Mr. Carson—all lawyers—and now the Rector of Christ Church, the old church in which Washington worshipped, have been at work at the same time. Perhaps it is the influence of Independence Hall upon studious natures; perhaps it is a growing belief among Philadelphians that the city contributed the Constitution to the national welfare, or that if there had been no Philadelphia there would have been no Constitution. Certain it is that Mr. Stevens always speaks, and sometimes in successive sentences, of the great Convention as the "Philadelphia Convention," "the convention at Philadelphia," "the Constitutional convention at Philadelphia," the "convenvention that met at Philadelphia"; and he gives fifty per cent. more references in his index to "Philadelphia" than to the "Constitutional Convention at Philadelphia," so that if one wishes to find a reference to the Convention the most certain place to find it is under "Philadelphia."

Mr. Stevens has been spoken of as an English writer—partly, we suspect, because he has put "F.S.A. Edinburgh" on the title-page, and partly because his book has been written to prove that the Constitution is English, and substantially every provision in it. He does, indeed, inscribe his work to the nations of the world "which in varying ways bore relation to the founding of America," to "Spain, Italy, France, the Netherlands," etc.; but these nations get very little credit outside of the dedication. It has also been supposed that the book was written to refute the work of the late Douglas Campbell, 'The Puritan in Holland,' which credits that country with much if not

all that is most valuable in the Constitution. But there is plenty of internal evidence in Mr. Stevens's book to show that he was engaged upon it long before the earlier work was published.

The striking peculiarity of his presentation is, that it sets forth what its author thinks and what everybody else thinks. Kent, Story, Bryce, Lowell, Sir Henry Maine, Sir Erskine May, and a score and more of other great authorities appear, on vital points, in copious extracts. Not only does Mr. Stevens devote a third of his pages to the smaller type of footnotes, but the text, which he reserves for himself, is verified and fortified by quotation after quotation. In matters of detail the book is generally unimpeachable. We have chapter and verse given us for everything; if the author is wrong upon a single point, some eminent authority must be wrong also. Mr. Stevens acknowledges "the earnest help and interest accorded by the late Sir Henry Maine," and we can easily believe that that eminent and judicious scholar rendered invaluable critical aid. There is also an absence of the technical mistakes that a layman would be apt to make in legal matters, which indicates the judicious criticism of some accomplished lawyer. It must also be conceded that the author treats fairly those with whom he differs. Mr. Douglas Campbell is allowed to state his side of the case and to speak in his own words. About the only great authority whom Mr. Stevens might have quoted and has not, is Burke. When laboring to prove that the 'Commentaries' of Blackstone "influenced the Convention," and the "legal influence" of that book was one of the links which bound America to England, he might have quoted with conclusive effect what Burke said in March, 1775, touching conciliation with America:

"I have been told by an eminent bookseller that in no branch of his business, after tracts of popular devotion, were so many books as those of the law exported to the plantations. The colonists have now fallen into the way of printing them for their own use. I hear that they have sold nearly as many of Blackstone's Commentaries in America as in England."

The reader who reads both the text and the annotations will have a pretty clear idea of what most of the great writers on the Constitution think.

Some of these footnotes also contain new matter of interest, as, for instance, a conversation between the author and President Hayes in 1889 on the personal power and influence of the President. Considering that Prof. Woodrow Wilson maintains that this power has been about swept away by Congressional encroachments, and that the ex-President is generally supposed to have been, so far as personal power and influence went, one of the least assuming, if not one of the weakest, of our Presidents, it is rather startling to find him, after his personal experience in office, standing among the men of the last century who saw in the executive power a menace to liberty. The conversation covers two closely printed pages, in which Mr. Hayes sketches the direct authority and indirect influence of the Executive, and asserts that they are far more potent than is usually supposed.

"If once," he says, "war exists, the President has the 'war powers,' and no man has defined what those powers are, or placed a limit on them. The executive power is large because not defined in the Constitution. The real test has never come, because the Presidents, down to the present, have been conservative, or what might be called conscientious, men, and have kept within limited range. And there is an unwritten law of usage that has come to regulate an average administration. But if a Napoleon ever became President, he could make the Executive almost what he wished to make it."

Mr. Stevens twice cites Charles Pinckney, though he omits his name from his index, as he also omits Landon's; and he twice quotes Pinckney's "Plan of a Federal Constitution," going so far as to say that "the first Amendment seems to have originated in the draft" of the Constitution which Pinckney submitted to the Convention. If the "Plan," as set forth in Madison's Journal and Elliott's Debates and the Journal of the Convention, were really the work of Pinckney, it would probably be regarded as the most wonderful contribution to the Constitution which was made by any one man, and the great instrument might even be called "Pinckney's Constitution, with modifications." But we have recently shown the want of contemporaneous value attaching to the MS. now in the archives of the State Department.

Notwithstanding the high authority of Chief-Justice Cooley (in a footnote), a writer on the Constitution in the year 1894 has no right to say that Trevett vs. Weeden was the first case after the Revolution in which legislative enactments "were declared unconstitutional." Such an assertion was justifiable a few years ago, but now betrays ignorance of the work done by President Scott, Prof. Thayer, Mr. Coxe, and other painstaking scholars. This part of the book, relating to the judicial power, is both superficial and contradictory. In the text it is said that "the colonial judiciary did not hesitate to adjudge a local statute invalid if it exceeded powers conferred by charter," and that "when State constitutions succeeded to the charters, the process was continued by the State courts." In the footnote, the only authorities cited for these broad assertions are "Trevett vs. Weeden in 1786, and Bayard vs. Singleton in 1789 [*sic*]." The former case, then, is the only authority which Mr. Stevens lays before his readers to satisfy them that in 1787 the Convention did nothing more than incorporate an existing State constitutional usage into the Constitution of the United States. This one authority proves nothing of the kind. There was no State constitution involved in the case; the statute did not conflict with the charter; the court did not hold it to be unconstitutional or void. A provision in the act was held not to deprive the defendant of the right to trial by jury; and the judges justified their action by other provisions in the same statute. Furthermore, the decision caused a tremendous uproar in Rhode Island; the judges were haled before the Legislature; they narrowly escaped impeachment, and were virtually turned out of office because of their decision. If there be an authority in the world which, standing by itself, conclusively proves that in 1787 the American people had neither adopted nor accepted the constitutional principle that the judicial power may declare void an act of the Legislature, it is this case of Trevett vs. Weeden.

Finally, it is to be observed that in this portion of his work Mr. Stevens has set himself the task of refuting that most careful and judicious of writers, Sir Henry Maine, when he says of the American judicial power that "there is no *exact* precedent for it either in the ancient or in the modern world"; and that it is a "*virtually* unique creation of the founders of the Constitution." Sir Henry Maine expresses here a philosophical conclusion of the whole matter with characteristic accuracy. No nation in the ancient or modern world possessed a judiciary beyond legislative control which could declare an act of the Legislature void. In 1787 the State courts had by no means established the principle. On the contrary, it had been, at best, but faintly recognized by the judiciary and not at all by the people. The six cases to which Gerry alluded were so little known that it is safe to say that there was not a member of the Convention who could have named them; they are now so shadowy that, with two or three exceptions, it is as hard to tell what they were as what they determined; and the vexatious condition of colonial vassalage furnished no real precedent for the regulation of a sovereign power. If Mr. Stevens will refer to Blackstone, who, he seems to think, taught the framers of the Constitution nearly all they knew, he will see that the final concession of the great teacher is that where the legislative intent is clear, he knows of no authority which can control an act of Parliament. Minute criticism is a valuable thing; but the petty criticism which undermines broad distinctions is a false teaching of constitutional history.

"The aim of the present work," says Mr. Stevens in a footnote, p. 206, "is to definitely settle" the fact that "*our peculiar institutions, those distinctive of America*, are derived from the mother country." We have seen that the English judicial power, in its relations with Parliament, and the American, in its relations with Congress, are the opposites of each other; that one cannot do what the other can; that in a given case the English judiciary is powerless, and the American supreme. In ordinary affairs, when we find that a thing has been radically changed we attribute to somebody the credit or discredit of having changed it. Gladstone, Maine, Bryce, and other foreign and, therefore, disinterested thinkers of the highest rank, attribute the change we are now considering to the framers of the Constitution. Mr. Stevens says, Oh, no, this is a mistake—that it was not "a novel contrivance of the Philadelphia convention"; that what "has been supposed to be the most unique feature of the American Supreme Court is really only another adaptation from the past, and rests upon colonial and English precedents"; that the American judicial system is nothing but an importation, and that its extraordinary power over legislation is not due to anybody in particular, but came about of itself by a process of what he calls evolution, during the colonial period. Given a fair amount of scholarship and an unrestricted right of deduction, with such reasoning *ad libitum*, and an author can march back on historic lines until it pleases him to encamp, and say, "Lo, here is the original habitat of the Constitution." One man can halt at the Petition of Right, another can go back until he arrives at Magna Charta; a third can cry, "Pooh! all the thunder of the Barons of Runnymede which is worth hearing was stolen from the civil law." At the beginning of the book Mr. Stevens quotes Mr. Gladstone's now celebrated saying that "the American Constitution is the most wonderful work ever struck off at a given time by the brain and purpose of man." Here he remarks that this does not necessarily mean that the Constitution "is wholly new," nor that it was in fact "an original creation of the convention which met in Philadelphia." Further on he quotes Prof. Johnson to the effect that the success of the Constitution, if it proves anything, does not prove that "a viable constitution can ever be struck off at a given time by the brain and purpose of man." At the end

of the book, he does not say, but certainly leaves the ordinary reader to infer from all that has been said and shown, that Mr. Gladstone is a rhetorical old gentleman, pitiably ignorant of American constitutional history. Now we all know that the framers of the Constitution did not construct a fanciful constitution to please themselves for an ideal republic as Locke did for the Carolinas; and we all ought to know that "adaptation" is generally the highest work of statesmanship. In a word, the reader of this book and of similar studies will find in them much that is useful, interesting, and curious, but, when he comes to deductions, had better be content with those of the great thinkers of the century, who, without the prejudice of theory, or against their earlier prejudices, have assigned to the framers of the Constitution the highest niche in the temple of statesmanship.

## EAST AFRICAN EXPLORATION.

*Discovery of Lakes Rudolf and Stefanie:* A narrative of Count Samuel Teleki's exploring and hunting expedition in Eastern Equatorial Africa in 1887 and 1888. By his companion, Lieut. Ludwig von Höhnel. Translated by Nancy Bell (N. D'Anvers). With 179 illustrations and 5 maps. 2 vols., octavo. Longmans, Green & Co. 1894.

THE extensive region lying between the Indian Ocean and the valley of the Nile, including southern Abyssinia and Galla and Somali lands, has been the field for various exploring expeditions during the past few years. Among the most successful was the one of which these volumes contain an account. Its leader was a Hungarian nobleman, Count Teleki, whose principal motive appears to have been sport rather than science. On the other hand, his companion and the historian of the expedition, Lieut. von Höhnel, an Austrian naval officer, proved to be an enthusiastic explorer and an excellent cartographer. He has since added to his reputation in these respects by his work in connection with Mr. William Astor Chanler's attempt to traverse this region from Mt. Kenia to the Gulf of Aden. This was brought to a nearly tragic end last summer, when a severe wound from a rhinoceros compelled him to return to the coast, to which Mr. Chanler, finding further progress impossible, has recently followed him.

Lieutenant von Höhnel's account of the expedition in which he won his spurs as an African traveller has very considerable merit and also labors under certain disadvantages. It is well written and contains many excellent descriptions of caravan and native life and customs, as well as numerous hunting and other adventures. A frank truthfulness characterizes it which inspires confidence in the author's statements, while he impresses himself upon the reader as a pleasant companion and a man of kindly sympathies for the natives. At the same time the various incidents in connection with the organization and conduct of an expedition in East Africa, on which he dwells with conscientious minuteness, are now very familiar, and he has not sufficient descriptive power to lend a new charm to such a twice-told tale. The greater part of the journey was through country which has been often described, and the new territory which was explored and in which the discoveries were made proved singularly uninteresting and forbidding. So much space also is given to Count Teleki's hunting exploits that not even the frequent spice of danger which attends them can prevent their becoming monotonous and wearisome. It is difficult at times to repress a feeling of indignation at the slaughter recorded, although it may have been necessary to provide meat for the porters. From an appendix containing extracts from the Count's game-book it appears that over three hundred and fifty head of large game fell to his rifle alone. This includes twenty-eight elephants and seventy-nine rhinoceroses, five of the former and four of the latter respectively having been shot in one day. Then the value, as well as the interest, of the narrative is somewhat lessened by reason of the long delay in its publication.

It was in January, 1887, that the expedition, numbering more than 300 men, left Zanzibar, and, with the usual delays incident to the movement of so large a body, proceeded to Mt. Kilimanjaro. Here several months were spent in making preparations for their journey northward from this point and in excursions, one of which was an unsuccessful attempt to reach the summit of the snow-clad peak, Kibo. The account of the mountain; of Taveta, the forest paradise at its foot in which they camped; of Masailand and its inhabitants, differs in no essential respect from those of other travellers. The Masai gave the expedition no trouble, being held in check, no doubt, by its size and strength. Though Lieut. von Höhnel casts some doubt upon the reputed bravery of this interesting people, they inspired the coast negroes with great fear, and a solemn religious service was held by the Mohammedans among them to secure their safety before penetrating into the heart of the country.

To the north of the plains roamed over by the Masai lies Kikuyuland, a strip of high lands from eight to thirty miles in breadth and about one hundred in length, with an elevation of from 4,500 to 6,500 feet. It is thickly populated by a courageous and industrious people, some districts being "so carefully and systematically cultivated that we might have been in Europe." Attention has been frequently directed to this country of late as being the most suitable for European colonization in eastern equatorial Africa, and the English have established one station, Fort Smith, on its border, on the line of the projected railway from the coast to the Victoria Nyanza. But at this time the Wakikuyu were very averse to the passage of strangers through their territory, and had shortly before completely destroyed a trading caravan which had ventured among them, and had compelled another, under the lead of Dr. G. Fischer, to "fight every inch of its way." Notwithstanding this neither strange nor unreasonable objection of the natives to the presence in their fields and villages of a large armed force, Count Teleki chose to pass through the entire length of the land, although apparently other routes to the hunting regions in the north were open to him. The author's account of the events of the six weeks spent in this country is the most exciting, though the least satisfactory, part of his work. The opposition of the natives, confined through the efforts of their chiefs, except in two instances, to threatenings, tedious negotiations, and refusals to sell food, were overcome partly by the persistence of the Count and partly by his repute as a rainmaker. This deceit he never hesitated to practise when it was for his advantage, and he more than once sold rain-medicine to the natives. Three times blood was shed—the last occasion being but a few days before the frontier was reached. A native threatened with his spear one of the head men of the expedition, who, by permission of the Count, fired on him, and a general volley ensued in which the two whites joined.

"Presently the natives began to run away, with our men, who were not to be held back, after them. Worn out with the perpetual *petty worries* of the preceding days [the italics are ours], our people were determined to pay their persecutors out now, and soon no one was left behind but the Count, Jumbe Kimemeta, a fewinvalids, and myself. We heard several shots in the distance, and then all was still. About an hour afterwards, smoke rising from the direction of the villages showed that they had been set on fire by the victors, and parties of our men began to return, screaming, singing, and dancing, as they fired off their own weapons and flourished those they had taken from their enemies. Nearly all of them were also driving cattle before them, while some had taken women and children prisoners. Soon the camp was so crowded with cattle, etc., that it seemed impossible it could hold more, and our men, drunk with victory, smeared with their own blood and that of their victims, presented a horrible appearance as they danced a war-dance opposite the tent of their master and laid their booty at his feet."

It is difficult, after reading this passage, to see wherein lies the difference, so far as the natives are concerned, between Count Teleki and an ordinary Arab slave-hunter, except that Tippoo Tib raids a district for the sake of gain; to the European nobleman a raid is a "regrettable" incident in his pursuit of sport.

An attempt was made by the Count to ascend Mt. Kenia, but he was obliged to turn back while still three thousand feet from the summit, although some distance above the snow-line. His companion was equally unsuccessful in an attempt to trace the Guaso Nyiro to its supposed outlet in Lake Lorian, to the east of the mountain, the field of his later explorations with Mr. Astor Chanler. The caravan route between the coast and the northern shore of the Victoria Nyanza was left at Lake Baringo, and the travellers set out in a northeasterly direction to seek the two great lakes said to exist in Samburu. It would be hard to exaggerate the difficulties or dangers encountered during this part of their adventurous journey. At times they traversed sandy plains over which the wind swept with the force of a hurricane. "We slept with our heads wrapped up in clothes, hardly able to breathe, and woke up completely buried in sand and dust." Long stretches of waterless desert had to be crossed, exhausting to the strength of their followers, and at length scarcely a day passed in which some one or more of their number were not reported dead or missing. But for the abundance of large game, elephants, rhinoceroses, buffalo, zebras, and antelopes of various kinds, which roamed over this wilderness, its passage would have been impossible. On March 6, 1888, the southern shore of the great lake was reached, and

"although utterly exhausted, after the seven hours' march in the intense and parching heat, we felt our spirits rise once more as we stood upon the beach at last, and saw the beautiful water, clear as crystal, stretching away before us. The men rushed down shouting, to plunge into the lake; but soon returned in bitter disappointment: the water was brackish! This fresh defeat of all our expectations was like a revelation to us; and like some threatening spectre rose up before our minds the full significance of the utterly barren, dreary nature of the lake district. Into what a desert had we been betrayed! A few scattered tufts of fine, stiff grass rising up in melancholy fashion near the shore, from the wide stretches of sand, were the only bits of green, the only signs of life of any kind. Here and there, some partly in the water, some on the beach, rose up isolated skeleton trees, stretching up their bare, sun-bleached branches to the pitiless sky. No living creature shared the gloomy solitude with us; and, far as our glass could reach, there was nothing to be seen but desert—desert—

everywhere. To all this was added the scorching heat, and the ceaseless buffeting of the sand-laden wind, against which we were powerless to protect ourselves upon the beach, which offered not a scrap of shelter, while the pitching of the tents in the loose sand was quite impossible."

Volcanic action was everywhere evident. Sixteen craters were visible from the point where the party stood, from one of which, as smooth and straight as a chimney, issued clouds of smoke. In attempting to cross a lava stream they found themselves in a "perfect labyrinth of pitfalls with brittle walls of from some thirteen to sixteen feet in circumference. The upper covering of many of these holes was in many places torn asunder, revealing the inside, bristling with stalagmite-like spikes and edges as sharp as knives."

The lake, which they named Rudolf, after the late Crown Prince of Austria, proved to be not far from two hundred miles long by some twenty-five broad. For nearly a month they struggled along the dreary eastern shore, in imminent risk of perishing for want of food and water, until the northern end was reached. Here they found a habitable and well-populated region, but they were unable to pass through it, the opposition of the natives being too formidable for the greatly weakened expedition to overcome. A week's journey over a terrible country brought them to the shore of the smaller lake, called by them Stefanie, after the Crown Princess. Little more was done, however, than to demonstrate its existence, the few poverty-stricken natives living near it having no food to sell to the caravan. Lieut. von Höhnel climbed a hill on its eastern shore, from which the northern extremity was dimly visible, and he conjectures its size to be seventy-five miles long by fifteen broad. The water is very brackish and is evidently rapidly receding. The beach was strewn with fish, "which lay about in great quantities in various stages of decomposition." When the southern end of Lake Rudolf was again reached, an attempt was made to explore the western coast, which proved to be far less sterile than the eastern. But a famine raged among the inhabitants and they refused to sell either cattle or grain. At length the retreating expedition was reduced to such extremities that another raid was ordered and successfully accomplished, though whether the natives lost more than their cattle we are not informed. No special incident marked the return journey to the sea, where the explorers arrived on October 24, 1888, after an absence of nearly two years.

It is impossible in reading this narrative, characterized by much modesty and simplicity, not to be struck with the rare combination of the qualities that go to make a good traveller and explorer which both Count Teleki and his companion possessed. Their expedition will rank high in the annals of African travel, if not for the importance of their discoveries, for the success with which obstacles to which most men would have yielded were overcome. Of their thoughtfulness for their men there can be no question, and, with the two exceptions which we have noted, they were apparently always considerate and tactful in their dealings with the natives. An abstract of some of the scientific results of the expedition is given in an appendix. These consist of a partial list of the collection of specimens of the fauna and flora of the regions visited, made by Lieut. von Höhnel, and containing, among many other new species, four of reptiles, fifteen of butterflies, and sixty of beetles. He has also drawn an admirable map of his route, and given some excellent pictures of the natives and their various implements and ornaments. The hunting scenes are not of equal merit, and do not add to the value of the work, whose usefulness for reference is increased by a good index.

---

*Readings on the Inferno of Dante.* Chiefly based on the Commentary of Benvenuto da Imola. By the Hon. William Warren Vernon, M.A. With an introduction by the Rev. Edward Moore. 2 vols. Macmillan.

THAT the son of Lord Vernon, whose edition of Dante remains a marvel of sumptuousness, should be a Dante scholar of a high order, seems but natural. He has already edited the "Purgatorio" in a fashion similar to this edition of the "Inferno," and he hopes to complete his work with two more volumes on the "Paradiso." Adequately to review the present volume would require time and space beyond the limits imposed by the conditions of a weekly journal. The "Inferno" contains 4,720 lines; Mr. Vernon's commentary thereon exceeds 1,300 pages: obviously, therefore, we can but call attention to his general plan, and cite a few specimens culled in different parts of the work.

In brief it may be said, this edition is encyclopædic in range, detail, and diffuseness. The professional annotator dreads nothing so much as to omit any references, however trivial, for which he may be accused of lack of thoroughness. Accordingly, Mr. Vernon, who is most thorough and conscientious, leans always towards giving too much rather than too little. He seems to have in view a reader who knows nothing about Dante, or Italian history, or ordinary literature, and to devote himself to the task of informing such a reader on all these themes. As a result, his volumes are an elaborate résumé of much that has been said about the "Inferno." The Dante scholar will find in them a mine of many metals, both precious and base; the novice will also find in them a clue to lead him through the labyrinth of allusions. We recall no other editor of a world's masterpiece who has so successfully suited his commentary to students of all grades.

Mr. Vernon's method is as follows: At the beginning of each canto he presents in small capitals the chief contents of the canto; next, in a page or two of large type, he shows its subdivisions; then, in fine type, he prints a few lines of the text; under this, in medium type, is an English paraphrase; then, in large type, he makes his comments; finally, in footnotes, he adds whatever collateral criticism he has not already supplied. This arrangement, speaking typographically, is far from satisfactory. The fragments of text are so small—mere acorns compared with the full-grown oaks of comment—that they are hard to find; especially when, as often happens, several pages of notes come between one *terzina* and the next. In our view, the original should be printed so that it could be read consecutively, even though this forced a large part of the notes back to an appendix. However excellent a commentary may be, it must be properly arranged—it must employ the best mechanical devices for catching the eye and holding the attention—in order that its excellence may not be wasted. Mr. Vernon, however, pursues the method of an expositor who, in reading the text aloud with a class, stops to criticise, or to answer questions, at every line, and takes no heed as to the length of his digressions. This method succeeds admirably in the class-room, as any one who had the privilege of reading Dante with Mr. Lowell can testify, but it has serious objections in a printed book.

Coming next to Mr. Vernon's translation, we must say that, while it is always intelligent, it is never striking. The great qualities of the original, its intensity, its brevity, its elisions, are lost through Mr. Vernon's purpose of making it, logically and syntactically, fair reading prose. He seems to take it for granted that the reader will be a person of no imagination, and he therefore inserts words or phrases to complete the sense. For instance, he translates the following lines:

> "E però nel secondo
> Giron convien che senza pro si penta
> Qualunque priva sè del vostro mondo" (xi., 41-43),

"and therefore in the second Round has to repent without avail (*i. e.*, without hope of redemption) every one who deprives himself of your world." We should suppose that any one capable of reading Dante at all would not require the explanation in parenthesis. Such dilutions are the necessary outcome of a solicitude to bring Dante within reach of the humblest understanding. Often, indeed, the interpolation is justified by the abstruseness of the text, but in a majority of cases it is superfluous. A single passage, and that the familiar story of Francesca, will illustrate sufficiently Mr. Vernon's ability as a translator:

"We were one day reading for pastime of Lancelot, how love enchained him. Alone were we, and without any fear of being surprised. Many a time that reading caused our eyes to meet, and our faces to change color; but one passage alone was it that overcame us. When we read how the smiling and longed-for lips (of Queen Guenevere) were kissed by so noble a lover, this one who never more shall be parted from me, all trembling kissed me on the mouth. Both the book and he who wrote it were a Gallehaut (*i. e.*, a go-between) to us. That day we read on no further" (v. 127–138).

It is unnecessary to point out how much Dante's incomparable lines have lost, through dilution and transposition of phrase, in this version.

But, after all, Mr. Vernon's intention is not to make a new translation which shall compete with Norton's or with Carlyle's, but to make an edition which shall surpass all other English editions of Dante in its notes; and herein he has succeeded. His patience and fidelity have allowed him to spare no investigation. He has put each word under the microscope of criticism, and has summoned Dantists of all ages—from Boccaccio and Benvenuto to Scartazzini—to corroborate or supplement the information which he has accumulated. How minute he is may be inferred from the fact that he takes three pages to prove that Latini and not Latino is the correct form of the surname of Dante's teacher. Sometimes we feel that he carries his painstaking too far, as where he subjoins a "grim diary" of Count Ugolino's death, viz.:

"*First day.* The prisoners hear the door being nailed up, and remain silent all that day and the following night. *Second day.* Ugolino, on the first appearance of dawn, is so horror-struck at the emaciated faces of his offspring that he gives way to a gesture of frenzy, which, being misunderstood by them, they offer themselves to him for food; whereupon he relapses into stony silence all that day. *Third day.* Silence and despair. *Fourth day.* Count Gaddo dies. *Fifth and Sixth days.* The other three die. *Seventh and Eighth days.* Count Ugolino gradually sinking crawls about, groping over the dead bodies, which he can only feel, but is unable to see. In vain he calls upon them to awake. His sufferings at length come to an end, and he breathes his last" (vol. ii., 641).

If any reader with a sense of humor should smile at this perfectly matter-of-fact treat-

ment of one of the supreme tragic episodes in literature, he would deserve sympathy. We have ourselves long stood ready to welcome a Society for the Prevention of the Desiccation of Masterpieces by Prosaic Commentators. And yet, since we have not space for citing the many instances where Mr. Vernon's elucidation is truly pertinent, we would not lay undue stress on his defects. "Leave something to the imagination" is a rule which annotators as well as realistic novelists should follow.

As was to be expected, Mr. Vernon pays close attention to the time references and the distances mentioned in the epic, with the hope of reducing them all to a consistent scheme. To follow Dante watch in one hand and tape-measure in the other has been a favorite amusement with a certain class of his critics. We know that he entered Limbo on Good Friday and emerged at the foot of the Mountain of Purgatory on Easter morning—having traversed a distance of several thousand miles through the interior of the Earth. As much of his journey was made on foot, and was interrupted by conversations with the damned, it is obvious that no rate of speed possible to terrestrial pedestrians can satisfactorily account for the distance traversed. Therefore, the present writer has always regarded the use of time-piece and tape-measure as futile. He has also deemed it quite as unimportant whether, at a given point, Dante turned to the right or the left, as whether, when Job sat down on his ash-heap, he faced east or west. Dante has succeeded in making every step of the journey described by him vivid: to dissect the process by which he has produced this illusion, to discover inconsistencies, to warn the reader that it would be humanly impossible to walk six or seven thousand miles in three days—even with an occasional Geryon-flight—seems to us to belong to the province of trivialities. However, in an encyclopædic work like Mr. Vernon's these matters may properly be mentioned, and he somewhat disarms our criticism by declaring that "the *Divina Commedia* is a vision, and allowance must therefore be made for the marvellous and the impossible."

His volumes are enriched by two steel engravings of the death mask of Dante; by pictures of the font in the Baptistery at Pisa, and of the Torre della Fame in 1507; by plans of the Wheel of Fortune and of the Broken Bridge in the Sixth Bolgia; by three different charts of the Dantesque Hell; by Rossini's music to Francesca's story, and by a map of Italy in Dante's time. The introduction contains short essays on the cosmography of Dante, on the symmetrical plan of the epic, on the data of the "Inferno" and its beauties, and on Dante's itinerary. There are also chronological tables and a bibliography. From all this it will be seen that he has gathered material indispensable to every English-speaking student of the 'Divine Comedy.' If we have given undue space to criticising the defects of his encyclopædic method, it is because we believe that it would be possible to present the same material much more compactly than he has done, and that, in these days of exorbitant annotation, brevity has become an unheeded virtue. Moreover, as he is engaged on a new edition of the "Purgatorio" and on an edition of the "Paradiso," he may be induced to practise restraint. His modesty, his fairness, his painstaking, and his enthusiasm entitle him to the esteem of every lover of Dante.

---

*Origins in Williamstown.* By Arthur Latham Perry, Professor of History and Political Economy in Williams College. Scribners.

Williamstown got its name in 1765, and the college that has done most to give the name renown was founded twenty-eight years later; yet in these six hundred substantial pages Prof. Perry gets only in sight of the latter event, and, indeed, devotes the bulk of his book to the time when the northwestern corner of Massachusetts was an Indian pass, then the site of Fort Massachusetts, and first settled as the town of West Hoosac. A treatment at once minute and discursive is required to expand the meagre tale into such ample proportions. All is fish that comes to Prof. Perry's net, and its cast is tremendous. It is only the severest self-restraint which keeps him from narrating the seven years' war at length, as he is fully conscious of its relation to the burning of the first Fort Massachusetts. But into other digressions he plunges, despite frequent apologies, with evident delight. One Indian foray suggests another, the architecture and remains of one fort lead on to comparisons with those of half-a-dozen others, and before one gets through he comes to feel that the history of the colonies and of a good part of Europe was somehow subtly determined in the valley of the Hoosac.

But the volume is by no means an example of pure antiquarian triviality. Antiquarian triviality, and whimsicality, antiquarian or other, it contains in plenty, but withal it yields the peaceable fruits of solid research continued through forty years of enthusiastic devotion to town and college. The note of personal loyalty and championship is, in truth, prominent throughout. The north line of western Massachusetts was ordered by the Privy Council in 1740 to be run "due west" from Pawtucket Falls. But "Hazen's line," run the next year, held really 1° 45′ north of west, thus saving to Williamstown about one-third of its area, which would have gone to Vermont. With a turn worthy of Thomas Fuller, Prof. Perry speaks of this as "a blessed error of the compass." So, later on, when a citizen farmer drifted away from the town and out of this history in search of richer fields, the author, with an unwavering loyalty which is enough to put Judge Nott with his abandoned farms to shame, professes to be quite at a loss to account for the man's dissatisfaction with his perpendicular Williamstown acres. On the situation and picturesque glories of the town he wreaks himself in lover-like fashion for sixty-eight pages, and can pay no higher compliment to his dearest friend than to give his name to some unpreëmpted rock or point.

The main historical value of the book consists in its full story of the strategic position of the Hoosac Valley in relation to the French and Indians on the north and the Dutch on the west, and in its collection of every scrap of evidence bearing on the personality and family of Col. Ephraim Williams, commander of Fort Massachusetts, leader of the Massachusetts men in the Lake George expedition, and founder (by will) of the college. College-founding seems to have run in the blood, as his cousin, Israel Williams, "the monarch of Hampshire," got a charter from Gov. Bernard in 1762 for "Queen's College," to be located in Northampton, Hatfield, or Hadley. Israel's motives were not unmixed benevolence, as he was miffed at Harvard for having printed his son's name too far down the social scale in the catalogue. But the Harvard lobbyists of the day were too much for him, and got the Governor to invalidate the charter; all which did not prevent the tradition of there having once been a "Queen's College" in Hatfield. A nonogenarian resident of that town vehemently assured Prof. Perry in 1880: "There used to be a college here, and I have seen it myself." The history of the college that a Williams succeeded in founding, Prof. Perry proposes to write in a volume to follow.

---

*Basal Concepts in Philosophy.* By Alexander T. Ormond, Professor in Princeton. Scribners. 1894.

The purpose of this work is to propose a certain modification of the Hegelian system, suggested by studies in philosophical theology. The modification cuts pretty deep, being no less than the identification of Being and Spirit, two of the primary categories of the Hegelian logic. It is to be accomplished by some alteration of the Hegelian dialectic which is not by any means rendered clear, far less justified. In fact, clearness and conclusiveness are the two qualities this book can boast the least. An ordinary person, should he be condemned to read it, might fancy he caught a glimpse of meaning here and there; but one who has devoted a year or two to the study of philosophy, upon a modern method, will find it utterly unprofitable. An accomplished thinker may make some little use of the work, notwithstanding its grievous faults of logic.

Attempts to reform Hegelianism ought to be encouraged and treated benevolently. All things are to be known by their fruits; and certainly never idea had a fairer, fuller trial than the Hegelian system. All Germany went into it for a generation, and the fruit was disappointment and disgust. How could trial be fairer? And if any question is ever to be regarded as pretty nearly set at rest—set at rest until some very unexpected new evidence presents itself—must not this question be so regarded among the first?

At the same time, very few minds that have examined the matter with attention look upon Hegelianism with exactly the same eyes as upon astrology, or even as the majority of the very small number of persons who have conscientiously examined the evidence about ghosts look upon that belief. On the contrary, although historic experience condemns Hegelianism as a method and a ruling tendency, it does go to show that where Hegelianism, while having a certain influence, has not been strong enough to turn men from common-sense humility in regard to external nature, its influence has many a time been beneficial. So it is probably safe to say that the indefinite congeries of minds that partake of the real spirit of investigating science (not mere readers of scientific results), but at the same time are well versed in the world's philosophical thought, are inclined to think that Hegelianism, however wrong on the whole, yet contains something not without value if it could be singled out. It is easy enough to point at elements of the position of Hegelians and other metaphysicians that are quite irreconcilable with the position of scientific men. All scientific men (except some pure mathematicians) have a very unaffected reverence for nature—so genuine, indeed, that it is often subconscious—which causes them to surrender their dearest beliefs at nature's best. But the idealists, as a body, as well as some other metaphysicians, look upon things external with a sort of contemptuous disdain, and regard nature as rather a bore. This self-poise deprives them of the only means whereby they could

proceed from falsehood to truth. As long as philosophers are bred in seminaries where any species of infallibilism is taught, or imitate others so bred, such will be the main result. Theirs will be systems founded on egotism, embodying whims of more or less artistic symmetry, but destitute of the power of growth. On the other hand, it is not difficult to indicate general features of Hegelianism in respect to which it harmonizes better with the general principles of science than do most of the other philosophical systems. Here there seem to be ideas of real power. Here is something which in time must grow and choke the parasitical errors of the system. The difficulty is to give the thing the first start. Whether that can be done by any attempt to improve the agreement of Hegelianism with theology (such is the aim of this volume), may very well be doubted. We should be more inclined to look for the first buds of regenerate Hegelian life on such a tree as that of Mr. Ritchie, the author of 'Darwin and Hegel.'

We shall not advise many of our readers to try to solace their leisure by reading Prof. Ormond's not too perspicacious, nor too vigorous, nor too agreeably written volume. Two things are specially urged in it which may make some persons curious to look over the work—one the idea that personality is essential to being, the other that Nothingness has a sort of reality. We simply mention these, without saying that we think they are skilfully defended.

---

*Roger Williams:* The Pioneer of Religious Liberty. By Oscar S. Straus, author of 'The Origin of the Republican Form of Government in the United States.' The Century Co. 1894. Pp. xvii, 257.

THE appearance of this biography of one of the strictest of the New England Independents, from the pen of one who bears a name that links him to another race than that of New England, is a testimony to the wide sympathy characteristic of modern scholarship. Mr. Straus has diligently gathered the biographical facts regarding the founder of Providence, and has presented them in a simple and readable narrative, constituting a small volume of rare excellence of typography, and warmly eulogistic of its subject.

It has been the fate of Williams, beyond that of any other of the founders of New England, to be treated from diametrically opposing points of view, and this contrariety is nowhere more apparent than in the story of the crucial episode of his checkered experience—his banishment from Massachusetts. Though the opposing historians have not always come from the respective States, there has arisen regarding Williams what may be called in general a Massachusetts and a Rhode Island school of interpretation—the one dwelling on the political causes of his banishment, the other representing him as primarily a martyr to freedom of conscience. Mr. Straus belongs to the latter, holding that "the cause of his banishment" lay in his maintenance that the "civil power has no jurisdiction over conscience"; and Mr. Straus finds in this principle the motive of about all that Williams did.

Something of this divided point of view is due to the peculiar combination of qualities in Williams himself—a combination which seems to a modern mind almost a contradiction. Like Robert Browne, whom he in many ways resembled, but who, unlike Williams, became outwardly reconciled to the party he opposed, Williams combined an ultra-Separatist hostility to the Church of England with the doctrine of the non-interference of the civil powers in matters of conscience. On the one hand, Browne and Williams were narrow in their sympathies to a degree which cost them the good-will of the great Puritan party, and which made their ministry everywhere divisive by reason of its opinionativeness; on the other hand, they were in advance of their times in perceiving the proper line of demarcation between Church and State.

From a modern standpoint, or even from the point of view of the discussions over toleration in England after the Westminster Assembly had begun its work, Williams stands forth most conspicuously for his doctrine of "soul-liberty." But it may well be questioned whether that appeared his most conspicuous tenet to the Massachusetts men of 1631–35 who banished him from their jurisdiction. That trait was indeed recognized; but in the speech, quoted by Mr. Straus, in which Gov. Haynes enumerated Williams's offences and spoke his sentence, and of which Williams, who reported it, affirmed, "I acknowledge the particulars were rightly summed up," the limitation of the authority of magistrates to civil affairs is placed last, and Williams's attack upon the patent, upon the oath, and upon the lawfulness of hearing ministers of the Church of England are all given precedence. There is every reason to believe that the Governor's speech represented the case as it lay in the minds of Massachusetts men at the time of Williams's banishment. Their charter was in danger of English attack, they had tried to strengthen their threatened commonwealth by an oath, they were not willing (in general) to regard their English compatriots as in an anti-Christian state; and Williams's opposition to the views of his fellow-countrymen on these points was, to their thinking, fully as dangerous as his doctrine of soul-liberty. It was quite as much, if not more, the cause of his banishment. The chief fault of Mr. Straus's book is that he fails to give due weight to these facts and others like them. He has judged Williams's relations to the men of his age by what posterity finds most valuable in his teaching, rather than by what actually appeared most conspicuous to his contemporaries of 1635. With all his carefulness of biographic detail, Mr. Straus's book produces the impression of a eulogy of an ideal, rather than of a full-rounded picture of the actual, man.

Mr. Straus agrees with Mr. Waters in holding that Williams was a Londoner by birth, but the year of his nativity he would fix as 1607, on the ground that Williams could not have become a scholar of the Charterhouse School, as he did in June, 1621, if over fourteen years of age at that time. To sustain this view, Mr. Straus gives what certainly seems a strained interpretation to Williams's own statements regarding his age; and while his theory may be correct, the query may properly be raised whether the rules of the Charterhouse were so strict as to prevent the admission of a protégé of its powerful benefactor, Sir Edward Coke, even if over the customary age. Certainly he was an exceedingly youthful reporter if the short-hand notes of "Sermons and Speeches in the Star Chamber" which won him Coke's attention were taken before he was fourteen.

*Suicide and Insanity:* A Physiological and Sociological Study. By S. A. K. Strahan, M.D., Barrister-at-Law. London: Swan Sonnenschein & Co.

UNLESS bound very closely to the world of matter, a man wakeful in the stillness of the night is apt to ponder upon Sleep's elder sister. One listening to the first wail of life has a curious longing to know more of the other world from which the spark of vitality has floated. When a full flame goes out as the new spark kindles, it is a double mystery. Who sees a strong man transformed into insensitive flesh, as in his responsible and responsive capacity he disappears from our association before the point of a dagger, or a few grains of poison, and who watches the helpless and hopeless invalid keep his own flickering ray unextinguished, must ache, if he has any thought, to solve the principles, if there be such, underlying this paradox. What is beyond, and how it comes into relation with us, whether an abyss of gloom, a cloudless realm of happiness, or the negative repose of nirvana, has both attraction and repulsion, like the qualities of electricity, for the incorporeal element that believes itself immortal. But this possible immortality is reached only through the portal of a positive death. May a man from curiosity, from principle, or from despair, lay aside at his own pleasure the mortal robe that at once masks and gives identity to the lighter essence? The robe being drawn aside by necessity, or thrown off by caprice, is the spirit volatilized, or may its individuality be preserved? Does a Higher Power resent the intrusion of the immortal part unsummoned by an agent foreign to itself? Does voluntary departure from this life place the soul in jeopardy? May a man in the full exercise of his reason close upon himself the irrevocable door that shuts out the light of this world? Does not suicide, *ipso facto*, proclaim mental unsoundness? Queries dense as a Norway forest at once receive and bewilder the inquirer who steps out of the beaten path worn by the unreasoning multitude.

Every suicidal act is rational or irrational in its essence. It is begging the question to stamp suicide with the seal of insanity. To soothe the feelings of survivors to whom suicide is equivalent to murder, or because in their eyes life is so precious that its voluntary renunciation is inconceivable, juries of inquest almost invariably append "while temporarily insane" to a verdict of suicide. This may be a relic of the age when self-destruction carried with it spiritual and temporal penalties. It is a nice question how far sound judgment may overcome instinctive love of life, how far that love may be set aside by reason. "The first law of nature" is a phrase, not a fact; or, if a fact, it may receive its justification in its apparent violation. The man who evades the torture of fatal fire by leaping to certain death a hundred feet below, is not called a suicide. Would it be more suicidal to drive a dagger into his own heart as the flames seize his final refuge in the burning tower? Does the white man who uses his last shot to avoid the deadly torture that a savage foe invariably inflicts, commit suicide any more really than in expending that shot to reduce those swarming enemies by one? Abruptness is no necessary element of self-destruction. Is Father Damien giving up his life by a continous surrender to the claims of leprosy; is the martyr who obstinately, or heroically, refuses allegiance to a heterodox doctrine while judicial death lies awaiting his decision; is any saviour of a helpless individual or of a race, who, by a sudden impulse or by deliberate principle, sacrifices himself that others may live, a suicide? That the suicidal act is not literally self-inflicted does not destroy its essential character. He who plots

against himself so that a friend who believes he is using blank cartridges actually shoots him, is the real actor in the tragedy. The Curtius who leaps into the chasm to save Rome, the rear-guard that by its own destruction allows the main body to escape, the Winkelried who harvests a sheaf of Austrian spears, are virtual suicides; but by all human standards they are heroes.

The motive through which life is relinquished determines the quality of the act. That is to say, the exchange of an individual life for the sake of another or of a principle is not true suicide. It may be a useless sacrifice, but in its essence it has nothing in common with self-destruction where attainment is its own ultimate aim. This true suicide is irrational, and is divided into that where there is distinct insanity, where there is an uncontrollable impulse in that particular direction closely akin to insanity, and where the mental balance is so easily disturbed as to bring this impulse into existence by a shock or a strain. These really are variants of the one condition.

It is to the conditions leading to true suicide that the interesting book before us is chiefly given up. The perfectly sound conclusion is reached that irrational suicide is usually the outcome of mental deterioration which either has been inherited or has been developed by indulgence in vice. This last also frequently means continuous mental as well as moral deterioration; and the cultivation of the unfit by modern society, the breeding into damaged stock, generates offspring more and more impelled to go wrong. The irrational suicide is not necessarily a lunatic in other ways, but his family chain before and after him usually has many ill-forged links. The benevolence of the era, keeping alive the mental and moral cripples that natural selection would eliminate, has much to do with this offence against nature. The moral, the legal, and the sociological aspects of suicide are intelligently discussed in this volume, whose main conclusions are given above.

---

*A Manual of the Study of Documents* to establish the individual character of Handwriting and to detect Fraud and Forgery, including several new methods of research. By Persifor Frazer, Docteur ès sciences naturelles, Officier de l'instruction publique (France), Correspondant der k. k. Reichsanstalt zu Wien, etc. Philadelphia: J. B. Lippincott Co. 1894. Illustrated.

THIS book is unfortunate in its abbreviated title, 'A Manual of the Study of Documents,' which conveys little idea of the contents. The author says in his introduction that, owing to his "inability to find a less pretentious title for this little work, he has ventured to call it a manual or handbcok," and it certainly is a most complete handbook of the subject as set forth in the title-page. It is made more useful than very many of its class by an unusually full index, enabling the reader to refer to the minutest matter upon which he wishes to refresh his memory. Every point bearing upon the detection of forgery appears to be covered, from the character of writing as affected by the position of the arm, to the depth and width of the furrows in the paper made by different pens, and the most minute examination and tests of ink. Methods of detecting erasures made by scraping, rubbing, or washing are enlarged upon; and a chapter devoted to the "Hesitation and Tremor of Feebleness, Illiteracy and Fraud" is well worth careful study. Figures and photographic plates illustrating the points dwelt upon greatly help the text. A chapter "Concerning the Laws relating to the Testimony of Experts on Handwriting" contains an extract from Stephen's 'Law of Evidence,' some decisions, and reference to nearly one hundred others. Incidentally, much information is given in regard to paper, ink, and composite photography, and recording-officers or persons drawing wills or documents intended to be permanent will find valuable information in the few pages devoted to characteristics and the testing of ink. Altogether the book is a most valuable one for all who have to do with mercantile paper or legal documents, and cannot fail to interest any one who desires to extend his general information.

BOOKS OF THE WEEK.

Baker, W. M. The New Timothy. Harpers. 50 cents.
Campbell-Praed, Mrs. Outlaw and Lawmaker. Appletons. $1.
Dostoievsky, F. Poor Folk. London: Mathews & Lane; Boston: Roberts Bros. $1.
François, Gustave. Le Commerce. [La Vie Nationale.] Paris: Léon Chailley.
Gautier, Judith. Iskender. [Bibliothèque de Romans Historiques.] Paris: Colin & Cie.
Hall, J. L. Judas: A Drama. Williamsburg, Va.: H. T. Jones. 50 cents.
Koegel, Prof. Rudolf. Geschichte der Deutschen Litteratur bis zum Ausgange des Mittelalters. Erster Band, Erster Teil. Strassburg: Karl J. Trübner.
Lilly, W. S. The Claims of Christianity. Appletons.
Méneval, Baron Claude-François de. Memoirs Illustrating the History of Napoleon I. from 1802 to 1815. Vol. I. Appletons.

"Ay, four in buckram suits."—*Henry IV., II.*, 4.
SMALL 16mo, BUCKRAM, WITH FRONTISPIECES, 75c. EACH.
*Just Published. Mrs. S. M. H. Gardner's*
QUAKER IDYLS.
Delicate and sympathetic character sketching is the principal but not the sole attraction of these tales. They are pervaded by a subtle humor, and any monotony is avoided by the introduction of the dramatic "fugitive slave" trial and the amusing incidents of the Quaker girl's plunge into the comparative gayety of Boston and the society of Harvard students.
*Third American, Third English Edition of*
Anthony Hope's Prisoner of ZENDA.
"A glorious story, which cannot be too warmly recommended."—*Critic.*
"The dash and galloping excitement of this rattling story."—*London Punch.*
*Henry A. Beers's American Tales.*
A SUBURBAN PASTORAL.
"No collection of short stories by an American writer, lately published, has made a more entertaining book."—*N. Y. Times.*
"Writing which is permeated with delicate fancy."—*Life.*
"We shall remember him among the sweetest, tenderest, and gravest of our story-tellers."—*Mail and Express.*
*Second Edition of Jerome K. Jerome's Love-tragedy of Old London, and four Tales.*
JOHN INGERFIELD.
"It is a good thing to write an honest, wholesome, old-fashioned love-story like 'John Ingerfield.'"—*N. Y. Times.*

# The Nation.

*NEW YORK, THURSDAY, JULY 19, 1894.*

## The Week.

THE collapse of the strike is not the most important development of the week. Transcending this in significance is the demonstration that such a strike can never again be so formidable in this country. The issue has been made in the sharpest possible way. As Senator Platt of Connecticut said, in his admirable little speech sustaining Mr. Cleveland's course:

"Mr. President, we are confronted with one supreme question, and that is, Who is President of the United States, and whether we have any United States? The question is, whether the person whom we elected to be our chief executive is the chief executive of the United States, or whether the man who calls himself President Debs is the President and chief executive of the United States."

It is now universally recognized that such a strike as Debs ordered is a rebellion, and that the people of the United States will promptly suppress rebellion. There will always be men like Debs, greedy of notoriety and crazy to show their power, but this country "will not stand any nonsense" from such people in future. The next upstart who orders the laboring men of the land to make a national boycott will fare about the same way as a man down South who should propose that his section secede from the Union.

---

The prompt indictment of Debs by the federal grand jury, and his equally prompt arrest, lost something of their force through his securing bail and through his trial being put off till October. This, however, is but a necessary result of the careful protection which the law throws about the rights of accused persons. Still, the fact of the arrest of the head conspirators, the swift measures taken to collect overwhelming evidence against them, and the practical certainty that they will be convicted in due time, with a possible sentence to follow of $5,000 fine and imprisonment at hard labor for six months, could but have an immediate and powerful effect. Debs under indictment and in the shadow of the prison could not palm himself off as a Dictator much longer. Dictators who are dictated to by judge and jury have something hollow about them. Not even a Populist Governor will be so poor as to do such a Dictator reverence. In short, the demonstration that there is still a court, and that its process can run even in the awful presence of Debs, serves the great purpose of reducing him to the ranks of mortal men. Once seen to be there, he can no more wear his Olympian dignity with such éclat.

The uncompromising endorsement of the President which was given by the Senate on Wednesday week is something almost unprecedented. Such flat-footed utterances are seldom to be had from any political body. The usual thing is such a good-Lord good-Devil deliverance as that of the Minnesota Republicans on the same day, condemning the "wanton destruction of property" and calling for the "suppression of mob violence at all hazards," but also favoring "such legislation" as will compel employers to arbitrate their differences, whether they want to or not. A similar nullifying amendment was urged in the Senate to Mr. Daniel's original resolution, but, strange to say, it was voted down by a large majority. For this result thanks are due to the vigorous stand of Senator Platt of Connecticut, who, insisting that the only issue before the Senate was whether Debs or the President was the chief executive of this nation, protested against letting in anything about arbitration at all. This view prevailed, even Senator Sherman standing up squarely for approval of the President and condemnation of the mob.

---

Senator Sherman suffered the full penalty for his recent astonishing utterances in regard to the Pullman boycott when, on Tuesday week, Peffer took him to his bosom, with tears of joy and surprise, as an ally. "I was delighted, as well as surprised, the other day," said Peffer, "at the distinguished Senator from Ohio (Mr. Sherman) offering a resolution for Congress to overhaul the Pullman-car business. I was surprised and delighted at such a resolution coming from such a source at such a time." The sane and orderly portion of the public was also surprised at "such a resolution coming from such a source," but no one except Peffer has expressed delight over it. It is no slight calamity for a statesman with a reputation for intelligence to have Peffer approach him with extended arms and protestations of affection, and there are few Senators who would not flee at the first sign of such an embrace. While there may be some sympathy for Mr. Sherman in the disaster that has thus befallen him, nobody can say that he has been punished beyond his deserts. He took his position with full knowledge of what he was doing, and if he finds himself standing in the Senate alone with Peffer, at the moment when other Senators are vying with each other in indignant denunciation of Peffer's incendiary ranting, he has only himself to blame.

---

The House will not win a reputation for vigor and courage by going valiantly to war after peace has been declared. Its resolution of Monday endorsing the action of the President in putting down mob violence would have done a great deal of good if adopted a fortnight ago. When the crisis was actually on, the House was silent as the grave, and the members were saying to the reporters, "For Heaven's sake don't interview us on this question." They were filled then with the cowardice of their own lack of convictions. Now that the battle has been won, they discover that they were mighty men of valor all the while, and that it was simply an oversight which had prevented them from lifting up their voices before. The President and the country would have been helped by a strong deliverance from Congress when the emergency was upon us; now that it is past, no one will have any feeling but amused contempt for a House that falls a-fighting a fortnight too late.

---

The men who have been burning cars, wrecking locomotives, and destroying other railroad property in Chicago doubtless suppose the railroads will suffer all the loss thus caused. In point of fact, the city of Chicago will have to pay the greater part of the bills. A law passed by the Illinois Legislature a few years ago provides that whenever any building or property is destroyed or injured by a mob or riot, the city shall be liable for three-fourths of the damage thereby caused. This means that taxes must be heavier in Chicago because of the Debs riots, and the greater the damage to railroad property, the heavier the ultimate loss which must be paid by the workingmen in the shape of higher rent to cover the increase in taxes.

---

Utah is to be a State, both branches of Congress having agreed upon a bill which the President has signed. So far as population goes, Utah was entitled to admission, for the inhabitants numbered 207,905 in 1890, and there is a steady growth from year to year, which will doubtless carry the number up to a quarter of a million by the time all the formalities are completed in 1895. The fear that polygamy might be revived after the Territory became a State, and that there would then be no effective way for federal authority to deal with it, has gradually died out. Mormons themselves give the warmest approval to the later "revelation," which has practically annulled polygamy as a doctrine of the Church; and even the social line which a few years ago so distinctively separated Mormon and Gentile in Utah has disappeared. The only cause for regret about the admission of Utah is the fact that it was not annexed to Nevada and the two

made one State. This were practicable now, but it will be next to impossible hereafter. As it is, the problem of the sage-brush State, with its petty population constantly dwindling, remains apparently insoluble.

---

Some Republican organs in the East are evidently puzzled that their party in Congress has not opposed the admission of Utah, or made more than a pretence of antagonism to the scheme for letting in New Mexico also, with its large element of ignorant voters. The explanation is, that the managers in Washington are very hopeful of carrying both of the new States in their first elections, and thus getting four additional Senators on their side. In 1892 the Republican candidate for Delegate in Congress was beaten in New Mexico by only 579 votes in a total of 31,019, and in Utah the Republicans polled 12,390 votes against 15,201 for the Democrats, with 6,986 for a "Liberal" candidate, while since then the Mormons have been beaten for the first time in a municipal election at Salt Lake City. The silver policy of the Cleveland administration is extremely unpopular in these Territories, and the Republicans hope to profit by this feeling. It is undoubtedly for the sake of helping their chances in these remote regions that the party managers are letting down their standard on all financial questions, and causing the adoption of the extraordinary silver platforms which amaze conservative members of the party in the East.

---

One of the most flagitious changes made by the Senate in the tariff bill was in raising the duty on lace curtains to 50 per cent. These are made of cotton, and, being cheap and attractive to the eye, are in general use throughout the country. Under the tariff of 1883 they were subject to a duty of 40 per cent. McKinley, in a spirit of liberality with other people's money, raised it to 60 per cent. The Wilson bill put it back to 40 per cent., but ought to have put it lower. In point of fact, the largest manufacturer of lace curtains in this country, Mr. Clarence Whitman, of the Wilkesbarre Manufacturing Co., has testified more than once that 35 per cent. is ample, and that anything beyond that is a sheer gratuity. It should be added that the duty on cotton yarn, the raw material of this industry, is *reduced* in the present bill by 40 per cent., to which, of course, there is no objection. Notwithstanding all this, the Senate committee, at the instance of one prosperous and one bankrupt concern (there being only two in addition to the Whitman factory), has raised the duty to 50 per cent. We understand that the leading houses in the trade in this city have remonstrated strongly against this outrage, and we hope that the House will stand firm on this paragraph of the bill.

---

It is as gratifying as it is surprising to be able to record a bit of Congressional legislation affecting offices proposed and passed purely as a business measure. We refer to the reorganization of the Treasury Department, which was ordered by the Senate on Saturday as an amendment to the legislative appropriation bill. This measure was reported by the joint committee on the laws organizing the executive departments, and was advocated in the House by the best men of business in both parties. It provides for sweeping away a great many antiquated and cumbrous methods in the keeping of the Treasury accounts, and for introducing the simplicity and accuracy of modern book-keeping. Incidentally it proposes to cut down the accounting force of the Treasury, to the annual saving of no less than $200,000. To get such a bill through Congress is a tremendous feat. It was inevitable that a great many members who saw $200,000 worth of offices cut off from their possible perquisites should have grave doubts about interfering with the work of the fathers, and should develop a sudden anxiety about the checking off of one man's accounts by a dozen others. But Messrs. Dingley and Dockery in the House and Senators Cockrell and Proctor in the upper chamber met all objections raised so conclusively that Senator Sherman, who set up his authority against the recommendations of both the present and the preceding secretary of the treasury, could rally only four forlorn votes against the bill. All this augurs well for further reforms in future Congresses, at the instance of the joint committee.

---

A member of Congress from Illinois, on the Democratic side, has introduced a bill to make gold contracts payable in silver, or greenbacks, or leather, or mud, or anything which Congress has made or shall make legal tender. A movement of this kind was sure to come sooner or later. Thomas Paine, in view of the catastrophe of the Continental currency, declared solemnly that anybody who should propose another legal-tender act ought to be put to death. The words of this apostle of democracy cannot be quoted too often. They are contained in his "Dissertations on Government," vol. i., p. 407, thus:

> "The laws of a country ought to be the standard of equity, and calculated to impress on the minds of the people the moral as well as the legal obligations of political justice. But tender laws of any kind operate to destroy morality and to dissolve by the pretence of law what it ought to be the principle of law to support, reciprocal justice between man and man; *and the punishment of a member who should move for such a law ought to be death.*"

If that ought to be the punishment of a member of Congress who should move for a law making irredeemable paper legal tender, what should be done to one who would make specific gold contracts payable in such paper? Is there anything of liberty left when a man's right to make a contract is taken away? Not a shred. The Constitution was framed and adopted to establish justice. When this fundamental idea is abrogated, the Union is no longer worth preserving and will not long survive.

---

Congressman Patterson of Tennessee, who voted against the majority of his colleagues from that State for the repeal of the Sherman law, and who opposed the proposition for free-silver coinage, has written an admirable open letter to his constituents regarding his course in the present Congress and his attitude in case of reëlection. In 1890 Mr. Patterson advocated free coinage, but that was when silver had temporarily run up as high as $1.20 per ounce, and when he had not given the subject careful study and reflection. Since then he has made such investigation of the questions involved that he is now thoroughly convinced of the danger involved in that policy. Mr. Patterson presents cogently and forcibly the considerations which have caused him to change his opinion, and his arguments are unanswerable. The frankness with which he meets the charge of inconsistency must disarm all candid critics. Indeed, his letter cannot fail to carry great weight with any man who is open to conviction. It is precisely the sort of communication which a Representative in Congress ought to address to his constituents when any difference arises between them, and it would be a good thing for the country if such open letters were more common.

---

The conclusion of Mr. Patterson's appeal applies as well to all Southern districts as to his own, since it shows the peculiarly great advantage which the South could now reap from assuming a sound position on financial questions. He calls attention to the fact, which is now universally conceded, that the South has weathered the hard times with fewer failures, less bankruptcy, and more comfort than any other section. He points out that Coxey's Army secured no recruits from the South, that there have been no public soup-houses, no organized opposition to social order, and no seizure of property by mobs. He says that the tide of immigration westward has now crossed the continent, and that there is much disappointment with conditions in the far West. With a salubrious climate, a fertile soil, great variety of productions, and marvellous resources, the Southern people are now, in his opinion, "approaching a great opportunity."

All that is necessary to improve the opportunity and enjoy great prosperity is to "bring the South into closer political and commercial relations with that great and controlling section—controlling alike in wealth and population—which lies north of the Potomac and Ohio Rivers and east of the Missouri"; and the surest path to this end is by supporting a sound financial policy. It would be hard to exaggerate the force of this argument.

---

The deal between Platt and Tammany is clearly exposed by Mayor Gilroy's appointment, as Police-Commissioner McClave's successor, of Gen. Michael Kerwin, one of Platt's most faithful followers. The selection is grossly unfit in itself, Kerwin being a professional politician of the worst type, who has a poor reputation and was once discharged from a place in the post-office because he neglected Government work for wire-pulling. He represents the Milholland machine in local Republican politics, and was lobbying in its interest before the Legislature during the recent session. In short, he is a perfect type of the man who ought *not* to be appointed to a responsible place in the municipal government. Tammany picks him out because he is a Tammany Republican who can be trusted to do his best to keep Tammany in power by supporting the straight-ticket policy in the approaching city election. His appointment is an outrage on the public and an insult to decent Republicans which they ought to have spirit enough to resent. They see now exactly what the advocacy of a straight ticket means—a trade with Tammany every time there is a chance, and a sacrifice of the public interests to the aggrandizement of a few professional politicians. The straight-ticket men have no expectation of electing their own ticket—and if they could, what better would a Platt-Milholland administration be than a Tammany one? What they do expect is, by helping Tammany to retain control of the city, to capture a lot of fat offices for themselves. That is "what they are in politics for." The question is whether the Republican party will be run by this gang.

---

By the death of Gen. James B. Fry the country loses one of the most useful, although not one of the most famous, men of the war period. After a service in the field which included the battles of Bull Run, Shiloh, Corinth, and Perryville, Gen. Fry was assigned to duty as provost-marshal-general of the War Department, having charge of enlistments, conscription, and draft. In this capacity he rendered important and indispensable services, but they were not of the kind which attract attention like exploits on the field of battle. It was in the course of his duties as provost-marshal-general that the conflict between Blaine and Conkling took place over his head, although this event happened a year after the war and while Gen. Fry was winding up the affairs of the office. This controversy, which had the serious consequence of dividing the Republican party into two very hostile factions, grew out of a charge made by Mr. Conkling in the House on the 24th of April, 1866, that certain men who had "stood up honestly and attempted to resist bounty-jumpers were stricken down and trodden under foot by Gen. Fry." Mr. Conkling added: "The only way to acquit him of venality is to convict him of the most incredible incompetency." To this attack Mr. Blaine replied in a few peppery remarks, which drew from Mr. Conkling the answer that what Mr. Blaine said was false. For this he was called to order by Mr. Blaine, who made the point that such words were unparliamentary, and the point was sustained by the chair.

---

A few days later Gen. Fry wrote a letter to Mr. Blaine which the latter caused to be read from the clerk's desk. Mr. Conkling had been acting as judge-advocate in the military service at the time when the acts that he condemned had been committed. Gen. Fry now made the point that if he knew the things that he pretended to know, he ought to have made formal charges against him. He concluded his letter by saying: "He (Conkling), therefore, can only escape the charge of deliberate and malignant falsehood as a member of Congress by confessing an unpardonable breach of duty as judge-advocate." These words were probably inserted in the letter at Mr. Blaine's instance. Gen. Fry, in publishing a review of the whole matter last year, remarked that he submitted the letter to Mr. Blaine before sending it, "by whose advice some of the expressions were sharpened." This letter led to the rancorous debate in the House in the course of which Mr. Blaine compared Mr. Conkling to Thersites, to a turkey-gobbler, a singed cat, a whining puppy, and made various other galling allusions which the gentleman from New York was the last person in the world to forget or forgive. Gradually Gen. Fry passed out of view as a party to the controversy, which continued to rage as long as Mr. Conkling lived. It is very clear now that it was a case of misunderstanding as between Conkling and Fry, for the latter tells us in his book that he afterwards met Conkling at the house of Gen. Grant in 1883, and that they shook hands on that occasion twice and parted amicably. Gen. Fry was the soul of honor. He would sooner have plucked out both his eyes than defraud the Government, or allow it to be defrauded with his knowledge or privity.

---

New difficulties growing out of the internationality of silver coins in the Latin Union are constantly cropping up. Under the treaty of 1865 a standard of weight, fineness, and diameter was fixed for all the minor coins. The old coins, varying from this standard, were allowed to circulate in all the countries of the Union till January 1, 1869, and no longer, being legal tender for fifty francs in one payment. Of course the public paid very little attention to dates and minute variations from the standard. Consequently the small coins of Italy of all dates and sizes flowed into France, where they have become a common nuisance. The law requires that when any bad or uncurrent money is offered for deposit at the Bank of France, the receiving teller shall cut it in half and return the parts to the depositor. A silver coin so cut loses one-half of its trading value. Much bad feeling has been engendered in this way. Moreover, it is found that many Italian silver coins of full weight dated 1886 and 1888 are circulating in France. As the Italian Government did not coin any silver in those years, it follows that these are counterfeits. Of course the Italian Government refuses to redeem them. The upshot of the whole matter is, that the Latin Union is becoming very unpopular in France, and the cause of international bimetallism suffers equally.

---

The Berlin socialists are evidently sincere. A dispute having arisen between the great brewers of that city and their employees, the socialists took a hand in it by ordering a "boycott" of the places where the product of these breweries was sold. This game, however, is one that two can play at, for the keepers of the drinking-places have closed their houses to all socialist meetings until the boycott is removed, and the great breweries have pledged themselves to supply no more beer to any places where such meetings are held. The socialists thus appear to have adopted a "self-denying ordinance" of great severity. To be deprived of both beer and meetings must be to them an unexampled hardship. For some weeks they have been leading a precarious existence upon soda-water, "ginger-ale," and other "temperance drinks," with the consequences to be apprehended from such dangerous violations of the laws of health. It is scarcely necessary to say that it is impossible to maintain any revolutionary fervor upon a diet like this, which certainly has nothing "hot and rebellious" in its character; and the cause of socialism is likely to suffer a decline unless this injudicious boycott is removed. There are limits to human endurance even in the most sacred of causes.

*A LESSON IN PATRIOTISM.*

THERE is no room to doubt that the patriotic sentiment of the American people has been powerfully stirred during the last two weeks. More than one judicious man has been heard to say that nothing like it has been seen since the civil war. It has been no mere newspaper flurry. All classes in society have been touched, and all parts of the country aroused. Men who are too young to have known the fervid national emotion which swept over the North in 1861, have for the first time had their pulses quickened by the feeling that there was something inspiring and majestic in the idea of a national authority which it would be good to spend strength and life in defending. For most men under forty, in fact, the recent revival of national sentiment has been the greatest lesson they have ever had in genuine patriotism.

This waking of the patriotic spirit is all the more gratifying because it was so unexpected. As so many times before, the people of this country have shown that they are very patient and often dangerously good-humored and long-suffering, but that there is a point beyond which the traitor or the demagogue who presumes upon their indifference, goes at his peril. No one forecast this outburst of national feeling against rebellious boycotters, any more than the similar and greater outburst against rebellious slaveholders was anticipated. Up to the very moment of its appearance, so astute and old a politician as Senator Sherman suspected nothing of the coming deluge, and was caught full in its track, just as the doughfaces of 1861 were caught in the flood which took them unawares. A good part of the praise due to the President for his prompt and resolute action is for acting before public opinion had certainly declared itself. He stood up squarely for the assertion of the national authority before he or anybody else could be sure that the support and applause of the country would be so speedily given him. But when the critical time came, the response of the nation was swift and unmistakable. It was that, and not the handful of troops at the disposal of the authorities, which quelled and conquered the frenzied mob. It was an encouraging demonstration that American patriotism may still be counted upon in times of national peril.

But still more reassuring is the form and direction taken by this aroused sentiment of nationality. It overrode all partisan distinctions, to begin with, and for a brief but blessed season silenced the ignoble voices which are so quick to proclaim that there are votes or party advantage to be got from the nation's danger. It was the nation speaking, not the politicians. Nor was it the baser passions getting the upper hand. There was no talk of war or vengeance, no comparing our strength and dignity and rights with those of another country, no boasting of what we would do to make our flag and name terrible in the eyes of the world. It was rather that purest love of country which insists that country shall be made a thing to love. To make law respected, to make property and life secure, to strike down the methods of war in time of peace, to affirm and make good the national responsibility for order, and the right of every man and every corporation to labor and to enjoy the fruits of labor—that, in effect, was the aim of the quickened national feeling, and that it has in great degree accomplished. Whose is so dull a soul as not to feel that the country is more worthy of respect and love—a better place to live in—than it was a month ago?

To bring out clearly the genuineness and worth of this manifestation of true patriotism, one has only to contrast it with the sham patriotism which has so many times, in the past few years, tried to palm itself off on the country. There is this to be said for the politicians, that they have always believed in the tremendous power of national sentiment if only they could manage to arouse it and use it. But what they have wofully underestimated in the American people is intelligence. They have thought to fire the popular heart without doing anything for the popular head. Hence have come all the futility and all the fury of our political jingoes. Hence has grown up a most tiresome and meaningless jargon about "the flag" and a "vigorous foreign policy" and making ourselves respected "in the eyes of the world." Hence have proceeded the efforts to work up the American people into a towering rage over some far-off island, which nine-tenths of them know nothing and care less about, or to get up a foreign war with some weak power which it would be a disgrace to fight. Go back only two short years ago and you will see the difference between a President who goes about, with the small arts of the politician, to stir up national sentiment, and a President who stirs it up almost before he knows it. It is in one sense ludicrous, and in another it is humiliating, to recall now the Chilian intrigue, with President and cabinet giving out war news, and pounding their desks, and hurrying up the ironclads, and ordering shot and shells from Europe, and violently waving the flag, and to remember that grown-up men thought that was the way to call forth the patriotism of the American people. The abject failure of such galvanized patriotism, put side by side with the spontaneous and successful outburst of the past fortnight, will long serve for the warning of politicians and the comfort of good citizens.

*COMMON SENSE IN THE SENATE.*

THE silence of both branches of Congress during the recent crisis was broken on Tuesday week, when the Senate took up the subject which was engrossing the attention of the whole nation, and, before laying it aside, made clear the fact that the legislative department of the Government would heartily sustain the executive in putting down the new rebellion.

Peffer was responsible for securing an expression of Senatorial opinion by insisting upon consideration of his Populistic resolution providing that the Government shall assume control of railways and coal mines and "run things" generally. He made a speech in support of his scheme which may be accepted as the epitome of Populism, and it is a satisfaction to get so clear an idea as he furnished of what his party aims at. This is nothing short of the overthrow of the existing government, with its division of powers between the executive, legislative, and judicial departments. He said:

> "I do not wonder sometimes that there is a growing feeling against the political condition of things in Washington. I do not wonder that my friends write to me expressing the hope that the Senate shall be abolished. I wrote to one of them the other day saying that I would vote for its abolition, and I would go further and vote for the abolition of the House of Representatives. I would favor the government being confined to one man (not more than one) from each State. The fewer governors that we have in this country, the better. At any rate, one man can do no worse than a few hundred men have done."

Peffer went on to "speak enthusiastically of the grand spectacle that would be presented when all workmen of the country stopped work; when all the life of the communities would be at an absolute standstill—like the silence of a Sunday morning; when nobody would be at work; when everything would be paralyzed and inert." He concluded by condemning the calling out of the troops. In short, his speech was nothing more nor less than a plea for anarchy.

This treasonable utterance aroused the latent patriotism of the Senate. Mr. Davis of Minnesota was the first to take Peffer in hand. He did not mince words in his references to the Kansas Senator. "I am amazed," he said, "to hear the trumpet of sedition blown in this chamber to marshal the hosts of misrule to further devastation." He characterized the existing situation as "insurrection," and said that, "with all the dormant and latent powers of revolution threatening the country, the Senator from Kansas was advising the dismemberment of the Government and the abolition of the legislative and executive departments." He denounced the Kansas anarchist for having no word of reproof, not a single word of reproach, for the bloodshed that had been going on in Chicago for the last ten days, or the millions of property that had been destroyed. He pronounced Peffer's proposition to stop and arbitrate "just as foolish as if some one, when the battle lines were drawn at Gettys-

burg, had insisted that the impending conflict should be withheld until Lee and Meade had argued, between the lines, the question of slavery in the Territories."

Mr. Davis showed how small a segment of the people of the United States is the band of men under the leadership of Debs, and pointed out the absurdity of their contention that they may interrupt the industries of the nation at their own caprice. As for Peffer's plea that he spoke for "the people," Mr. Davis said:

"The people are, by private letters, by telegrams, in the public press and through the pulpit, crying aloud in condemnation of this most wicked, monstrous, and cruel attack on the very foundations of our civilization, and the Senator from Kansas talks about putting this matter in the hands of the people. The people have taken this matter into their hands through the constituted authorities. It is in the hands of the people in the highest sense of the term—the people of a free country, with laws which guarantee to every man the same right which every other man has, and no more."

Gen. Gordon of Georgia, who bears on his face the marks of wounds which he received in trying to overthrow the federal Government thirty years ago, followed Mr. Davis with an equally eloquent and forcible denunciation of anarchy, and with a promise of support for the national authorities which was even more impressive in view of its source. He pronounced the pretension of Debs that he can order men to desist from labor or to begin labor at his will "so preposterous, so utterly abhorrent to every thought which an American citizen ought to entertain, that it was impossible for him to treat it with any consideration whatever." He closed an admirable speech in these words:

"He stood here to proclaim, not as a Southern man, but as an American citizen—and he wished that his voice could reach every lawbreaker on the continent—that the men who wore the gray from 1861 to 1865, and who confronted the stars and stripes in that great conflict, would be found side by side with the men who wore the blue uniform, following that same flag in upholding the dignity of the republic over which it floated, and every law upon the statute-books."

Mr. Daniel of Virginia, another Senator who served on the Confederate side throughout the war, offered a resolution as a substitute for Peffer's, which declared that "the Senate endorses the prompt and vigorous measures adopted by the President of the United States and members of his administration to repulse and repress by military force the interference of lawless men with the due process of the laws of the United States, and with the transportation of the mails of the United States, and with commerce among the States"; and that "the action of the President and his administration has the full sympathy and support of the law-abiding masses of the people of the United States, and he will be supported by all departments of the Government and by the power and resources of the entire nation." The resolution met with the warmest support from both sides of the chamber, and would have been adopted immediately, by a practically unanimous vote, but for the petty partisanship of a New England Senator, Gallinger of New Hampshire, who insisted, despite the protests of his fellow-Republicans, that it go over a day, apparently in order that he might see if he could in the meanwhile find something snarling to say about Cleveland before voting to endorse the President's course. However, the delay of a day did no harm. The important thing was that the attitude of the Senate had been made clear, and it had been shown that there is no sympathy with anarchy outside the three or four Populist cranks.

The executive department of the Government had already done its duty. The judicial department was engaged in the discharge of its prerogatives. The legislative department emphatically if tardily proclaimed that the executive and the judiciary would be supported by the representatives of the States and the people.

## *AN ETHICAL PROFESSOR REBUKED.*

We published last week a letter from a close observer of Prof. R. T. Ely, "Director of School of Economics, Political Science and History, University of Wisconsin," showing his active, everyday life as a practical ethical socialist. It was a very remarkable revelation, and naturally prompted one to inquire if the University of Wisconsin is content with a teacher of youth who is capable of such performances. A few years ago Prof. Ely sent forth his platitudes on socialism, ethics, and labor from Johns Hopkins University, but that institution was able to spare him when he desired to extend his usefulness over the wider field of the boundless West. He has been "directing" in Wisconsin University for only a short period, but it is apparent from the baccalaureate address of the President of the University, Mr. Charles Kendall Adams, delivered to the graduating class in June last, that the head of the institution is desirous of spreading abroad a belief that there are sounder economic ideas entertained there than Director Ely is emitting. The address, in fact, while not mentioning the director, is made up entirely of assaults upon his "ethical concepts." The President seemed to consider it his duty to remove from the minds of the graduating class, as far as possible in a brief address, the rubbishy ideas which the director had planted therein.

It is well known by all habitual readers of the director's voluminous and flowing publications that he travels always over the same ground, picking his way carefully, as our correspondent pointed out, in order that nobody can say surely that he is heading directly for the camp of the socialist and anarchist. We cannot better illustrate his philosophic method than by citing a few sentences from the article on the town of Pullman which he published in *Harper's Magazine* in 1885. He opened that article with some philosophic reflections upon the "momentous social movement" which is always disturbing his peace, saying of its effect: "The pretty dream of a natural order of things brought about by the free play of unrestrained social forces has vanished." Who had the dream, or whither it had vanished, he did not say, but he went on to declare that it had "given place on the one hand to pessimism, on the other and more generally to a determination not to let things go on of themselves, but to make them go in such manner as may be desired." This is what Prof. Sumner calls the doctrine of making the world over again. Ely assures us that the world had been having its own way long enough, that it was not going to be allowed to "spin for ever down the ringing grooves of change," but that the fellows with ethical concepts had determined to take hold of it and make it "go in such manner as may be desired." Says Ely: "The conviction has become general that the divine order never contemplated a social and economic world left to itself. Material is furnished out of which man must construct a social fabric according to his light." When Ely and others full of ethical concepts speak of "man" or "men," they mean themselves. They are the world-movers and renovators. The way in which they are to work, according to Ely, is to "leave the dim artificial light of the study," turn a contemptuous back upon the "dogmatic assumptions of classic political economy," and "go forth into the broad sunlight seeking immediate realization among the people."

Millionaires always trouble Ely, and he is always on the lookout for them lest they corrupt the laboring man by making him too comfortable. He investigated the town of Pullman in 1885, and discovered that it gave the laboring man a more luxurious home, at a lower rent, than he could obtain in Chicago. He was sure that there was some insidious capitalistic deviltry in this, and smelt "an overvaluation of material comfort and an undervaluation of higher ethical goods." In a passage of great ethical fervor and wonderful foresight he exclaimed:

"Not a few have ventured to express the hope that Pullman might be widely imitated, and thus inaugurate a new era in the history of labor. But if this signifies approval of a scheme which would immesh our laborers in a network of communities, owned and managed by industrial superiors, then let every patriotic American cry, God forbid! What would this mean? The establishment of the most absolute power of capital, and the repression of all freedom. . . . If free American institutions are to be preserved, we want no race of men reared as underlings and with the spirit of menials. . . . Shall we turn about and forge new bonds of de-

pendence? Is not a tendency to do this observable as one of the signs of the times? Are we not frequently trying to offer the gilded cage as a substitute for personal liberty?"

The strike of the past few weeks which the dwellers in Pullman brought on, seems to furnish sufficient evidence that their "gilded cage" had not made them "underlings" or given them the "spirit of menials." As a prophet the director has scored a bad failure, and he can henceforward contemplate with equanimity the building of any number of Pullman towns. He may in time see that his other concepts are equally without foundation in fact, provided he shall live long enough to see this "tough old world," as Prof. Sumner calls it, make practical experiment with them in its own undirected way.

That President Adams has more faith in the world's way than in Ely's is very evident from his address. "Political sages," says Ely in one of his publications, "have in all ages told us that excessive inequality of fortune is a social danger, and especially so in a republic." On this point President Adams says:

"If it could often be said that one man necessarily becomes poorer because another man becomes richer, it would surely be open to question whether this condition of affairs was not radically injurious to society. But such a position, I believe, cannot be maintained. Of course, I do not mean to assert or imply that men of wealth have not been subjected to peculiar temptations, for they certainly have, and they have, no doubt, often yielded to such temptations; but what I mean to say is, that the simple accumulation of wealth on the part of a man who detects and seizes upon the inherent possibilities of a given situation, does not of itself increase the poverty of the poor. On the contrary, it surely diminishes the poverty of the poor, for it opens countless new avenues and opportunities for labor."

No less diametrically opposed to Director Ely's views of Labor and its right to accomplish its ends by boycotting and other and more violent forms of coercion is the following:

"Capital has no right—and so far as I know, does not claim the right—to coerce labor. If it does make this claim, certainly the claim cannot be justified. For the same reason labor cannot coerce capital, the poor cannot coerce the rich. Men often seem to forget that it is the inherent and inalienable right of either to determine whether the terms offered by the other shall or shall not be accepted. Capital—and when I say capital I mean the men in control of capital—have the absolute right to determine what wages they will pay for the labor they seek. This follows from the unquestionable right of every man to determine the price which he will pay for whatever he desires to buy."

As a final quotation, though many others equally pertinent might be made, let us cite this comprehensive statement by President Adams of the real trouble at the bottom of Director Ely's thinking:

"I cannot resist the conviction that there is in this country at large a vast amount of loose thinking in regard to the rights and the wrongs of what are sometimes called the laboring classes. A part of this wrong thinking is the result of a natural and commendable sympathy, and a part of it is the result of an undiscriminating sentimentality. In a vast number, if not in a majority, of cases, suffering has come from improvidence, from extravagance, or from dissipation. Let us take care that we do not attribute results to wrong causes."

## *THE LIMITS OF ARBITRATION.*

It cannot be said that recent events have shed much new light upon the general subject of submitting disputes between employers and workmen to arbitration. The endeavor to induce the Pullman Company to submit to arbitration the question whether there was any question to be submitted to arbitration had something the effect of a *reductio ad absurdum;* and the attempts of various officious, although doubtless well-meaning, persons, to get something or other arbitrated, no matter what, did not promote serious views of the situation. The wretched Debs, in his endeavors to obtain some appearance of concession, suggests President Jackson's caller, who began by demanding a commission as minister to England and ended by begging for an old pair of trousers. But the affair has too many mournful features to be altogether ridiculous, and, in spite of the complete collapse of the boycott, it may have some important results.

As was to be expected, the demagogues hasten forward with their usual proposals for establishing Government boards of arbitration. The only result of such plans hitherto has been to create a certain number of new offices, and to increase thereby the burden of taxation upon the people. The class of persons securing these offices is usually not such as commands the respect of the community, and their adjudications are seldom desired and of little weight. They have no power to enforce their judgments, and they represent no public opinion that would make their judgments effective. As at present constituted, these boards are a useless expense. Whenever arbitration is practicable, arbitrators of higher standing than these functionaries can generally be procured; and when it is impracticable, these officers are as impotent as private citizens.

The nature of arbitration has been often enough explained, but in view of the deepened public interest in the subject it is desirable to restate some elementary truths. Speaking broadly, civil courts exist for the purpose of deciding questions arising out of breach of contract. Their judgments always direct the payment of pecuniary damages or specific performance, and are enforced by the sheriff. Turning to contracts of employment, if they are broken, an ordinary court will adjudge the payment of damages by the employer or the employed according to circumstances. Such a judgment is generally enforceable against an employer, especially since claims for wages are in many States preferred in case of insolvency. Moreover, the legal profession contains members who are not backward in offering their services without advance payment. The remedy of the workman against his employer for breach of the contract of hiring is therefore not only theoretically but practically sufficient. Of course there are failures of justice due to the rascality of employers, but the law does not appear to be at fault.

The remedy of the employer against the workman is perfect in the contemplation of the law, but, owing to the impecunious condition of many workmen, it is practically useless. The game is not worth the candle, and a suit by an employer of labor against a laborer, for damages for breach of his contract to work, is an unheard-of thing. As we have recently pointed out, if contracts were made between employers and trade-unions, actions for damages against the unions would be efficacious remedies, because the unions have funds that could be levied upon. But at present such actions could not, as a rule, be maintained. Moreover, the suggestion, when made in England, called forth a vigorous protest from the camp of the labor agitators. They have evidently no idea of surrendering what they regard as an advantage of position in their contest with capital. Nor is it very probable that this element would look upon the proposition with different eyes in this country, or even that public opinion demands anything of the kind. As we consider it for the best interests of workingmen to make their contracts directly with their employers, rather than to be compelled by the sentiment of their own order to submit to the "walking delegate," we are not especially concerned to thrust legal responsibility upon trade-unions, although they are certainly entitled to it.

It has been proposed that laborers engaged in works which the public interest requires to be carried on without intermission should be prevented from suddenly quitting work, in breach of contract, by making such acts misdemeanors. Such legislation involves no violation of liberty; but it would be violently opposed by the labor agitators, and public opinion does not yet seem to demand it. We have recently witnessed many endeavors to accomplish the same end by the use of the power of the courts to punish for disobedience of their orders. An act not punishable by statute is in this way made punishable at the discretion of a judge, and we need hardly state the grave objections that exist to this practice. It will evidently require statutory regulation, in which case much relief may be afforded; but this regulation can scarcely be extended to disputes in industries not affected with a public interest.

We are thus brought back to the question with which we started: How can the judgment of an arbiter be made effective? We have seen that the judgment of a court of justice is not effective against a workman, and that all

suggestions for making it effective are repudiated by the spokesmen for "labor." They now cry for arbitration; but what they desire is legislation that shall compel employers to pay better wages than they are willing to pay. They wish, when an employer refuses to grant the terms desired by his workmen, to have some third party called in who shall tell the employer that he must grant these terms, and who shall be able to enforce his decree by the armed power of the State. But they reject all proposals for empowering the arbitrator to call in this power against the workmen. It is evident that no such arbitration as this can be conceded. If there is to be any effective interference by outsiders or by the public in trade disputes, it must be made effective upon both parties. And even so the possibilities of such interference, unless voluntarily sought by both parties, are very limited. No power can compel an employer to pay wages if he has no money, and if men are compelled to work by force, their labor, which is of the nature of slave labor, will not be very productive. A bill was once introduced in Parliament to compel night-watchmen to sleep six hours every day in order that they might be more faithful at night; but there are limits even to the omnipotence of Parliament.

---

*FRIDAY NIGHTS IN CONGRESS.*

THE national House of Representatives has two committees often confused—the committee on pensions and that on invalid pensions. The latter is concerned with the late civil war and the former with all others. It is their business to receive and consider a crowd of applications from persons of all ages and both sexes who can establish some species of connection with some one of our five wars, but who have been shut out by some technicality, defect of evidence, or more genuine barrier from the operation of our extra-liberal pension laws. How many of these petitions get reported to the House by the committees in the form of bills is of course variable. When the noble Republican party was in power, it furnished a rich grist from the mill of the committee on invalid pensions, putting on the pension list pretty much every living man who was in the late war, and every wife, daughter or mother of every one deceased; and when the Democracy came in, it must be admitted that the committee on pensions succeeded in resuscitating an extraordinary number of heroes and their representatives over whom the Seminole and Mexican wars had cast a halo of chivalric glory.

But it is one thing to report a bill and quite another to pass it. There is a list called the "private calendar," which entombs as many reported bills as the list of "missing" does wandering champions. If these pension bills waited for the regular consideration of the House, they would never come up. Accordingly, Friday nights are by rule set apart for them. The House of Representatives takes a recess at five o'clock, and at eight reassembles—for the private calendar. At that hour, in a hall filled with a lifeless, effluvia-laden gas that no analytical chemist would class as atmospheric air, there assemble a few score—sometimes not fifty—jaded legislators who have survived the sickening session from twelve to five o'clock. They are about equally divided between Northern Republicans and Southern Democrats.

Between these two parties the number of moderate men who attend because they think they ought to, who support reasonable proposals because they are reasonable, and are bent on considering every case judicially, is nearly crushed out. Like Mr. Pickwick between the editors, they receive the fire-shovel of Pickler and the carpet-bag of Jones patiently, waiting for some chance to mediate, to reconcile, to recall attention to the business in hand and induce the fanatical belligerents to speak to the question, and not either to the galleries or to the constituencies; but their efforts have small success. Every Friday night the speaker *pro tempore* takes the chair to yield it immediately to some chairman of the committee of the whole. The private calendar, or rather such portions of it as relate to pensions and the removal of charges of desertion, is called up. As a matter of course, the measures reported have some element of doubt or weakness; whatever merit they have is equitable and not legal, otherwise they never would be the subject of special legislation. Yet, in spite of this admitted fact, some passionate Grand Army member presses them as if equity were equal to law, and as if the fact that a claim was meritorious at all made it impregnable, and in return some watchdog of the Treasury insists that the evidence is not complete, and that the case is clearly outside law and must not receive the sanction of even a special act. Sooner or later the charge is sure to come from the Republican side that the entire Democratic party is sold to the Confederate interest, and has no friendship for the soldier; and this is met by an indignant reclamation from some Southern member that ex-Confederates have an entire respect for the boys in blue, and never will vote against any honest claimant, but that the present instance is one of those fraudulent, etc., etc., etc.

Between these two, both employing every parliamentary resource of persistency and obstruction, both making long speeches for their constituencies, both goading each other into interruptions that raise the flame hotter and hotter, the two hours and a half prescribed for this particular legislation get wasted and frittered away, and Friday night after Friday night ends with nothing done. But the peculiarly farcical incident which gets repeated almost weekly is this: A bill of the class named is reported, in which without very great difficulty a defect of evidence is discovered. It would be strange, indeed almost miraculous, if after thirty years a claim could be brought up for special legislation which was in all respects without a single flaw. All that its friends assert is that it is meritorious, and that its merits should outweigh its defects. No matter. Mr. Jones of Virginia is sure to rise; he solemnly calls for the reading of the bill and report. He has probably done just the same when the bill was up on some previous Friday. With much elaboration, repetition, and feeling he goes over and over the evidence again and again, points out its defects, asks the committee for what he knows cannot be supplied, and appeals to members not to press such a bill. He has tempted its friends to enter into a perfectly useless discussion, into which trap they instantly fall, as they have done many Fridays before. He now has an excuse for a second speech, in which the same ground is gone over and over again.

Under the most favorable circumstances a vote is reached. The vote is favorable to the bill, but there is no quorum, as there never is on these nights, and as there is not on one-fifth of the bills that are passed by the House after the reports of committees. Never mind. Mr. Jones solemnly calls "no quorum." He will not withdraw his point of order, though appealed to by nine out of ten Democrats present. Neither will the friends of the bill withdraw it, though appealed to by as many Republicans. The clerk calls the roll; there is not one-third of a quorum present. The committee rises, the House adjourns; the evening has been wasted. Mr. Jones and his three or four supporters protest that they never obstruct any but an objectionable bill; the other side recriminates, and those who want to do business and who mean to do business begin considering for the hundredth time what is to be done in a House whose rules make it possible for one man to block everything, and where personal spite and political suspicion turn men into schoolboys.

That pension legislation, especially in the way of private bills, has been reckless and wanton in the past the country is well convinced. That the Democratic majority has it as part of its duty to keep a firm hand on all such work is true. But the proper way to check it is to attend with a quorum and vote all bad bills down; it is not to slip behind the barrier of a few obstructionists who

resort to indiscriminate blocking in order to get a little personal renown.

## TOLSTOI ON MAUPASSANT.

PARIS, July 4, 1894.

THERE are few names in current French literature more popular than that of Guy de Maupassant. He belongs to that realistic school of novelists which had for its first leaders Flaubert and the Goncourt brothers. This school is now somewhat superseded by what is called the psychological school, which recognizes for its chief M. Paul Bourget. The Maupassants are a Norman family, and Guy de Maupassant made his début in literary life under the auspices of the author of 'Madame Bovary.' He certainly felt also the powerful influence of Turgeneff, whom he saw regularly at those monthly dinners an account of which is to be found in the curious 'Journal' of the Goncourts.

In 1881, Turgeneff was paying a visit in Russia to his friend Tolstoi, the famous author of 'War and Peace' and of 'Anna Karenina,' who had not yet become the apostle of a new religion. He handed him a small book: "Read that," said Turgeneff. "It is by a young French writer. You will find it not bad. He knows you and appreciates you." This is told by Tolstoi in an interesting study which he has just published on Guy de Maupassant. Turgeneff added, on giving the volume: "As a man, he makes one think of Druzhinin. Like him, he is an excellent son, an excellent friend, a safe man; and, like Druzhinin again, he is in relations with the workers—he directs them, he helps them. Even his ways with women remind one of Druzhinin." I confess being in total ignorance of Druzhinin, and these comparisons and allusions say nothing to my mind. Tolstoi, who knew Druzhinin well, felt at once a great sympathy for Maupassant, and this sympathy increased after he had read him; he often said of him, "I should like to know him." When he heard of the terrible nervous malady to which Maupassant fell a victim, in the prime of life, he thought for a moment of going to France and nursing him. All his attentions would have been in vain; Maupassant had a general paralysis, and had finally to be shut up in an asylum, where his reason left him before his physical pains had ended in death.

In 1881, when Tolstoi was first acquainted with the works of Maupassant, "I was," he says, "in the midst of my inner task of reconstructing my general views of the world, and during this time the artistic activity to which I had before consecrated all my strength, had not only lost all the importance which I had before attributed to it, it had frankly become disagreeable to me on account of the undue place which it had occupied in my life, and which it generally occupies in the thoughts of the wealthy classes." Tolstoi read the book lent him by Turgeneff only to please him. He confesses that he recognized at once that the author had talent. The book is perhaps the most immoral of all the writings of Maupassant. I dare hardly give its title. There is in it an attempt to show how right and wrong are mingled in human nature, how there can remain natural, innocent, tender feelings in persons whose life is given up to the most horrible corruption. The heroines of the book are common prostitutes of a provincial town; the heroes are quiet, commonplace citizens who consecrate the hidden part of their existence to *liaisons* (I cannot find another name for it) with these prostitutes. There is the most bitter irony in the pictures of these singular relations, which combine something domestic (and sometimes pastoral and sentimental) with the worst brutality.

It is written in the 'Imitation of Christ' that there is something impure in the purest mind, and something divine in the most degraded soul; but the writer of the 'Imitation,' when he expressed this profound sentiment, felt very differently from Maupassant. Our realistic writer did not mean to give us a lesson in humility; he took a real, and one might say almost a wicked, delight in confounding all the elements of social life and all the notions on which are built our ideas of propriety, of decency, of chastity, of virtue. He did not write even in the vein of Victor Hugo:

"Ah! n' insultez jamais une femme qui tombe!
Qui sait sous quel fardeau sa pauvre âme succombe."

For Maupassant, the "femme qui tombe," or rather the "femme tombée," is as good as any other, if not better.

Tolstoi recognizes in Maupassant the special faculty of concentrating his attention on a particular point and subject—a faculty which gives to the man who possesses it the privilege of perceiving what others could not perceive. He saw what others did not see. Only he did not unite in his talent the three conditions which, in Tolstoi's opinion, are indispensable for a true artistic creation:

"(1.) A normal—that is to say, a moral—relation between the author and the object of his creation. (2.) Clearness of exposition and beauty of form, which are one. (3.) Sincerity—that is to say, a very real sentiment of love or of hatred for what the artist paints. Maupassant united only these two last conditions, to the total exclusion of the first, which means that there did not exist in him a normal, that is to say, a moral, relation between himself and the object of his descriptions."

Maupassant saw what others would not have seen; his form was very fine, beautiful, and plastic; he was sincere in that he really loved or hated, but "he did not know the difference between right and wrong; he loved and painted what he ought not to have loved or painted, and he did not love or paint what he ought to have loved or painted." Take, for example, the little tale 'Une Partie de Campagne.' It exhibits a total ignorance of right and wrong; we are made to consider as very delightful and amusing the way in which two gentlemen, while boating, seduce, one the mother, the other the daughter. "The sympathy of the author," says Tolstoi, "goes out visibly to these two scoundrels."

Maupassant was one of the last heirs of the school of "l'art pour l'art," which was so often and so eloquently patronized by Victor Hugo. It seems as if there were no morality in art, as if the two words were incompatible. I was once mildly criticising one of Paul Bourget's first novels to a young married woman—the most virtuous of women, I don't doubt. It was at a dinner-table; my neighbor turned on me with an extraordinary air of compassion, I might almost say of contempt, and asked, "What has art to do with morality?" I have no doubt that, after having first read Bourget, she read afterwards Maupassant; she probably found him even more artistic.

Turgeneff had expressly recommended Tolstoi to read the 'Histoire d'une Fille de Ferme.' This story particularly displeased Tolstoi: "The writer evidently sees in women who are obliged to work physically only brutes incapable of rising above physical law and maternal love." After having read one volume of Maupassant's, Tolstoi said to himself that he was, after all, only one of those clever men who nowadays use their talent in describing what ought not to be described. He ceased to think of him till he fell on another book, 'Une Vie,' and he changed his opinion. "It is not only," he says, "the best book Maupassant wrote, but it is the best French novel written since the 'Misérables' of Victor Hugo." Here he found united the three conditions which I have mentioned above. "The sense of life no longer consists in the adventures of all sorts of dissolute men and women. As the title shows, we have here the description of a life destroyed—the life of a charming, innocent woman, ready for all that is noble, and destroyed precisely by that coarse and bestial sensuality which in the author's previous stories appeared to him the phenomenon which is the centre of everything and which dominates everything. Here the sympathy of Maupassant goes out to all that is good."

There is much exaggeration in the following statement: "The form, which was fine already in the first stories, reaches here a degree of perfection which, in my opinion, has not been attained by any French prose writer." Tolstoi enters into a minute and very delicate analysis of 'Une Vie.' He does full justice to the feeling of life that runs through the book. Speaking of the heroine, he says: "One feels that the author loves this woman, and he loves her not for the beauty of her form, but for her soul, for all that is good in her. He suffers with her, he torments himself on her behalf, and this sentiment forcibly penetrates the reader, in whose soul arise naturally questions which make him reflect on the signification, the meaning, of human life." Here and there are some false notes, but, on the whole, Maupassant appears in this book "as a serious man, whose eye pierced deeply into life and who was beginning to decipher its meaning."

After this, Tolstoi read 'Bel Ami,' of which the hero might be called the Professional Lover. Tolstoi stigmatizes the book as "très sale," and the judgment is not too severe. Still, he discerns in it a serious idea, a sort of indignation which the author feels in view of the prosperity and successes of a sensual brute and in presence of his surroundings. In contrast with this happy brute, Maupassant places an old poet who understands the terrible lessons of life and death; but these lessons are lost on Duruy, the "Bel Ami," who is so full of animal energy and of lubricity that he "hears without hearing and understands without understanding. He hears and understands, but there is in him a spring of voluptuous life which flows with so much force that the evidence of the end which is in reserve for him, as it is for all, does not trouble him."

In the later novels of Maupassant, all the conceptions of life, in Tolstoi's judgment, become confused. He takes the trouble, however, to analyze them all, with much interest; he reviews in succession 'Mont-Oriol,' 'Pierre et Jean,' 'Fort comme la Mort,' 'Notre Cœur.' He discovers in all these a sort of indifference, something factitious; the defects manifest themselves more and more as Maupassant's books become more popular. The eulogies of the press, the avidity of publishers which makes them more and more generous, the constant flatteries of the public, the seductions of the world, have their influence, and it is not a good influence. The novels are even written in haste; Maupassant makes of his art a *métier*. He tries to invent the most interesting personages, the newest and most original situations; he ceases to preoccupy himself with any morality. The personages

are so immoral that their sufferings cease to interest us and we cannot have any sympathy with them. In his criticisms, which have the merit of being very impartial, Tolstoi does not spare the intellectual *milieu* in which Maupassant was thrown; he is very severe on the celebrated Renan, and cites some curious passages from his 'Marc-Aurèle' which show what a secret communion there was between the obscenity of Maupassant and the immorality of the 'Abbesse de Jouarre.'

On the whole, Maupassant's books will remain for a while as a curious document on the manners and thoughts of the end of the nineteenth century in France. Such men as "Max Nordau" will cite them as proof of the decadence and degeneracy of the Latin race. Though their form is sometimes very perfect, I doubt if they will take a permanent place in French literature. Such books as 'Colomba,' by Mérimée, will be read long after 'Bel Ami' is forgotten.

# Correspondence.

## THE QUESTION OF THE DAY.

To the Editor of The Nation:

Sir: There are few parts of this country that have on hand any more important and pressing question than that which lies at the foundation of all government, viz., the right of citizens, either as individuals or as organized companies, to carry on any legitimate business without fear of molestation. This right has been utterly lost in large sections of our country, and is in danger everywhere. Can there be any more pertinent question put to every candidate for Congress or any State legislature this fall than this? "Will you, if elected, do everything in your power to secure such legislation as will make it possible for every citizen, from the humblest day laborer in the land to the millionaire, to carry on any legitimate occupation without dictation or violence from any source whatever?"

We must choose between government and anarchy, and no man who is willing to occupy even a doubtful position should be allowed in any office, high or low. W. H. Johnson.

Granville, Ohio, July 11, 1894.

## SENATORIAL NOMINATION BY CONVENTION.

To the Editor of The Nation:

Sir: The Illinois Democratic Convention at Springfield, June 27, coming as it did almost upon your date of publication, escaped mention in your columns.

It is perhaps worthy of notice that, after a preliminary campaign in which much discussion was indulged in as to whether it would be advisable to nominate in convention a candidate for the United States Senate, the question was finally decided in the affirmative with but one dissenting vote. Thus the Illinois idea of bringing the Senate as near the people as is possible under the present method of electing Senators, dating from the Lincoln-Douglas campaign of 1858, strengthened by the nomination and successful canvass of Gen. Palmer in 1890, has become, we may hope, a settled rule.

Mr. Franklin MacVeagh, the present nominee, is a brother of the Hon. Wayne MacVeagh, Minister to Italy. He represents the best elements of our citizenship, and has nothing of the professional office-seeker in his make-up. If it should become the universal custom to make senatorial nominations in conventions chosen by the people, would other States fare as well as Illinois, or would the bosses in States where the machine is strong be able to carry their Quays and Murphys successfully through the gauntlet of a popular campaign?

Lee F. English.

Chicago, Ill., July 9, 1894.

## M. REINACH AND MR. WALDSTEIN.

To the Editor of The Nation:

Sir: M. Reinach, in his letter published in your issue of May 31, meets my censure of his way of proceeding in a question of archæological science by opposing his method to my own. Here are the facts:

(1.) M. Reinach maintained and maintains dogmatically that the "plaques" are forgeries.

(2.) Prof. Furtwaengler maintains with equal dogmatism that they are genuine.

M. Reinach considers Prof. Furtwaengler "a great archæologist, the greatest of our age after Brunn, a man who is capable of holding a personal opinion, not a vacillating dilettante in archæology." I wish to state in all sincerity that Prof. Furtwaengler, as well as M. Reinach, has made most invaluable contributions to modern archæological research.

But what is the result of such assertion, and what is the good done to science? I can certainly see what harm arises out of such unqualified statement of opinion: it is a blunting of the keen edge of veracity which it is the supreme, almost religious, aim of science to sharpen and refine.

I, for my part, prefer, whether it concern the "plaques," or "the tomb of Aristotle," or any other question, to refrain from a final decision when the data at our command do not warrant a complete induction. The scientific method is the same for archæology as for any other department of knowledge; the shadings from the "demonstrably certain" to the "barely possible" are the same, or ought to be the same. Yet our practice has been different from that of other departments of learning. It is time to stop and to protest; and I confidently leave it to the judgment of scientific men to decide which is the course of true science or of dilettantism, M. Reinach's or mine.

In the case of the head of Iris from the frieze of the Parthenon, I stated its identification in terms which left *no doubt* of its authenticity; the case of the metope head in the Louvre approaches complete certainty; in the case of the "plaques," I have given the student all the material I have found, have stated what I consider probable, always ready to modify my opinion in accordance with the evidence bearing upon the problem.

When I say that the method of the comparative study of style (to which the first chapter of my book on Pheidias is devoted, as the subsequent ones are meant to be illustrations of this method) is tested by the identification of the "plaques," whether they be forgeries or not, I speak the truth. It is misleading to quote as an analogy "the method consisting in detecting that a reduced copy of the Venus of Melos resembles the Venus of Melos"; the plaque was an unidentified terracotta *fragment* of one mutilated figure from the Parthenon frieze, not a reduction of the best-known statue.

It would be better if M. Reinach devoted some of the energy which he expends upon passionate statements to the verification of the dates upon which he founds serious accusations against one of his colleagues. There is one portion of his letter upon which I must comment with emphasis and severity, for it concerns scientific ethics and personal honor, and I beg your readers to give close attention to the following facts. The dates which it is necessary to bear in mind are the following:

1880: Acquisition of the metope head by the Louvre Museum (not 1882, as M. Reinach has it in his last letter).

Christmas, 1881, to 1882: My identification of the head in the Louvre Museum.

August, 1882: Sir Charles Newton's announcement of my discovery in the *Academy*.

Autumn, 1882: My first publication in the *Journal of Hellenic Studies*.

End of 1882: Meeting of the Société des Antiquaires de Paris, in which a discussion takes place *based on my publication*.

1883: Publication of the discussion in the *Bulletin de la Société des Antiquaires*.

1885: Publication of my book; the chapter on the Louvre head in print before the publication of the *Bulletin*.

Now, let me say at once, as I stated years ago, that I in no way wish to cast blame upon the authorities of the Louvre Museum, and that it would be absurd to reproach them for not making every discovery in the museum of which they have charge.

In April, 1886, M. Reinach published a letter in the *Nation* headed "Suum Cuique," in which he charged me with not duly acknowledging the prior discovery and publication of the metope head by the authorities of the Louvre Museum (M. de Villefosse). In June of that year I replied to M. Reinach, and showed conclusively that my discovery was independent and my *publication* was the first, upon which the French publication was based. In the same month a letter from M. de Villefosse himself appeared in the *Nation*, in which he disclaimed any part in M. Reinach's attack, and unequivocally acknowledged my priority. M. Reinach, in his reply of July, had to acknowledge this, though he did not do it generously and with good grace. Now, eight years after this discussion, M. Reinach again implies in his recent letter that I had not duly acknowledged the priority of my colleagues.

This is a wanton imputation upon my honor which I must refute clearly. When I made the discovery of the head, it had been in the museum for nearly two years, and there was *no sign of its recognition* as belonging to the Parthenon. Further, I asked for all information, corresponded about it, had the cast sent to London, and was not informed of any relation it might have held to the metopes. On the contrary, I was told that all that was known about it was, that it came through Vienna from the Piræus.

Whatever the purchasing board of the museum may have had in the inventories, and whatever remarks may have been made at the meeting of the Société des Antiquaires when my paper was discussed, the identification of this head as belonging to the metopes of the Parthenon was as clearly a discovery of my own as any discovery of which I have ever heard, and M. Reinach ought long ago to have acknowledged this, instead of returning to an unfounded charge.

But there are some points of detail in M. Reinach's letter which might tempt me to doubt of his *bona-fides* if they could not be explained by his eager inaccuracy. The point being the priority of date, he makes the following curious omissions. In his first attack

in 1886, he mentions the date of the *meeting* of the Société des Antiquaires as 1882 (the publication which alone I might have seen being 1883); and, though he mentions my publication in the *Journal of Hellenic Studies, he gives no date.* He thus naturally leads the reader to believe that the one which really followed had preceded the other.

In his recent letter he mentions the date (1882) of my first article; but continues, *without mentioning the date*, "*Meanwhile*, in the *Bulletin de la Société des Antiquaires*, a notice *had* appeared," etc., this notice being subsequent to my publication—in fact, based upon the discussion of my paper. He furthermore gives 1882 as the date of the purchase, whereas it was 1880.

This needs no comment. Upon such grounds M. Reinach has brought forward such serious charges.

The discovery is of small merit, and is not of sufficient importance to warrant so much discussion. But the question of scientific ethics raised by M. Reinach's proceedings emphatically is. What he was bound in honor and honesty to do after his first attack, and what he is bound to do now unequivocally, is to state his own mistake and to acknowledge fully my clear identification of the Louvre head. If he does not do this, I must refuse to enter upon any further discussion with a man who (whatever his other merits) has views upon the canons of conduct among men of science so diametrically opposed to my own. CHARLES WALDSTEIN.

KING'S COLLEGE, CAMBRIDGE, July 3, 1894.

P. S.—What does M. Reinach mean by his hint: "I remember having erased from my proof-sheets a rather too frank qualification of M. Waldstein's dealing on that occasion"? No doubt this is very generous forbearance on the part of one whose letter on a definite point drags in every disparagement he can find against me, made by himself or any other person, and ranging from my style to my character. C. W.

## THREE MADISON LETTERS.

TO THE EDITOR OF THE NATION:

SIR: Some letters from Madison to his brother, Ambrose Madison, recently came into my possession, and among them I find three of more than ordinary interest. The resolution on freeing slaves is an incident in Virginian history of high importance, while the letters on the Constitution have never been printed, and give a new light on Madison's position.

Respectfully, WORTHINGTON C. FORD.

WASHINGTON, July 12, 1894.

Richmond, Dec. 15, 1785.

Dr. Bro'r

I wrote to my father a day or two ago by Col. Burnley, to which I refer. The principal step taken since by the H. of Delegates has been the rejection of a bill on which the assize scheme depended. The majority consisted of 63 against 49. Yesterday the vote of the Speaker decided in the affirmative a resolution to repeal the act which permits masters to free their slaves. I hope the bill which must follow on the subject may be less successful. Many who concurred in the resolution will probably be content finally with some amendment of the law in favor of creditors. Should it prove otherwise this retrogade step with regard to an emancipation will not only dishonor us extremely, but hasten the event which is dreaded by stimulating the efforts of the friends to it. The residue of the Revisal from No. 65 will be put off, except the Religious Bill and a few others. Leave was given yesterday for a bill in favor of British Creditors, but not without proofs that it will be opposed in every stage of its progress thro' the House.

. . . . . .

New York, Nov. 8th. 1787

Dear brother,

Having mislaid your last favor, I cannot acknowledge it by reference to its date. It contained two requests, the one relating to Mr. House's rule of calculating the weight of the tobacco; the other to my being a candidate in Orange for the Convention. In answer to the first point I enclose the rule exemplified. If this should not suffice, I will send you a calculation in detail for the whole account. In answer to the second point, I am to observe that it was not my wish to have followed the act of the General Convention into the Convention of the State; supposing that it would be as well that the final decision thereon should proceed from men who had no hand in preparing and proposing it. As I find however that in all the States the members of the Gen'l Convention are becoming members of the State Conventions, as I have been applied to on the subject by sundry very respectable friends, as I have reason to believe that many objections in Virginia proceed from a misconception of the plan, or the causes which produced the objectionable parts of it; and as my attendance at Philadelphia may enable me to contribute some explanations and informations which may be of use, I shall not decline the representation of the County if I should be honoured with its appointment. You may let this be known in such a way as my father & yourself may judge best. I shall be glad to hear from you on the subject, and to know what competition there will probably be and by whom.

As far as present appearances denote, the N. England States, R. Island excepted, will all adopt the new Constitution. N. Jersey certainly will. So will Pennsylvania according to the best opinions, by a very decided majority. I have favorable information also from Maryland; though it is not improbable that the opposition likely to be made in Virginia will have some effect on that side, as well as on the side of N. Carolina, which in general has been said to be well disposed. Like information has been rec'd from the two more Southern States; but it is too early to pronounce on their disposition. This State (N. York) is much divided. The party in power are unwilling to surrender any portion of it. The other party is composed of the more respectable citizens, and is warmly attached to the proposed Constitution. Whatever may be the sense of the majority the State will scarcely have a will of its own, if New England on the one side and N. Jersey and Pen'a on the other come heartily into the measure.

A French packet arrived a few days ago; but brings no decisive information concerning the Dutch. It continues to be uncertain what their fate is to be. A war between Russia & Turkey is said to have been declared by the latter. A great change has taken place in the French Ministry. The Parliament lately banished has got back to Paris, and it is expected that the new taxes against which they remonstrated, will not be enforced. Provincial assemblies are at length established throughout the Kingdom. The Marquis de la Fayette is a leading member of one of them. The Count de Moustier is appointed Minister to the U. States in place of the Chevalier de la Luzerne, and may soon be expected here.

. . . . . .

Richmond, June 24 [1788].

Dear brother,

Yesterday carried us through the discussion of the Constitution by paragraphs. To-day will probably bring forward some proposition and debates relative to the final step to be taken. The opposing party will contend for previous amendments. On the other side, a conciliatory declaration of certain fundamental principles in favor of liberty, in a form not affecting the validity & plenitude of the ratification, will be proposed. The final question is likely to be decided by a very small majority. I do not know that either party despairs absolutely. The friends of the Government seem to be in the best spirits; and I hope have the best reason to be so. At the same time it is not impossible they may miscalculate their number; and that accidents may reduce it below the requisite amount. Two members on that side who went away with a purpose of returning, are still absent, it is said; and a third is so ill as to render his vote somewhat precarious. It may well be questioned whether on every estimate this loss, if it should continue, may not endanger the result. Yours affect'y

# Notes.

THE Congregational Sunday-school and Publishing Society, Boston, has in press a new 'Comprehensive Concordance to the Holy Scriptures,' by the Rev. J. B. R. Walker, to be sold at a nominal price, which could probably as readily have been obtained if the Concordance had been based on the revised version instead of (as it is) on the authorized.

T. Y. Crowell & Co. will publish immediately an illustrated edition of the complete Poetical Works of Sir Walter Scott, in two volumes, with an introduction by Prof. Charles Eliot Norton.

D. Appleton & Co. have nearly ready 'Essays, Biological and Geological,' by Prof. Huxley (the eighth volume of his Collected Essays); 'A Rejoinder to Prof. Weismann,' by Herbert Spencer, reprinted from the *Contemporary Review;* and 'Gen. Lee,' by Gen. Fitzhugh Lee, in the "Great Commanders Series."

E. R. Wallace's 'Descriptive Guide to the Adirondacks' (Syracuse: The Author) has been for more than twenty years available to tourists, and still, after many revisions, preserves a pleasant old-fashioned flavor and retains a few antique cuts among the very numerous excellent photographic views of scenery, portraits of persons, etc. The work is the product of wide familiarity with the region and a hearty fondness for it, and enters into very minute details in all practical matters. An excellent map is folded in a pocket in the cover; it embraces not only the Adirondacks proper, but their outskirts, for the Guide treats also of Schroon Lake, Lakes Luzerne, George, and Champlain, Trenton Falls, the Ausable Chasm, and even the Thousand Islands.

Prof. J. Everett Brady of Smith College has issued, for use with his own classes, a manual entitled 'Women in Roman Literature,' for which he claims nothing more than that it is a compilation, or collection of material, rather than an original and critical study of the subject. This little volume of but eighty-seven pages is likely to prove useful to those who have not ready access to larger works; and the collection, in the appendix, of all the literary productions of Roman ladies which have come down to us cannot but prove a great convenience to any one who desires to survey the whole field at a glance. The book might have been improved by more careful proof-reading. It is perhaps to this cause that we should ascribe the curious mistake on page 12, where Pope Anastasius I. is twice called Pope Athanasius—a name unknown to the list of Roman pontiffs.

The most striking article in vol. xxxix. of Sidney Lee's 'Dictionary of National Biography' (Macmillan) is that on the late Henry Morley, whose death occurred only on May 14. No such prompt inclusion of what we may call the current dead has, we think, been shown before in the progress of this great work. As a whole, the volume, the sixth and concluding one of the letter M, possesses but slight literary interest. A number of old New England worthies and unworthies (if we must put Thomas Morton of Merry Mount in the latter category) figure in it, with Lindley Murray, the

grammarian. Charles Edward Mudie, it appears, before founding his famous circulating library, published for the first time in England, in 1844, the Poems of J. R. Lowell, and an oration of Emerson's in the same year. Both the elder John Murray and his namesake are commemorated in this volume, as is Lord Mansfield (William Murray), of whom it is recorded that in 1769, "on the question whether literary copyright in published works existed at common law, or was a mere creation of statute," he held the former view, though "the latter was eventually affirmed by the House of Lords."

The *Commercial and Financial Chronicle* has issued its 58th volume, embracing the half-year just closed. The value of these volumes as a complete history of contemporary finance is well known and appreciated.

'American Street Railway Investments' is the first number of a publication, designed to appear annually, which deals with the capitalization, history, equipment, and management of the corporations organized in this country for municipal surface transportation. The work comprises reports on more than 1,000 street-railway companies, operating in about six hundred cities and towns. An alphabetical arrangement by localities is wisely followed, and the book itself is a useful addition to investment statistics. It is published by the Street Railway Publishing Company of New York.

The latest volume in the dainty "Collection Lemerre Illustrée" (Paris: Lemerre; New York: Meyer Frères & Cie.), is Paul Bourget's 'Steeple-Chase (Maurice Olivier).' The story is simple, pretty, and pure, and its appearance in this handy form is welcome.

A new volume by Maurice Maeterlinck (Brussels: Edmond Deman; New York: Dyrsen & Pfeiffer) contains three works: "Alladine et Palomides," "Intérieur," and "La Mort de Tintagiles." The first of these three dramas "for marionettes" is the longer and more important, but in none of them does the author strike a new subject or a new method of treating an old theme. There is nothing to be learned from "Alladine and Palomides" and "Tintagiles" which has not already been told in "La Princesse Maleine." Indeed, the effects in this play have been used again in the two works under review, just as "Intérieur" is a weaker "L'Intruse." The same impression of mystery, of vagueness, of mediæval mustiness and superstition is made by these dramas as by the others. There is no greater power—there is distinctly less power in them. M. Maeterlinck is repeating himself, and does not justify the high promise held out for him in Mirbeau's article which first brought him into notice. Very curious are the cuts which illustrate the volume, and which are admirably in keeping with the old-time plays.

"Jean Dornis" is evidently the pseudonym assumed by some new woman writer, and 'La Voie Douloureuse" (Paris: Calmann Lévy) is no doubt her first venture. It is a beautifully written and touching story, full of tenderest grace and deep feeling; sad, as the title indicates, but neither emotionally nor sensationally sad. The characters which suffer most, Jeanne and Yvon, are not weaklings, but endowed with good strong wills, clean minds, clear intellects, and a proper sense of morality. It is refreshing to come upon a well-written and very interesting novel in which the hero and heroine have genuine moral fibre, and prefer fighting against temptations to wallowing in sensuality, either physical or intellectual. Though the scene is laid in Brittany, the authoress has refrained from over-abundant descriptions and excess of local color—another cause for gratitude. 'La Voie Douloureuse' will be appreciated by all readers as it has been by Leconte de Lisle, who acknowledges in a brief letter the dedication of the work to him.

Gyp's 'Le Mariage de Chiffon' (Paris: Calmann Lévy) is bright, brilliant, and witty, as a matter of course. It is a capital book to pick up at the seaside or in the mountains, on a train, or on a steamer. It calls for no effort of the brain to follow the workings of Mlle. Chiffon's mind, and one is gently interested throughout. The young lady's language is composed of a choice assortment of slang, and this will probably prove puzzling to readers who are not versed in this form of French. They must bear in mind that Gyp likes slang as much as she likes swells; and all her aristocrats understand this peculiar jargon, it would seem. Nevertheless, Chiffon would be vastly more charming did she talk good French, and she need lose none of her piquancy, *teste* the delightful heroine of Jean de la Brète's 'Mon Oncle et mon Curé.'

'En Pique-nique' (Paris: Colin et Cie.) is the annual volume of stories, poems, and sketches contributed by members of the "Société des Gens de Lettres." The contributions are all short, necessarily, there being twenty-six of them in this book of 324 pages, and a few are in verse. There are grades of merit among the tales: some are very good, some fair, and some poor, even though written by well-known men. Zola's contribution is of the last-named class. Pierre Maël, Jean Rameau, and Jacques Normand contribute good work, and Jules Simon has a few pages on Renan which, short though they are, are particularly interesting. Paul Gaidot's "Le Secret de Janneyriat" has been read in English; it is the story of the great actor who voluntarily sacrifices his certainty of fame in order to insure the success of the woman he loves.

Signor de Tassinari's brief 'San Francesco d'Assisi' (Florence) may be described as an afterglow of M. Sabatier's brilliant biography. The Italian's rosy enthusiasm gives us a eulogy rather than a study of his subject. If not very original, he is at least in love with his hero, and that fact by itself makes his little brochure worth while.

Part xxiv. of the 'Atlas to Accompany the Official Records of the Union and Confederate Armies' in course of publication by the War Department contains three maps of especial interest—one showing Sherman's operations in 1863–65; another, the campaigns of the Army of the Cumberland during the war; and the third, Utah in 1860, made under Floyd's direction. Parts xxv. and xxvi. consist wholly of views, mostly from photographs, of Forts Sumter and Moultrie after their capture in 1861, of Nashville, the vicinity of Chattanooga, and other places in Tennessee, as well as in Georgia and Virginia. They are of great value. A special interest attaches to the view of the locomotive *Hero*, stolen by a detachment of Gen. Mitchell's men in their famous and tragic endeavor to burn bridges and cripple the Confederate railways; also to that of the Libby Prison. In No. xxvii. the maps and plans are resumed, with Charleston and its defences for the chief, and perhaps the 1867 map of California, Nevada, Oregon, and part of Idaho in the second place.

We have received from Dietrich Reimer, Berlin, the sixth instalment of Kiepert's grand atlas, containing maps of the British Isles, Saxony and Thuringia, Austria-Hungary, Hither India and South America, each accompanied by what we may call its special gazetteer, viz., statistical text, with an index. From B. Westermann & Co. comes the third part of the Spruner-Sieglin 'Atlas Antiquus' (Gotha: J. Perthes), with representations of ancient Palestine and Phœnicia, Greece, Northern Italy and Spain. In this connection we may mention also, coming from the same house, parts ii. and iii. of 'Ritter's Geographisch-Statistisches Lexikon' (Leipzig: Otto Wigand), in which A is concluded and B advanced to Bern.

The last four of the total six numbers of Charles Yriarte's illustrated 'Figaro Salon' (New York: Boussod, Valadon & Co.) have reached us, and are marked, like Nos. 1 and 2, by several Napoleonic selections. We bracket also the allusive canvas of Uhde's "The Flight into Egypt" and Jean Béraud's "Le Chemin de la Croix," in which there is a studied and disagreeable anachronism. In No. 6 we have F. Roybet's "La Main Chaude," an obvious companion piece to his last year's success, "Propos Galants." The pictures by several women are noticeable—a portrait of the papal nuncio by Mrs. Wentworth, and of Mme. Réjane by Mme. "Gyp," with a study of the nude by Miss Lee Robbins. The last two are lightly touched off in the text by M. Yriarte. There is a respectable sitting figure of Jeanne d'Arc, by Mme. Signoret-Ledieu; but the most striking piece of statuary is Saint-Marceaux's "La Faute."

Mr. Waters's "Gleanings in England" in the July number of the *New England Historical and Genealogical Register* will interest Rhode Islanders and Long Islanders, but are most remarkable for a large body of notes relating to the family connection of the Apostle Eliot, which is all but conclusively identified with the family whose pedigree is given in the Visitations of Essex, published by the Harleian Society. "One fortunate discovery in the shape of a will may settle the whole matter for us"; and who so likely to make this discovery as Mr. Waters? He prints the will of the Apostle's father among the rest.

The *Geographical Journal* for July opens with Mr. C. R. Markham's presidential address before the Royal Geographical Society, in which he dwells especially on the most recent Arctic expeditions. His highest praise was given to Mr. Peary, whom he looks upon "as an ideal explorer." An interesting statement was made in respect to the new catalogue of the Society's library, which is now in print. It is an alphabetical catalogue brought down to 1893, and has two appendices, the first containing an alphabetical list of all the collections of voyages and travels, with an analytical table of contents to each volume; the second being devoted to anonymous and periodical literature "arranged in geographical order." A still more important work which is in preparation is a subject-catalogue, which is to contain the titles of books, pamphlets, and papers in periodicals and transactions. It will comprise about 110,000 titles, 84,000 being those of papers and articles, and will be completed, it is hoped, in two years. Mr. W. L. Sclater continues his account of the geography of mammals, in this paper treating of the Australian region, in which he includes New Guinea, New Zealand, the Moluccas, and all the Pacific islands. The recent territorial arrangements in Africa between England and the Congo Free State and Italy are explained with the aid of two useful maps showing plainly the new boundaries. The other maps are one illustrating Mr. Sclater's paper, and an admi-

rable map of Tibet on a scale of sixty miles to the inch, embodying the very latest information received from travellers and the official reports of the Indian Survey. It is interesting to note upon this map that the middle courses of the great rivers of eastern Tibet are still left indeterminate. This part of Asia, containing very probably the most magnificent river scenery in the world, is still as inaccessible to white men as the North Pole.

The very interesting and scholarly lecture which M. Théodore Reinach delivered when the Greek music of the hymn to Apollo was given at Paris last April, appears in full in the *Revue de Paris* of June 15. The paper needs no praise, either in regard of its interest or of its learning. It is a most valuable contribution to our scanty knowledge of ancient music, and need only be indicated. Part of the music of the hymn is given, with both the modern and the old Greek notation. Other noteworthy articles in the same number of the *Revue* are "Une colonne de guerre au Soudan," by Commandant Péroz, being a liberal instalment of his forthcoming book on the campaign of 1891-92 against Samory; a study of "Le Père Joseph," by M. Alfred Rebelliau, in which the more recent and more favorable view of the celebrated counsellor of Richelieu is asserted against the popular notion of him derived from A. de Vigny and Michelet; an appreciation of the Memoirs of the Prince de Joinville by Comte A. de Circourt, himself an old Legitimist and one of the few survivors of the French navy of 1830; and an article on the revival of the Olympic games, which contains many statistics of modern sport, but very little about the Olympics, old or new.

In a communication to the Academy of Inscriptions and Belles-Lettres the director of the French School of Rome announces the opening of a new gallery of casts which will serve as an annex to the chair of archæology in the University, and will be open to study. M. Geffroy also reports that at the last sitting of the Academy of the Lincei he saw and examined the leaden *ex-voto* objects recently found in the ruins of the temple of Anxur. They are all child's playthings: a little table, a little chair, a little sconce. The Jupiter of Anxur was, as is well known, worshipped under the form of a beardless boy, and it appears that these were deemed suitable offerings to a divinity of tender age. In the course of the excavations in this temple the orifice of a sort of natural conduit, which runs far back through the rock, has been found. Out of this blows a steady and strong draught of air.

A movement has been set on foot at Aquila in the Abruzzi, the nearest considerable town to the site of the ancient Amiternum, the birthplace of Sallust, for the purpose of commemorating that historian by the erection of a monument. The names of Bonghi, Brunn, Crispi, De Gubernatis, Gregorovius, Max Müller, Overbeck, Von Sybel, and others in the list of patrons of the undertaking guarantee its serious character. Contributions from the United States are solicited. They may be sent to Prof. F. B. Tarbell, University of Chicago, Chicago, Ill., who will forward them to the executive committee. "The names of subscribers will be recorded, for permanent preservation, in an appropriate volume in the Municipal Palace of Aquila."

A committee of citizens of the District of Columbia, with Frederick Douglass at its head, invites subscriptions to a plain monument to John Brown on the site of the historic engine-house at Harper's Ferry. The Baltimore and Ohio Railroad has granted the land and will take care of the shaft proposed to be set up. The secretary is Robert H. Terrell, 609 F Street, N. W., Washington.

—The four days' meeting of the National Educational Association held at Asbury Park, N. J., which closed its session Friday evening, July 13, had several noteworthy features. It was preceded by a four days' session of the National Council, composed of two representatives from each State, the meetings of which were largely attended, and marked by interesting papers. The association now has a fund of $30,000 to $40,000, and is able to make appropriations for researches, as it did for the expenses of the "Committee of Ten"; but it declines to do so, at least till its fund amounts to $50,000. This is unfortunate, as the new department of child study, just admitted (thanks to the efforts of United States Commissioner Harris and President Lane, with only four dissenting votes), has now greater need and could make better use of money than has ever been possible before, seeing that associations for this study have been organized in no less than nine cities or States. The sentiment of the educators against the strikers found expression in many ways and at nearly every meeting and section; the climax, perhaps, being reached on Wednesday evening, when things looked darkest and it seemed doubtful if Western delegates could reach their homes. The vast audience was asked, at the suggestion of Superintendent Maxwell of Brooklyn, to rise and sing "America." The singing and the effect were nothing less than electric, and a large part of the audience were in tears at the close. Every one seemed disposed to ask whether teachers had done their full duty in inculcating civic and industrial virtue. The many discussions of the "Report of the Committee of Ten," which was adopted and the committee discharged, footed up, perhaps, somewhat as follows: For State universities no good could come of it, as satisfactory arrangements now generally exist between these institutions and the schools that fit for them. In several faculties where it had been carefully considered, it was reported that nothing could be done. The doctrine that every study has equal educational value if well taught—which is a leading dogma of the Report, although one member of the committee declared it had been definitely voted down—found no support or supporter, but a strong consensus of opinion against it. The sentiment was also widely expressed that the Report was in the interest of the 3 per cent. of the boys fitting for college, more than in the interest of the 97 per cent. who do not go to college, and a few doubted whether most studies should be begun in the same manner by these two classes. Much was said in favor of unification of studies and against the distracting influences of the mob of branches that have in recent years entered the school curricula. The last chief vein of interest which ran through scores of papers at this great meeting was moral training. On the whole, these meetings have steadily improved during recent years. College and university men, whose presence was once almost suspected, have not only come in, but have greatly helped. Most of the papers are more carefully prepared. The school book and supply interest has been relegated to a building of its own, and although the noise of many axe-grinders is still heard—sometimes even in the papers—it is distinctly less than it used to be. The publishers' exhibit by itself was never more suggestive or interesting.

—The commemorative volume contributed by the pupils of Prof. Henry Drisler, in honor of the fiftieth year of his official connection with Columbia College, has just made its appearance (Macmillan). It is a handsome book of about three hundred pages, representing a very wide range of subjects in philology, philosophy, ancient art, and archæology, and appealing to the literary public as well as to professional scholars. Prof. Gottheil, in a paper which is not altogether *caviare* to the general, collects all the references to Zoroaster found in Syriac and Arabic literature, which incidentally include many curious passages on the adoration of the Magi. Prof. Butler points out a remarkable anticipation by Anaximander of Mr. John Fiske's contribution to the theory of evolution—the discovery of the importance of a prolonged period of infancy to the psychical and physical development of man. The general reader will find much new and interesting matter in Prof. Gudeman's "Literary Frauds among the Greeks," and in Prof. Hopkins's discussion of the question, mooted some time ago between Max Müller and Whitney, of "Henotheism" in the 'Rig-Veda.' Mr. Hopkins reaches the striking conclusion that the poets of the Rig-Veda were esoterically, to a great extent, unitarians; and that the hymns represent the fading of pure polytheism, and the engrafting upon a polytheistic stock of a speculative homoousian tendency, soon to bud out as philosophic pantheism. "Every Vedic poet is more or less a Xenophanes. The 'Rig-Veda' is not naïve; it is theosophic throughout." In connection with this sophisticated tendency it is worth while to inquire once more, What is the age of the Vedic hymns? Jacobi and Tilak have quite recently broached independently an ingenious astronomical theory which assigns to them a date of between 3500 and 2500 B. C.; but Prof. Perry, in his "Notes on the Vedic deity Pūsan," remarks that this great antiquity will not be able to maintain itself, and that little of the Vedic literature can be placed earlier than 1500 B. C. Prof. Sloane takes a somewhat new view of the relation of the Arabs to Aristotle, assigning to the monastic sect called "The Brothers of Purity," and to Avicenna, a rôle more important and original than is customary to concede to them. They were not merely blind conservators of the great philosopher's doctrine; they absorbed new ideas from the Koran and from Christianity, and by their restless investigations reached "a modified and powerful peripateticism which was distinctly their own." This had its influence, in part directly, in part through the Moors and Averroes, upon the scholasticism of the West, and finally upon the whole movement which issued in modern science.

—Turning from philosophy to literature, we note Mr. Brander Matthews's clever paper, which suggests a profitable line of inquiry, and draws some well-founded parallels between ancient and modern drama. The "Medea," as he suggests, is obviously a "star-piece," and *Medea's* "star-part" is dexterously provided with what we call "exit-speeches." It was in all probability written to "fit" some actor of special talents, just as M. Sardou, in composing "La Tosca," fitted Mme. Sarah Bernhardt. The immense vogue of the Euripidean plays was due in some measure to the dramatist's technical mastery of stage-business, and his clear conception of what the spectator demanded. With Mr. Matthews's criticism may be classed Mr. Woodward's dis-

sertation on "Iphigenia in Greek and French Tragedy," and Mr. Hussey's investigation of the relation of Plato to the Attic comedy. He infers that the first four books of the Republic were published before the others; that "the waves of laughter" apprehended by Socrates in the fifth book were set in motion by the comedian Theopompus in his play of "The Stratiotides" (The Soldier Girls), and may have given rise to the defence in the fifth book. The School of Art and Archæology is represented by Mr. Julius Sachs's discussion of the "Medusa Ludovisi," which he plausibly makes out to be a dying Penthesilea, and in three admirable essays of Prof. Merriam. These, by their mastery of method and detail, remind us of the tradition that still lingers in the American School at Athens of the rare usefulness of Mr. Merriam's directorate. The originals discussed belong to the Metropolitan Museum; and the essays prove that there is material in New York as well as in Athens for the trained student of ancient art, and that we need no longer go abroad for experts competent to classify and interpret it. In Mr. Jackson's learned paper on Persian armor, we notice a few misprints. We must pass over certain articles whose elaborate or purely technical character does not admit conveniently of summary. We notice two misprints on p. 117.

—The master and fellows of Balliol College have appointed the Speaker of the House of Commons to succeed the late Lord Bowen as their Visitor. Mr. Peel has gladly accepted his unanimous election, and is now duly installed. The nearest analogy to the position of the Visitor of an Oxford college offered in the constitution of older American colleges is that of the "Corporation" or "Board of Trustees," and it must be admitted that the analogy is anything but close. In the very unusual event of a failure on the part of the college fellows to elect a head within the statutable limit, the College Visitor is bound to act in their place and choose for them. Within two years this case arose at Pembroke College, whose present head was chosen by its Visitor, Lord Salisbury. The Visitor of Pembroke, as of Hertford College, is the Chancellor of the University *ex officio*, the Bishop of Winchester is *ex officio* the Visitor of five Oxford colleges, while twelve others are visited by other ecclesiastics, or functionaries; the Earl of Pembroke is hereditary Visitor of one (Wadham). Thus Balliol stands alone among the twenty-one Oxford colleges in having the power to bestow the visitorship just given to Mr. Peel. The statutes of Balliol College do not apparently contemplate the possibility of the simultaneous or nearly simultaneous demise of its master and its Visitor, for the Visitor's presence is necessary at the "induction" of the master, while no Visitor can be duly elected unless the master has cast a vote at the election.

—The lectures delivered in the spring of 1893 at Florence are but now beginning to be printed. The first volume, just published under the title of 'La Vita Italiana nel Cinquecento: Storia' (Milan: Treves), contains articles by Ferrai on Francis I. and Charles V., by Masi on the Reformation, by Del Lungo on the Siege of Florence, by De Johannis on Political Economy in the Sixteenth Century, and the Discovery of America, and finally articles by Rondoni on Siena in the Sixteenth Century. Although all are readable, only the lectures of Masi and De Johannis deserve special mention. Signor Masi in a few pages says more that is to the point on the subject of the Reformation in Italy than will easily be found elsewhere. He shows that it never became a popular movement; that, in spite of its being for a time a fad among all society people, the Reformation never took a real hold in Italy, all the persons who favored it being either, like Contarini or Vittoria Colonna, unable to break with Catholicism, or, like Ochino and Socinus, too heterodox even for Protestantism. As to the opponents of the Reformation, they never for an instant granted that there could lie back of it more than pedantry or mere wrongheadedness, and so well did they succeed in impressing this view that it is still the prevalent one in Italy, as is proved by Balbo's 'Storia d'Italia,' the most popular and most prized by the Italians themselves.

—Signor De Johannis's article is even more interesting. It is truly refreshing to come across a writer who confines himself to a definite portion or period of the Renaissance, and treats it from the sociologist's instead of from the art critic's or scandal-monger's point of view. Without wholly denying that the discovery of America hastened the decay of Italian prosperity, Signor de Johannis protests against the usually accepted view that this was a principal cause. He shows that at the end of the fifteenth century Italy was already in decline, and assigns, as chief sources of evil, senseless extravagance in public and private life, State interference with commerce, and crushingly burdensome taxes. The momentum of the decline was then increased by the Spanish hegemony, Charles V. being guilty not only of doubling the evils already existing, but of encouraging the revival of feudalism and monasticism, and, worst of all, of destroying credit by systematic coin-clipping. The final blow came from the increase of the precious metals. Contemporary Italian writers, Signor De Johannis affirms, were well aware of many of the factors in the ruin of their prosperity, and, in the discussions which arose, anticipated a number of the economic theories of to-day, and may thus be considered the real founders of the science of political economy.

—Vienna is at last to have a Goethe monument—that is to say, if the final decision of the Goethe-Verein may be accepted as final. Since 1886 the question of the erection of such a monument has been discussed, referred to committees, submitted to juries, reconsidered by the judges; and all this with the same heat and degree of partisan feeling which characterize the politico-religious quarrels that invade Parliament, the municipal council, the university, and even the hospitals. Alas for the old Vienna *Gemüthlichkeit!* Hellmer and Tilgner are the sculptors who have divided artistic Vienna into two hostile camps, not for the first time. When, a number of years ago, prizes were offered for the best design for a monument to Mozart, Prof. Edmund Hellmer was awarded the first prize; but popular opinion rebelled in favor of Viktor Tilgner, whose busts had become deservedly famous, and the jury, after adding to its numbers, reconsidered the matter, and charged Tilgner with the execution of his design. The same two sculptors were asked to hand in designs for the Goethe statue. Both designs were pronounced excellent, but Tilgner had violated one of the rules of the competition by submitting a model twice as large as prescribed, and hence the prize was awarded to Hellmer. The decision, however, only reopened the former controversy as to the relative merits of these artists, and, to give it added zest, one of the jurors himself, Dr. Albert Ilg, director of the imperial historical art collections, and a well-known writer on æsthetics, who had been compelled to vote against Tilgner, turned against Hellmer in the fiercest manner, at the same time attacking the sculptors of Vienna in a body as ignorant and without an adequate conception of the personality of Goethe. The Association of Artists thereupon held a solemn indignation meeting, at which Prof. Rudolph Weyr, one of the most highly esteemed artists of Vienna, soundly castigated Dr. Ilg. The dispute reached its height when Tilgner himself, although an intimate friend of Ilg, repudiated his warfare in an emphatic manner. "I feel," he said, "as if Ilg had seized me by the legs and hurled me at my opponents in order to crush them." The Goethe-Verein, divided between the adherents of Tilgner and Hellmer, resolved to hold an extraordinary meeting to consider the advisability of ordering a new prize competition. Several hundred members were hurriedly added to the association, and a sensational outcome was expected. But, fortunately, calmer counsels prevailed, and the meeting confirmed Prof. Hellmer in the right to execute the work. An anonymous writer in the *Neue Freie Presse*, in whom it is easy to recognize that graceful *feuilletoniste*, Herr Hugo Wittmann, taking up the charge of ignorance brought by Dr. Ilg against the Vienna sculptors, reminds him that Dannecker, the creator of the best Schiller bust in existence, never learned to spell correctly, and he adds, in an æsthetic apothegm worthy of Lessing: "Was, der Künstler wäre nicht gebildet, er, dem das grosse Geheimniss der Welt, das Walten der Menschenseele und die Entstehung des Lebens sich erschlossen hat? . . . Ihm, dem Bildner fehlte es an Bildung? Er macht sie ja!"

## MARSHALL'S PAIN AND PLEASURE.

*Pain, Pleasure, and Æsthetics:* An Essay concerning the Psychology of Pain and Pleasure, with special reference to Æsthetics, by Henry Rutgers Marshall, M.A. Macmillan & Co. 1894. 8vo, pp. xxi, 364.

Mr. Marshall's volume is another indication of the rate at which the tide is rising in our country in matters philosophical. The feelings of pleasure and displeasure form a truly immense portion of the life of Man, but Man's attempts to give to himself some intimate account of their conditions, whether inside or outside of his organism, form a very shabby episode of his achievements in the theoretic line—so shabby, indeed, that one's first impulse is to shy away from any book with the word "Æsthetics" in its title, with the confident expectation that, if read, it could only emphasize once more the gaping contrast between the richness of life and the poverty of all possible formulas. A better day, it is true, has begun to dawn of late, since the high-priori road has been less travelled, and the Kantian, Hegelian, Schopenhauerian, Herbartian, and other Teutonic efforts to reduce the life of æsthetic feeling to some single essential conception, have begun to yield to the more modest study of minute particular effects. But either through hollowness where ambitious, or where solid then through triviality, the outcome of æsthetic theorizing has not been such as to puff one up with pride. Everything that is subtle in our preferences escapes from the accounts that are given; the nature of the pleasure and pain-processes in the nerve-cen-

tres still remains unknown; and the student concludes that the experience of a single strain of melody or verse of poetry, of a single square foot of genuine color, is more important to the soul than the reading of all the books on beauty ever composed.

Now it cannot be said that Mr. Marshall's book quite puts an end to this state of things. No philosophy, however wide its sweep or deep its dive, will ever be a substitute for the tiniest experience of life. But, all allowances made for this necessity, it may well be said that Mr. Marshall's essay is the most successful of all yet published attempts to conceive our pleasures and displeasures under something like a single point of view. It is written with extreme dryness, for hardly a concrete example of a beautiful effect adorns its pages; but one does not feel (as in so many German essays) that this is the dryness of an irreclaimably inartistic nature on the author's part. It seems rather the respect of an artistic nature (which is also philosophical) for facts to which it knows in advance that philosophy must be inadequate; and the deliberate preference, while philosophizing, to be as abstract as it can, and to leave particulars, with their subtlety, to be disposed of by the concrete man. Beauty, indeed, must be dissected; but the dissecting-room is no place for the living body of her to come in.

This respect for the sacredness of individual likes and dislikes is perhaps Mr. Marshall's most striking feature as an æsthetician. Anything remoter from academic dogmatism cannot be conceived. The beautiful in art or nature is such only because it can give pleasure to somebody. There is not within the field of possible pleasures one tract in which those lie which we call "higher" or "æsthetic," while all outside of these are low and common. All fields of pleasure-getting are within the scope of the æsthetic, provided they befall us in such a way that their after-taste is as agreeable as their first impression. But the revival of a pleasure in our thought need not itself be pleasant, and often does in fact bring with it a consciousness of consequential pain. When this is the case, we do not *judge* the experience as we immediately *felt* it; and non-æsthetic pleasure, or that pleasure which is ephemeral, thus becomes contrasted with æsthetic pleasure, or that which is permanent and unmixed with any source of later pain. The æsthetic value of an experience is thus, for Mr. Marshall, a resultant of its pleasure-giving and pain-giving tendencies in the long run; and any object will have positive æsthetic value (whatever be the *sort* of pleasure which it yields), provided that pleasure be pure and do not pass into its opposite anon. Thus *the exclusion of secondary displeasures*, of pains, whether of restriction or of excess, is one great principle of beauty, *the elimination of ugly elements* is one great line of progress in the different arts. This by itself, however, could lead only to tame correctness, to the "icily regular, splendidly null." Not only the purity thus reached, but positive and vivid pleasantness must characterize the elements that are left, if we are to have a rich effect; and the conditions both of vivid and of permanent pleasantness are thereupon carefully studied by our author, from whose general theory it follows that contrasts, releases of inhibition, and satisfactions of expectancy, width and variety of field, with repetition of elements, and shifting centres of interest, must all be present for the maximum of pleasure to be attained.

The general theory just referred to is that of the physiological conditions of pleasure and pain. Mr. Marshall rejects *in toto* the notion that there may be specific nerves or specific brain-centres for these qualities of consciousness. Since any "content" whatever of consciousness, any sensation, emotion, idea, or volition may be a pleasant experience, and then, the conditions changing, become a painful one (or vice-versa), he prefers to consider pleasure and pain as mere *manners* of experiencing the "content," manners due to modifications in the neural process, whatever it may be, by which the content is brought to our attention. There is no content which under certain circumstances might not come to consciousness in a pleasant, and under other circumstances in a painful, manner. In other words, there is no content which *essentially* is either painful or pleasant. Pleasure and pain are therefore not distinct objects of consciousness, as sensations, relations, emotions, and volitions are; but they are (in Mr. Marshall's decidedly awkward terminology) *quales* of *other* objects. And more than fifty pages are given up to showing that the usual division of consciousness into three primordial kinds, intellection, pleasure-pain feeling, and conation—all coördinate with each other—is incorrect.

Were there separate nerve-tracts to be shown for the three kinds of consciousness in question, the division would be correct, according to our author. But the pleasure-pain feeling has no separate nerve-tracts, and merely follows the temporary state of nutrition of the tracts for intellection and conation. The fact that all pleasures, whether of sensation, thought, or action, are ephemeral, points to something being *used up* in the case of pleasure. This points to *storage;* and the fact that the too long continuance of any experience produces pain points to the storage-account being *overdrawn* in the case of pain. Mr. Marshall's physiological theory accordingly is this: that when the organs involved in any conscious affection respond with unusual efficiency to the stimulus which excites them, we feel pleasure; and when they respond inefficiently, we feel pain. Efficient response is response great in amount; and it is greatest when the surplus stored force in the nerves is greatest. Inefficient response is small response, due to little or no stored force being available. In other words, pleasure is the concomitant of all copious and free discharges of force; displeasure the concomitant of scanty and difficult discharges.

The number of particulars in our experience which this simple conception covers is surprisingly large, and is followed out by Mr. Marshall with a minuteness, both constructive and polemic, which is altogether admirable. He takes so many things into consideration that in a review like this it is quite impossible to give any impression of his scope. The radical point in his treatment, and the point which all later-coming theories will have to emphasize as he does, is the essentially mutable and shifting character of our enjoyments and displeasures. In the twinkling of an eye they are changed, according to the conditions of rest or fatigue of the organs by which we experience them, the whole secret of epicureanism being to catch the proper moment and interval for pure delight. Another point original with Mr. Marshall is that the pleasure of relief from a tedious experience is felt not in the organs whose functions stop, but in *other* organs than those which a moment since were giving us displeasure. These other organs, inhibited until now, start into an activity which we realize with gratification, while the previously taxed organ sinks to rest. The gratification of the new activity is the so-called relief. We think Mr. Marshall much less happy in his account of the "pains of obstruction," which are a class of displeasures as definite as is the class of pleasures of relief. Thwarted or suspended activity leads to craving, and this, says our author, is a pain due to the "gorged condition of the nutritive channels" in the parts whose exercise is inhibited, and in remoter parts upon which these vainly "call for aid." In short, "craving" is due to nutrition "beyond the limits of storage"; but would appear, on these terms, to be a pain whose physiological condition is precisely the reverse of that laid down for pains in Marshall's general law.

In spite of this and other shortcomings, however, we must repeat that no previous writer has given a general formula which covers anything like the same amount of ground. Acquaintance with Mr. Marshall's work will be indispensable to every future student of the subject. His own learning is admirably complete; we cannot name any modern author of consequence of whose writings he has not taken account. The modesty of his tone is also remarkable, considering that his mental temperament is "radical," and that he is fighting for a creation of his own. Apart from its special topic, too, the book is full of shrewd and original psychology. All these qualities render it almost "epoch-making" in the present situation of science. But the definitive value of its teaching is another matter, on which we must confess to some misgivings. First of all, the terms of Marshall's general law, that any nerve-discharge is pleasant when it is greater than that which the stimulus habitually calls forth, are evidently not ultimate. Merely to say that a process exceeds what is habitual is not to give a physical definition of it. Physiologists will certainly not be satisfied with Mr. Marshall's law until they can translate it into their own terms. Only when the habitual comes to signify some determinate form of physiological equilibrium, and the super-habitual another form of process, will they accept it as the expression of a genuine psycho-physic relation. At present, while professing to be physiological, the law is really, they will say, quite "transcendental." An even graver fault, we think, may be imputed to Mr. Marshall: Is not his whole attempt to find a single formula a vicious one? Are the various forms of displeasure of which we are susceptible, rightly to be gathered up under the single name of "pain"? Have such diverse disagreeables as toothache, nausea, nervous anxiety, grief, and the perception of ugliness, anything in common except their common intolerability? And in particular, might not "pain" *par excellence* (the tactile pain of cutting, burning, crushing, and inflammation), and nausea also, well be energies of specific nerves, while the milder and less localized displeasures might be such "*quales*" as Mr. Marshall contends for? The conscious quality is so different in these different cases that mere analogy would naturally lead one to ascribe them to entirely different processes. Is not also the conception of "Æsthetics" far too wide for any profitable treatment in general terms? Have the classically beautiful, the interestingly ingenious, the emotionally exciting, the neatly accurate, the grotesquely unreal, and the humorous, anything in common except that they are *welcome*, and is it likely *a priori* that the welcomeness is in all cases due to the same kind of process being aroused?

Such doubts, and many others, remain to

haunt one after reading Mr. Marshall's book. They show how rude in these matters human thought still is. In science the first things produced are sweeping theories. Then come special inquiries; and finally sweeping theories again. We believe Mr. Marshall's sweeping theory (although worth more than any previous one) to belong to the earlier and ruder kind; and we suspect that real knowledge of pleasure and pain can for some time to come only grow out of humble study of separate and particular effects.

## GEN. JOHN PATERSON.

*The Life of John Paterson*, Major-General in the Revolutionary Army. By his great-grandson Thomas Egleston, LL.D., Professor of Mineralogy and Metallurgy in the School of Mines of Columbia College. New York: G. P. Putnam's Sons. 1894.

It seems not a little strange that a Revolutionary hero "so proper and so soldierly" as Maj.-Gen. John Paterson should have been left to wait till the present year for his proper and his soldierly commemoration. Because of this long delay, the soldier with all his merits, and the biographer with all his industry, must needs pay their respective penalties. Materials which might have been used to heighten the soldier's meed of fame and to lighten the task of his biographers were lost in the burning of Gen. Paterson's house in 1809, and have been left to perish elsewhere by slow decay under a lack of the requisite biographical interest in his renown among even his lineal descendants. When in 1876 Lieut.-Gov. Rockwell was called to deliver a centennial address at the town of Lenox, Mass., a town of which Gen. Paterson was perhaps the most distinguished citizen, the orator found that at that date the Revolutionary patriot and soldier "had become one of Massachusetts's lost heroes." It was, indeed, the very meagreness of the knowledge then attainable about him that has led to the study and research which have resulted in the present volume. The author confesses that in all his laborious quest he has found comparatively little which has never been published before, but this little is valuable alike for the light it throws on the character of a well-balanced man, and on the peculiarities of the time in which he acted so long, so unambitiously, and yet so conspicuously. The shortest abstract and the briefest chronicle of Gen. Paterson's life and career will suffice to show that he was a man of merit and of mark in his day and generation.

Born at Farmington, Conn., in 1744, and graduated at Yale College in 1762, he was bred to the profession of law while teaching in the public school at New Britain, Conn. Early in 1774 he removed to Lenox, Mass., was at once elected the clerk of that "Propriety," and was sent as its delegate to the General Court of the colony. A leader in the political agitations of the time, he was a member of the Berkshire Convention of 1774 which protested against the ministerial policy of England, and signed the "Solemn League and Covenant" against all commercial dealings with England so long as the oppressive acts of Parliament should remain in force. He was a member of the Provincial Congress of Massachusetts, which met from time to time in 1774 and 1775. Before the year 1774 ended he had raised a regiment and was commissioned its colonel. Soon after the affairs at Lexington and Concord his regiment was enrolled as a part of the Continental Army. Early in 1776 he was sent with his troop to Canada, but reached our army there in time only to share in its disasters and miseries. After a short service under Gates he joined the army of Washington, took part in the battles of Trenton and Princeton, was made brigadier-general in 1777, was detailed again under Gates and fought in the battles of Saratoga, wintered with Washington at Valley Forge, held the left flank at the battle of Monmouth, commanded at West Point, and, because of his trustworthiness, was left to serve with the army of observation in the Highlands on the Hudson while Washington marched to Yorktown. He was commissioned major-general in 1783. As he was among the first to join, he was among the last to leave the Continental Army. He was one of the founders of the Society of the Cincinnati. As a major-general of the militia of Massachusetts he defended the cause of law and order in Shays's Rebellion. Removing in 1791 to southwestern New York, he was the first judge of Tioga County, its first delegate in the State Legislature, and its chief justice in 1798. He was elected from his district a member of the U. S. House of Representatives in 1802, and served in it for a single term. When the county of Broome was set off from Tioga, he was made chief justice of Broome, and held that office till his death in 1808.

With the exception of Lafayette he was the youngest officer of his rank in the Revolutionary Army. Because of his legal knowledge and his military capacity selected again and again as a member, sometimes as president, of courts-martial, he was a member of the most historical of all the military tribunals of the Revolution—the tribunal which tried and condemned Major André. In his habits he was, says his biographer, diffident and retiring; in his literary tastes, a man of varied accomplishments; as a lawyer he was sound, as a judge he was as just and conscientious in dispensing justice as he had been faithful and efficient in his military career.

The author has, of course, found it difficult to give unity to a volume which is partly biographical, partly historical, and partly genealogical. And there are signs of haste in its compilation. The binder of the book has misplaced the cut which exhibits one of the basreliefs on the battle monument at Freehold, in Monmouth County, N. J., and the author misstates in saying on page 106 that this monument is situated at Hopewell, N. J., where the military council was held which led to the battle at Monmouth. This is, of course, a slip of the pen. It is hardly accurate to say that the resolution of the Continental Congress recommending the colonies to establish new forms of civil government after the royal authority had practically lapsed throughout the continent was passed on the 15th of May, 1776. The resolution was passed on the 10th of May. It was only a preamble to it which was passed five days later. The biographer becomes obscure by being brief when he says that Gen. Paterson, as a member of the Massachusetts Provincial Congress, assembled in its third meeting, "was instructed on the 14th of February, 1775, to bring in a resolution to appoint an agent to go to the Province of Quebec and collect the sentiments of the people there relating to the matters which disturbed the harmony existing between the mother country and her colonies"; that "John Brown was made this agent"; and that "the news which he brought back resulted in the disastrous Canada campaign, which was undertaken under the impression that Canada, like the other colonies, was dissatisfied, and was both likely and willing to join the other colonies in defence of their rights."

The historical facts are that, a month or more before this Congress met, the Massachusetts Provincial Congress of November, 1774, had appointed a committee "to devise means of keeping up a correspondence between this province, Montreal, and Quebec," for the sake of gaining frequent intelligence about the movements in Canada; and persons no less distinguished than John Hancock, Samuel Adams, and Dr. Joseph Warren were made members of this committee. It is true that Gen. Paterson, on the 13th of February, 1775 (not "the 14th of February," as Prof. Egleston writes), was "instructed" to bring in a resolution to appoint an agent to go to the Province of Quebec, but his motion to this effect did not pass. It was recommitted, and he was then instructed to bring in a resolution "empowering the Committee of Correspondence of the Town of Boston to correspond with Quebec, etc., for and in behalf of this province." This resolution was reported and passed on the next day.

It is quite erroneous to suppose that the military operations conducted by the colonies against Canada "resulted" from the news which John Brown sent back to the Boston committee of correspondence. As the place which Canada held in the political and military strategy of the early Revolutionary period seems to be as little understood by Prof. Egleston as it was by Dr. Stillé in his 'Life of Anthony Wayne,' we shall perhaps be pardoned if we seek to set this matter in what seems to us its true light.

Any one familiar with only the speeches of Edmund Burke on the parliamentary taxation which led to the Revolution, will remember that the whole change of ministerial policy in the matter of such taxation dated from the conquest of Canada by Great Britain, and was caused by it. "The first glimmerings of the new colony system began to dawn," Burke tells us, immediately on the close of the war which resulted in the conquest of Canada from the French, with its consequent unification of all the Atlantic colonies under British authority after the Treaty of 1763. At that period, he adds, "the necessity was established of keeping up no less than twenty new regiments, with twenty colonels capable of seats in the House of Commons," not at all because of any further danger from foreign attempts against the peace of the colonies, but simply in order to keep the colonies in subjection to the mother country. Then it was, says Burke, that Townshend began to dazzle the country gentlemen of the House, "great patrons of economy," with "the image of a revenue to be raised in America." The colonists took note of this change, and of the motives which had led to it. William Samuel Johnson, the Colonial Agent of Connecticut, wrote from London to Jonathan Trumbull in June, 1767, that too many of the British rulers at that time "seemed to indulge haughty ideas of empire, and [to think] that America should be made entirely subservient to the dignity, plunder, and general emolument of this country."

The leaders of the American Revolution were well advised of the part which the conquest of Canada had had in precipitating this change of colonial policy. John Adams refers to the fact again and again, not with more clearness than others, but perhaps with a more emphatic iteration. As Canada was designed to be a *point d'appui* for the support of the ministerial policy in asserting British parliamentary supremacy over all the colonies south of it, and as Canada could easily lend itself to the support of such ministerial supremacy because

of its dominating position, and because the Indian tribes of the North and Northwest could be wielded from that position for the intimidation of the provinces southward on the Atlantic border, it was seen at once that as Canada had become the key of the new political and military strategy of Great Britain for purposes of offence, so Canada must be made the key of political and military strategy in the hands of the early Revolutionary leaders for purposes of defence. So clear was this position of Canada, whether for purposes of offence or defence at this juncture, that we find Dr. Samuel Johnson hinting with a caustic sneer in his Tory pamphlet of 1775, 'Taxation no Tyranny,' that the British Ministry might see the refractious colonists brought "at their feet" by restoring Canada to the French (that the colonists "might have an enemy so near them"), and by "encouraging the Indians now and then to plunder a plantation." He recognized this caustic proposal to be a "wild" one, but it was, he said, no wilder than the idea that Americans should not be governed and taxed for Great Britain's benefit, after Great Britain had fought and conquered for their safety from French domination in Canada.

On the 22d of October, 1775, we find Richard Henry Lee writing to Gen. Washington: "Before this reaches you, you will have heard of Col. Allen's unlucky attempt upon Montreal, nor have we from the last accounts much prospect of success from St. John's. The ministerial dependence on Canada is so great that no object can be of greater importance to North America than to defeat them there. It appears to me that we must have that country with us this winter, cost what it will." And a few days later, October 26, 1775, we find Gen. Washington writing to Gen. Schuyler, as he was moving to the support of Gen. Montgomery: "The more I reflect upon the importance of your expedition, the greater is my concern lest it should sink under insuperable difficulties. I look upon the interests and salvation of our bleeding country, in a great degree, to depend upon your success." Moreover, the conquest of Canada was deemed essential to protect the natural right of the New England colonies to the fisheries in the Northeast—a right which had to be protected by stipulation in the Treaty of Peace of 1783, after it had failed to be protected by right of conquest in the Revolutionary war.

How all these strategic and economic reasons in favor of the conquest of Canada were intensified by the passage of the Quebec Bill (a bill which had for its object, as the Continental Congress charged, to substitute the institutes of French customary law for the common law of England, and thereby "to make Canadians proper instruments for assisting in the oppression of such as differ from them in modes of government and faith"), is matter of too common knowledge to call for more than mention. Just as little need we more than mention the difficult and ambiguous rôle which the Revolutionary agitators were called to play when, in their addresses to the people of Canada, they invited friendly coöperation, while in their Address to the people of England they inveighed against the Quebec Bill because, in reëstablishing the Roman Catholic religion in its ancient rights, that bill, they said, had reëstablished a religion "fraught with sanguinary and impious tenets." That the Roman Catholics of Canada could not contain their resentment, and broke out in curses on what they called "a perfidious and double-faced Congress," when they read this address in the translations distributed among them, we may see in the letters of that day (Force's Archives, vol. ii., p. 231). John Brown was far from being always over-sanguine in his reports, whatever he might write to Gov. Trumbull or others. He wrote to the Boston Committee of Correspondence on the 29th of March, 1775, that there was "no prospect of Canada's sending delegates to the Continental Congress." We know from the minutes of the Continental Congress that others than John Brown brought reports from Canada direct to that body. How little John Brown had to do with procuring or even precipitating the campaign against Canada in 1775 and 1776 might have been inferred from the fact that the Continental Congress revived the whole project of "the emancipation of Canada" in 1779, discussed at length with Gen. Washington (through a select committee raised for the purpose) the military combinations which might then be deemed essential to that end, and abandoned the enterprise only with great reluctance, while still pledging themselves to "embrace with alacrity every favorable incident which should facilitate and hasten the freedom and independence of Canada, and her union with these States."

Prof. Egleston gives a whole chapter to the history of Shays's Rebellion and of the part which Gen. Paterson took in its suppression. We entirely concur with the author in holding that the conduct of Paterson was not blameworthy because at one time, in the course of his operations, he promised some of the insurgents that if they would disperse they might remain peaceably at their homes, and, if tried at all, should be tried in their own counties. Gen. Lincoln, the commander-in-chief of the State militia, had promised as much to certain insurgents whom he had paroled, and this proceeding of his was subsequently approved by the State Legislature. Perhaps Gen. Paterson, in the reaction which followed the rebellion, was blamed because he had not lived up to a threat contained in a postscript to one of his letters addressed to Gen. Lincoln from Lanesborough, in which, under date of February 5, 1787, he had said that if he should judge it practicable to attack the insurgents in Berkshire County with a probability of success, he would not "wait the determination of the General Court that they are in a state of rebellion, but would consider them as such and act accordingly." By thundering so loud in the index, he made it a little difficult for himself to defend his lenity, and to show the consistency with which he had practised it on "rebels" who, without his knowing it, had been formally declared such just one day before he launched this menace at them in the despatch to his commander.

We may say, in closing, that Gen. Paterson in one of his letters during the Shays Rebellion uses a word which is new to us. Writing about what seemed to him a better political outlook in the early part of 1787, he says: "I most sincerely congratulate you on the happy prospects which are before us in the *aristocration* of legal and constitutional government." The biographer, too, takes liberty with both history and philology when, in describing the sufferings of our troops in Canada from smallpox in 1776, he uses the word "vaccination" as convertible in meaning and currency with the word "inoculation."

---

*The Animal as a Machine and a Prime Motor*, and the Laws of Energetics. By R. H. Thurston. John Wiley & Sons. 1894.

In this little book Prof. Thurston pursues that way of attacking the Second Law of Thermodynamics (or, as he prefers to call it, the Law of Carnot) which is his own. That law is that heat flows from hot bodies to cold, as water runs down hill; so that when bodies are all cooled down to one level of temperature, the heat in them above the absolute zero is no more available to run an engine than is the height of the sea above the centre of the earth available to turn a water-wheel. At one time great ingenuity was expended to discover some exception to the Second Law of Thermodynamics; but the only exception which withstood examination was the hypothesis of Maxwell. Maxwell supposed a diaphragm in a vessel to separate two portions of air; and that in this diaphragm was a little sliding door at which should sit a tiny doorkeeper who should look out for the very fast-moving molecules coming one way and for the very slow-moving ones coming the other way, and open the door for these and for no others. In that way the air on one side would become heated, and that on the other side cooled. It was the first time an advantageous route for science had been found through fairy-land; and when it was further remarked that, by replacing the little door by a lobby with two doors and putting a fan-wheel in the lobby, an engine could be run directly, the analogy to the running of a water-wheel by the gravitational energy of the ocean became striking. Prof. Thurston considers our inability to use the great heat above the absolute zero of ordinary objects to be a shocking waste; and one of the chief purposes of this little book is to adduce evidence that living animals are machines in which the Second Law of Thermodynamics is "evaded." Inasmuch as he says the Law of Carnot "asserts the necessity of waste," and further says this waste does not take place in the living machinery, perhaps "violated" would have been a clearer word than "evaded."

Prof. Thurston certainly succeeds in showing that, accepting extant experiments upon animals (and they are both elaborate and numerous) for what they may be worth, they distinctly point towards some violation of accepted laws of energy. Thus the careful experiments of Hirn showed that more heat by a third part was generated by the human body than the combustion of food would account for. Moreover, when Hirn compared the amount of work a man performed with the reduction of the heat generated while he was at work below what was generated at the same time while he was at rest, he obtained a result which Prof. Thurston argues is contrary to accepted laws of thermodynamics. "The animal system," he says, speaking of it as a motor, "conceals some secrets that science has still to discover." Dr. Pavy's well-known experiment on two pedestrians is also cited to show that "the body as a heat engine is capable, apparently, of performing more work than the food would seem competent to do." Dr. Austin Flint failed to explain from known physical principles the results of his experiments upon the pedestrian Weston in a walk of 310 miles.

Prof. Thurston's conclusion is, not that there is any inaccuracy in the law of the conservation of energy, which rests with him upon metaphysical grounds, but that the Law of Carnot is somehow "evaded." If the mechanical conception of the universe, that all that exists is expressible in terms of mass, space, and time, upon which Helmholtz rested his celebrated enunciation, be accepted, it is known that the "Law of Carnot" follows as a corollary. By the majority of physicists the alternative will be felt to be either, on the

one hand, to suppose that all the observations that have been made upon animals are subject to a common error, due to the same cause, whatever that may be; or, accepting the experimental evidence, to conclude that the law of the conservation of energy is not exactly fulfilled in living animal bodies. The Law of Carnot was enunciated long before the law of the conservation of energy, and, if it be regarded as the assertion that the average motions of the different parts of a system tend to equalize themselves or to approach final ratios, is incontestably quite as certain as the law of energy.

Prof. Langley has recently taught us how one of the great wonders of the animal world —that of the soaring bird—is performed. Now, if we are to take his successful explanation as a model by which to explain other animal marvels, it must be confessed that the way the bird turns this way or that way to take advantage of the lulls and puffs of the wind, is not unlike the opening and shutting of the doors of Maxwell's devils, thus affording some comfort to Prof. Thurston. The book has, at any rate, the merit of calling attention to one of those residual unexplained phenomena in the patient study of which, not in blind denial of them, the progress of science consists.

---

*Crumbling Idols.* By Hamlin Garland. Chicago and Cambridge: Stone & Kimball.

In these twelve essays, dealing with art, literature, "and the drama," Mr. Garland recites his credo to whosoever will listen. Its articles have two broad divisions—the renunciation of the past and all its works, and the belief in what is to come out of "the mighty spaces of the West" and its "swarming millions of young men and women." Veritism is the name in which devils are to be cast out, and the artist himself is to be a veritist, to whom the "satyriasic French novelist" will be anathema maranatha no less than the "blind fetishism, timid provincialism, or commercial greed which puts the work of" the masters "above the living, breathing artist." Shakspere, in fact, "lies, sunk and sinking, just as every other human soul sinks into the sand." And, again, "Shakspere, Wordsworth, Dante, Milton, are fading away into mere names—books we should read but seldom do." Yet their spirits have not departed into an unpeopled limbo, for even "the veritist and the impressionist will try to submit gracefully to the method of the iconoclast who shall come when they in their turn are old and sad." These things being so, is it a sign of narrow consistency if the reader ask, Why, then, say elsewhere that "the surest way to write for all time is to embody the present in the finest form with the highest sincerity and with the frankest truthfulness"?

"Contemporaneousness," one finds, is the white robe of Mr. Garland's artistic faith, and mediocrity its palm branch, for "our national literature will come to its fulness when the common American rises spontaneously to the expression of his concept of life," and in that day "there will be no overtopping personalities in art," nor ever again "will any city dominate American literature." Instead, the real novelist of the elect sections "is walking behind the plough or trudging to school in these splendid potential environments," while "the novel of the slums must be written by one who has played there as a child, and taken part in all its amusements; not out of curiosity, but out of pleasure-seeking." And finally, from the "interior spaces" of the West comes the confession, "We propose to discard your nipping accent, your nice phrases, your balanced sentences, and your neat proprieties inherited from the eighteenth century. Our speech is to be as individual as our view of life."

Mr. Garland has written both prose and verse wherewith to illuminate his creed, and by them it should be judged no less than by its naked enunciation. The practice of most men is notoriously better than the worst of their dogmas, and Mr. Garland will not be found an exception to the rule. If one might venture to advise so bold and confident a spirit, it would be to make, in the name of the breadth he now and again eloquently advocates, yet another essay of the culture at present pronounced by him sterile, false, and dying.

BOOKS OF THE WEEK.

Academy Architecture. 1894. Scribners. $2.
Bates, Arlo. The Torch-Bearers. Boston: Roberts Bros. 50 cents.
Clark, J. W. Libraries in the Medieval and Renaissance Periods. Macmillan. $1.
Dunning, Rev. A. E. Congregationalists in America. J. A. Hill & Co. $2.75.
Emmet, W. Le R. Alternating Current Wiring and Distribution. The *Electrical Engineer*.
Forney, M. N. Political Reform by the Representation of Minorities. The Author.
Gardner, Sarah M. H. Quaker Idyls. Henry Holt & Co. 75 cents.
Hobson, J. A. The Evolution of Modern Capitalism. London: Walter Scott; New York: Scribners. $1.25.
Lee, Sidney. Dictionary of National Biography. Vol. XXXIX. Morehead—Myles. Macmillan. $3.75.
McCrackan, W. D. Romance Switzerland. Teutonic Switzerland. 2 vols. Boston: Joseph Knight Co.
Nitti, F. S. Population and the Social System. London: Sonnenschein; New York: Scribners. $1.
O'Neill, Moira. An Easter Vacation. E. P. Dutton & Co. $1.25.
Pinkerton, Percy. Adriatica. London: Gay & Bird.
Rawnsley, Rev. H. D. Literary Associations of the English Lakes. 2 vols. Macmillan. $4.
Saunders, Bailey. Life and Letters of James Macpherson. London: Sonnenschein; New York: Macmillan. $2.50.

HENRY HOLT & CO., N. Y.,
*Have Just Published:*
DURUY'S MODERN TIMES.
(1453-1789.)

Translated and edited by Prof. E. A. Grosvenor of Amherst and Smith Colleges. A sequel to the author's *Middle Ages* (uniform in price and style). A rapid sketch of European life, from the fall of Constantinople to the French Revolution. Many minor facts have been eliminated, to make the great events stand out boldly and clearly. President Charles Kendall Adams says: "It is doubtful if any single volume on the period of which it treats can be of so much value to the student." xvi+575 pp. 12mo. Teachers' price, $1.60. Postage, 14 cents.

NEW ED. WITH GRAMMAR OUTLINE OF
BRIGHT'S ANGLO-SAXON READER.

Teachers' price, $1.75. Postage, 11 cents.
"The best book of its kind by far."—*Prof. Flügel of Leland Stanford, Jr., University.*

HUNT'S CONCRETE GEOMETRY FOR GRAMMAR SCHOOLS.

The definitions and elementary concepts are to be taught concretely, by much measuring, by the making of models and diagrams by the pupil, as suggested by the text or by his own invention.
100 pages. Boards, 30 cents.

D. C. HEATH & CO., Publishers,
BOSTON, NEW YORK, CHICAGO.

*A DESCRIPTIVE CATALOGUE*, giving Contents and Critical Opinions of the 528 books from Houghton, Mifflin & Co.'s List included in the Model ("A. L. A.") Library exhibited at Chicago, will be sent to any address. 4 Park St., Boston.

KINDERGARTEN SUPPLIES
*at Schermerhorn's, 3 East 14th St., N. Y.*

Yale Mixture.
A GENTLEMAN'S SMOKE.
You won't know the luxury of Pipe-Smoking until you use Yale Mixture.
A two-oz. trial package, postpaid, for 25 cents.
MARBURG BROS.,
The American Tobacco Co, Successor,
Baltimore, Md.

THE LENOX LIBRARY
(AND READING ROOM),
Fifth Ave. and 70th St., is open every weekday from 10 A. M. to 5 P. M..
Exhibition of rare books; two galleries of paintings.
Admission free; no tickets required.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies: also make collections and issue Commercial and Travellers' Credits, available in all parts of the world.
Brown Brothers & Co., Bankers,
NO. 59 WALL STREET, NEW YORK.

*History of Dartmouth College*
AND THE TOWN OF HANOVER, N. H., by Frederick Chase. Vol I. To the outbreak of the college controversy. Large 8vo, cloth, $3.50, net; postage 24 cents. Sent on receipt of price by
JOHN K. LORD, Hanover, N. H.

TO RENT FOR THE SUMMER.
A cottage at Onteora, Catskill Mountains. One large room with north light, suitable for an artist. Apply to Miss Stearns, Onteora, Tannersville, Greene Co., N. Y.

*A Tonic*
*For Brain-Workers, the Weak and Debilitated.*
Horsford's Acid Phosphate
is without exception the Best Remedy for relieving Mental and Nervous Exhaustion; and where the system has become debilitated by disease it acts as a general tonic and vitalizer, affording sustenance to both brain and body.
Dr. E. Cornell Esten, Philadelphia, Pa., says: "I have met with the greatest and most satisfactory results in dyspepsia and general derangement of the cerebral and nervous systems, causing debility and exhaustion."
Descriptive Pamphlet free.
*Rumford Chemical Works, Providence, R. I*
Beware of Substitutes and Imitations.

## William Lloyd Garrison,

1805–1879.

The Story of his Life told by his Children. Illustrated with over 40 portraits, views, etc. 4 vols., 8vo, gilt top, $8.00 *net*.

This important work (till recently published by the Century Company), has been reduced in price from $12.00 to $8.00, a remarkably low price for what is unquestionably one of the handsomest products of the American press.

"A biography of almost world-wide importance. . . . It will be a standard work of reference."—*Charleston News and Courier*.

"In fact, Southern history is not complete without this work."—*Atlanta Constitution*.

"It is, for the anti-slavery record, final; and the service done to our national history is as great as that to a father's memory. Its one eminent trait, however, is its justice."—*Atlantic Monthly*.

"A masterpiece of modern historical biography. . . . To call the work a mine of information would be to convey a false impression: it is rather a well-arranged library in which attendant hands are always present to point the way to the exact thing wanted. . . . Finally, the work, while as instructive as the driest manual, is as interesting as a romance."—*Boston Advertiser*.

## School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

The *Nation*, in its special field of political and literary criticism, is unlike any other periodical, American or foreign. At least 10,000 copies are circulated weekly, but these figures do not accurately represent the number of its readers. It is taken by reading clubs and literary associations in a large number of places, and may be found on file in every library of importance in the country. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters.

Advertising rates, 15 cents a line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 208 Broadway, N. Y.

## CASS REALTY CORPORATION.

Incorporated under the laws of the State of New York.

Capital invested only in productive real estate in the city of New York.

This Corporation is organized for the purpose of providing a safe and profitable method of investing money for persons of limited means, and it is believed that no safer or better way can be found than in the purchase and holding of well-located and productive real estate in the city of New York.

The Capital Stock is divided into Common and Preferred shares of the par value of one hundred dollars each.

The Preferred shares are entitled to dividends at the rate of five per centum per annum, payable quarterly, and to a preference for principal.

The investor has the advantage of knowing that the property of the Corporation is always in sight and can be readily located and inspected, that its value is permanent and easily ascertained, that the income is certain.

For people who seek safety and permanence, together with a moderate return, this investment recommends itself.

Common and Preferred shares are now offered at the par value of ONE HUNDRED DOLLARS each, in large or small amounts. Payments may be made in installments.

Application must be made to

**Cass Realty Corporation**

# The Nation.

*NEW YORK, THURSDAY, JULY 26, 1894.*

## The Week.

THE letter of President Cleveland to Chairman Wilson was both timely and just. Mr. Cleveland had a perfect right to send it to Mr. Wilson. Mr. Wilson had an equal right to read it in the House or to send it to the clerk's desk to be read if the House was willing. The Senators, each and all, have the equal right to vote for or against the President's views. This is a comprehensive statement of the case, and it cannot be considered as alarming in any point of view. Nor can it be said that "undue pressure" has been brought to bear on Senators by the President. Our history does not show the existence of danger to liberty in that quarter. As a matter of fact, the sayings of a President are of little avail with Senators or Representatives unless those sayings find a response among the constituencies. Probably Mr. Cleveland's desire and intention were to awaken such a response, and he has succeeded in doing so.

---

Senator Gorman has "freed his mind," and it is to be hoped that he feels better for it. Certainly he has done no harm to the cause of tariff reform by his passionate outburst of Monday against Mr. Cleveland. The Maryland Senator deceives himself greatly if he supposes that the people are going to pay much attention to a controversy as to the President's attitude toward the forced compromises in the tariff bill while the matter was pending in the upper branch of Congress. The country has studied the career of Grover Cleveland for a dozen years with the utmost care, and long since made up its mind in regard to him. The one charge which it is most ridiculous to bring against the President is that of disingenuousness, duplicity, and deceit. It is a mere waste of words for Gorman to try to convince the public that Cleveland deliberately misled Senators as to his attitude. He might as well set out to demonstrate that he himself is a statesman whose sole aim has always been the public interest.

---

There is no higher authority on constitutional law in the United States than Judge Cooley of Michigan, and President Cleveland may well feel proud to receive an expression of the "unqualified satisfaction" which he feels with every step taken by the executive in vindication of the national authority during the recent crisis. Judge Cooley is of the opinion that "a great and valuable lesson in constitutional construction has been settled for all time." There can be no dissent from this view. The President's course has been formally endorsed by each branch of Congress almost unanimously, and it has been sustained by an overwhelming majority of the people in every part of the country. It was practically a new issue in the administration of the national government, and the executive was called upon for a decision as to the proper construction of the Constitution. It is fortunate for the future of the United States not only that Mr. Cleveland's decision was right, but that it has been promptly and universally accepted as right. As Judge Cooley says, a great issue has been "settled for all time."

---

An extraordinary lot of jargon comes from the mouth of Gov. Hogg of Texas, indicating that Senator Gordon, as the leader of the Loyal Confederate Legion, ought to have an eye on him. According to the *World's* report of a militia review at Austin last week, the Governor was in very low spirits as to the future of the nation. President Cleveland's action in sending troops to Chicago without the sanction of Gov. Altgeld had gone far, he thought, towards the dismemberment of the Union. We were on the eve of a revolution if such things should go on. "In that event," he said, "I want to see Texas fall on her feet, and live under her old Constitution of 1836 as a republic." There are several obstacles to this dénouement. One is, that General Gordon, with his army of Confederate veterans larger than Lee ever commanded, would march to Texas and bring the Lone Star back to the place where she belongs and perhaps hang Governor Hogg on a sour-apple tree. Another is, that the Texans themselves don't want to "fall on their feet and live under the old Constitution of 1836." They want to stand on their feet and live in the American Union, whether President Cleveland sends troops to Chicago or whether he sends them to Austin —and he would as soon send them to the latter city as to the former.

---

All the Hoggs in Texas are not Governors. One of them is a professor, and he introduced resolutions at the recent State Teachers' Association calling for a systematic course of instruction in the schools "which shall embrace not only a broader patriotism, but a more extended moral instruction, especially in regard to the rights and duties of citizenship, the right of property, the security and sacredness of human life." He rightly maintained that the ideas on these subjects which got into the heads of the 25,000,000 school-children of this country would come out when they became citizens, and that if they are to disapprove of the open defiance of the rights and security of property, their education on the subject cannot begin too early. His resolutions were not adopted, but were commended to the attention of the National Educational Association. Superintendent Hogg of Fort Worth seems to be right on the trail of Gov. Hogg of Austin.

---

The latest batch of riotous boycotters to be indicted at Chicago were released on bail, and their bail-bonds were signed by city officials. This is but one more proof of the sympathy of the city authorities with the violent strikers. It is no wonder that the power of the mob was so desperate in a city so governed. The anarchist vote is still thought to be worth angling for in Chicago. We shall see men running for city offices at the next election on a platform of the city for strikers, no troops, and death to employers who will not arbitrate. There is no likelihood of success on such a platform, any more than there was in the attempt to beat Judge Gary for having tried and condemned the Haymarket anarchists. The sentiment of the city is no doubt overwhelmingly on the side of law and order. But the strikers and the agitators make so much more noise than the respectable folks that your stupid politician runs after the rioters, and then is surprised when the people read the riot act to him as well as to them.

---

"President" Debs has issued his proclamation to the people of the United States urging them not to ride in Pullman cars. The object of this is twofold: first, to carry out the boycott that Debs attempted to enforce but could not; second, to express the sympathy of the American people for rioters and incendiaries, law-breakers, and train-wreckers. It is safe to predict that so long as Debs's desperadoes are attacking trains and turning switches and loosening rails, those people who must travel will ride in Pullman cars, because they are 50 per cent. stronger and safer than ordinary cars. Apart from this consideration, it is quite certain that all but the merest fraction of those who can afford to ride in Pullman cars will do so to show their abhorrence of mobs, if for no other reason. The outburst of approval of President Cleveland's action in sending troops to Chicago to suppress Debs and raise his blockade, is a sure sign that the only boycott which meets public sympathy is that which the railroads are applying to the villains who are throwing stones through car windows, and sawing bridge timbers, and displacing rails and switches.

One thing about the Pullman situation that seems to stick in the crops of a great many people is the fact that the company did not lower rents when it was forced to lower wages. Mr. Pullman's statement of facts in regard to the car-building business—a statement fully confirmed by his competitors—has stilled fault-finding on the score of reduced wages. The men earned less, but the company earned nothing. That is admitted; but people say, "Yes, but the company is not only a car-builder, it is a landlord as well, and should have lowered rents when it did wages." Now, what are the facts? About two-thirds of the Pullman employees do not live in the company's houses at all. They have homes in Roseland and other adjoining places. Rents there are as high as in Pullman, accommodations and conveniences considered. So if the company had lowered the rent of the one-third of the employees on the premises, it would have been bound, in justice, to make an equivalent present to the other two-thirds. Then what would the neighboring landlords have said at such a cutting under the ruling rentals? They would have had a grievance, and in accordance with strict "ethical concepts" would have had a just claim on the Pullman Company for a sum equal to their diminished receipts. In short, there would have been no end to the absurdities and injustices which would have resulted from any such attempt to make up to the men in rent what they were losing in wages. There would have been just as much reason in asking the local butcher or grocer or clothier to knock off one-quarter of his prices on account of a reduction in wages. When we add the fact that no workman was compelled to stay in Pullman, and that the company was actually $70,000 behindhand in rents due from employees, we see how little there is in the whole contention.

---

The statement of the law relating to strikes, made on Wednesday week at Indianapolis by Judge Baker of the United States Court, deserves general attention. The case before him was that of a striker accused of contempt of court in violating an injunction, and Judge Baker laid it down flatly that it was contempt of court for any body of men to engage in a combination "to strike and to interfere with anybody else who goes to work, and to denounce them as scabs." A request under such circumstances, Judge Baker said, was equivalent to a demand, and he added, with great plainness and vigor:

> "If in the night time some highwayman should step up and say, 'Please give me your purse; I will thank you to do it,' notwithstanding the politeness of his language, I should understand it as a threat. And so when a member of a strike committee, with an angry mob behind him of strikers, clothed with authority, should say to some other man in the employ of the road: 'Please, now, don't you think you ought to come out?' the court understands it as a threat. It is the highwayman's politeness; it means that life will be made miserable for him if he refuses, that they will do what they did out here at Fontanel—break switch-locks, and hurl innocent men to death. That is what it means. They talk about being peaceable. Every one that has any sense at all knows that a strike would not amount to anything unless they follow it out by violence. They know that if they would do what they have a right to do, decently and orderly, go about their business and leave the employees alone, a strike would not amount to anything. They know it would absolutely fail."

---

These remarks of Judge Baker were apparently *obiter dicta*, and the question raised is of such far-reaching importance that it will unquestionably be carried to the Supreme Court of the United States for final decision. But it is greatly to be desired that the precise point involved should be kept free from all confusing elements, and that the attention of the public should be fixed upon it. The question is not of the right to strike; that, if not conceded, is at least not in issue. It is not of the right to combine to strike, although that question will require thorough consideration. The true question is, how far a striker may go in preventing his former employer from hiring another man to take his place, and how far a combination of strikers may proceed in the same direction. From another point of view, and altogether the higher one, the question is whether or no a man desiring to work shall be protected by the law against the threats and the violence of men who desire that he should not work. We hear much longing expressed for "industrial peace." It is upon the answer to this question given by the Supreme Court of the United States that industrial peace depends.

---

Judge Baker's decision in the case of the Lake Erie and Western Railroad Company vs. Bailey is the most comprehensive and exact statement of the rights of workingmen and the paramount rights of society that the labor troubles have given rise to. It stands in respect of judicial opinions on the same plane with Senator Davis's speech in public discussion. It is replete with sympathy for the poor man, but firm in its maintenance of the right of the state to exist. Society cannot exist unless the right of every man to labor and to enjoy the fruit of his labor is protected and upheld. "If society were overthrown," says Judge Baker, "and men turned back into conditions of anarchy, as they were in large measure during the dark ages, when power and force made right, the condition of the laboring man would not be bettered. If such were the condition of society, the man or the men with great intellectual power and great wealth would become the masters of the laboring classes, as in the dark ages, and the laborer would be little better than a slave." An assault upon life or property committed by members of a labor organization, he affirms, is just as much a violation of law, both human and divine, as one committed by a single individual against a traveller on the highway. "If they compel submission, it is robbery, because whoever compels me, by force or terrorism, to give up one dime of my money, or one dime's worth of my property, is equally guilty, whether it be the man who meets me on the street corner in the night time, or an organized band of strikers who take possession of my property and deprive me of its use."

---

But that is not the worst of it, says the judge. These combinations teach disregard and contempt of all law:

> "They make people think that human rights are of no value. They teach the fantastic and monstrous doctrine that a man who is hired to labor, and is paid for his work, has some sort of equitable right in the property of his employer, together with a right of perpetual employment. It has been said on the floor of the United States Senate that the laborer has a sort of equitable lien on the property of the man for whom he works, whose money bought the property, together with the right of perpetual employment. It may do for men that are reckless of the welfare of human society—who care nothing for its peace and good order—to imperil life, property, and liberty, and the perpetuity of our institutions by teaching such doctrines; but the judge who tolerates it ought to be stripped of his gown and be driven from the sacred temple of justice."

Truer words were never spoken from the bench.

---

Congress has been humoring "Labor" by passing what seemed to be a harmless sort of act, but there is already trouble about the new law. It provides that the first Monday in September, "being the day celebrated as labor's holiday," shall hereafter be a legal public holiday "in the same manner as Christmas, the first day of January, the 22d of February, and the 30th day of May are now made by law public holidays." In the first place, there is no act of Congress under which the days just mentioned are public holidays; they are made such by State laws. In the second place, the new law does not make it clear whether Congress intended it to apply to the District of Columbia alone or to the whole country. In the third place, the first Monday of September is not universally "the day celebrated as labor's holiday." The second State in the Union observes the first Saturday of September; and if the act just passed is of national application, Pennsylvania will have two labor holidays in the same week. The bill appears to have slipped through Congress without much notice, as a harmless sop to "Labor," but it will be necessary to pass another law to clear up the uncertainty and confusion caused by its hasty enactment.

---

The conduct of the Senate in insisting upon increasing the appropriation for the Department of Agriculture against

the recommendation of Secretary Morton, is as unprincipled as it is indefensible. Secretary Morton has distinguished himself by effecting very great economies in the administration of his department, in accordance with the principles and professions of the Democratic party, and he has the mortification of seeing his labors nullified by a mongrel majority of Populists, Republicans, and recreant Democrats, who propose to compel him to devote a million dollars to the extirpation of a single weed. The attitude of the Populist Senators is especially noteworthy as showing the insincerity of their professions of anxiety to relieve the burdens of the common people. The House of Representatives may with the greatest propriety make a vigorous fight upon this item.

---

The passage by the House of the resolution for a constitutional amendment providing that Senators shall be elected by the people was generally expected, but it is universally admitted that the matter will be shelved in the other branch. There will be little protest against such action by the Senate, for public sentiment has not yet become pronounced in favor of the change. The chief argument urged for the amendment is the claim that legislatures are subject to corruption and often to bad influences, and Congressman Everett of Massachusetts made a forcible reply to this when he said:

"Who choose the legislatures, Mr. Speaker? Where do those legislatures come from? They come from the people; they come from the very ones to whom you wish to intrust the election of Senators. I believe in the people; but I believe that if there is corruption in the legislatures, it must be because there are weak spots somewhere in the people that lead to this corruption. If there is corruption showing itself in the elections of the legislatures which choose the Senators, that corruption will show itself sooner or later in the popular vote."

When one sees a Peffer in the Senate, it is natural to think that the blame must lie in the method of choice; but when we find that the popular vote gave the same state a Lewelling for Governor, we perceive that there is no assurance of obtaining statesmen by any device.

---

Poor Secretary Gresham has done it again. After having so many times incurred the honest scorn of the newspaper Jingoes, he has now tried to please them by "reversing himself" and taking the nations by the ears in the heroic Blaine fashion, but only to find himself scorned and flouted worse than ever. To be sure, the basis for the scorn seems rather crumbly on investigation. He had grossly insulted Japan, it was clear, but the Japanese minister denies it, and says that he and his Government are well pleased with the course of the Administration in the Corean affair. This may be Oriental duplicity, however. It has that air. Other terrible features of the story look more kindly on examination. When the whole correspondence is published, the able editors may be the ones to have to reverse themselves. But that will not help Mr. Gresham. Reversed or going ahead, they are always able to make out that he is a blunderer and an ignoramus and a no-account American. He should have known better than to meddle with Corea. We read that a Japanese empress named Jingo attempted the conquest of Corea in the sixteenth century. Naturally her American descendants are touchy on that subject.

---

There is much interesting reading for the friends of liberty in Hawaii in the record of the proceedings of the Constitutional Convention for the day when it was decided to appoint a President for six years. A few timid souls objected. Delegate Emmeluth thought the convention had no right to appoint a President. Minister Damon said that to appoint a President in a convention called for another purpose "looked too much like a sharp move." Delegate Kahaulelio observed that it seemed as though "in Honolulu the people could not trust their representatives." Counsellor Smith favored going through the form of a popular election, on the ground that it would "look better abroad." But all these absurd views had no weight beside the argument set forth by Councillor Brown. Said he: "We have got things now in our own hands. Shall we loosen our hold in the slightest degree? We never know in this country what politics will bring forth. I advise holding on to what we are sure of, and taking no chances of losing it." He was strongly supported by Delegate Robertson, who pointed out what an "enormous temptation" it would be to the royalists to try to carry the election, if one were weakly conceded. He, too, thought it "better to take no chances." Delegate Vivas said that, with action like that, a fight would come sooner or later, as "stable government was not a possibility as long as such oligarchical proceedings were tolerated." But twenty-seven out of the thirty-six delegates decided to take no chances, regardless of how it would look abroad. President Dole himself, much to his credit, protested against the action, and affirmed that the convention "could not constitutionally appoint a President." But he accepted the office, nevertheless, and thus presents the curious spectacle of a President who confesses that he has no constitutional warrant to his title.

---

These deep mysteries of Hawaiian representative institutions we have in vain asked their official champions in this country to expound. They remain silent, but we get the needed light from a man on the spot. One of the truest and most forward patriots now in Hawaii, Mr. W. N. Armstrong, gives the true constitutional view of the situation in an article printed in the *Hawaiian Gazette* of June 15. He shows how "the necessities of the case demand an uncommonly strong central government with very large powers in the hands of a few," and then adds, with a noble disregard of how it will look abroad:

"This proposal is not 'democratic,' but is based on the necessities of the case. If we were here alone, very little government would be quite sufficient, because the true Anglo-Saxon does not require much government; each man rules himself. It must be distinctly understood that, besides ruling themselves, the whites must create a form of government through which they can rule natives, Chinese, Japanese, and Portuguese, in order to prevent being 'snowed under.' That is, we need two distinct forms of government made up into one form; one for ourselves and one for aliens, who outnumber us. That which may be quite sufficient for us, would probably be utterly insufficient for them if we wish to keep control."

---

A recent article by M. Paul Leroy-Beaulieu in the *Journal des Débats* is devoted to the "homestead." This word is now often heard in political discussions in France, and it seems that in their rather desperate struggles to do something to quiet social discontent, the French politicians have grasped at it as suggesting an American institution which they might utilize. M. Leroy-Beaulieu considers the matter with his usual ability, and points out that, taking the word in the sense in which it is used in the statutes granting Government lands to actual settlers, the institution would be in France an impossibility. He then examines the "homestead exemption" acts of the several States, and shows how completely they have failed to accomplish their purpose. They have had no effect whatever in fixing families to the soil, in making population permanent, in causing the transmission of property from father to son. Nor has the true purpose of this legislation—the protection of the wife and infant children—been attained. The power to encumber and to alienate being retained, the exemption act becomes utterly ineffective. It is said that in Seneca County, in the State of New York, there were forty declarations of "homestead exemption" within the two years following the passage of the act, about 1850; since which time there has not been a single one. As M. Leroy-Beaulieu says, it is idle to discuss the policy of trying an experiment in France which has so completely failed in this country; besides which, there are conditions in French institutions which would make the scheme incongruous. We must confess that it is rather surprising that the plan of rendering small homesteads actually inalienable has not received more attention in this country. It would be to a certain extent a return to mediæval conditions; but then, trade-unions are mediæval institutions, and they have been enthusiastically advocated by some modern reformers.

*A WASHINGTONIAN PRECEDENT.*

In the debate on Monday, Senator Gorman appealed to the authority of George Washington to shield the Senate against what he called executive dictation. George Washington's example is better authority than Senator Gorman's interpretation of his words. What Washington did is of more consequence than what Gorman said. We therefore propose to examine the record of Washington's first term of office, and of the first Senate of the United States, in order to see how far Mr. Gorman is justified in his appeal to history.

It will be useful, as a preliminary step, to ascertain what the Constitution says about the duties of the President towards public measures. Article 2, section 3, says:

"He shall, from time to time, give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient."

This does not restrict the President to an annual message. He can send messages every day of the session if he likes. He is not restricted to general principles. He can go into details to any extent. He is not limited in any way whatever either as to time or as to form or manner of communication. He can make his communications either in writing or in person. It is customary now for the President to communicate his views in writing in all cases, but that was clearly not the original conception or intention. Washington himself presided over the convention that framed the Constitution. His name is the first one appended to it. He was the first President elected under it. The Senate which sat during his first Presidential term contained eleven members of the Constitutional Convention. What they did not know about the spirit and meaning of that instrument we shall not be likely to learn from Arthur P. Gorman at the present time.

The outrage committed by President Cleveland within a few days past consists in writing a letter to the Hon. W. L. Wilson, a member of the House of Representatives, which that gentleman obtained leave to make public. The letter dealt with certain details of the tariff bill and gave the President's views concerning the same. Is there anything harmful in that? The Constitution says that he shall recommend such measures as he shall judge necessary and expedient. In this particular case he recommended them to the chairman of the House committee on ways and means—a very fit person to receive a communication of this sort. He might have sent the same letter, without the change of a syllable, to either branch of Congress or to both. If he had gone to the Senate in person and taken the Vice-President's chair and told the Senators all that he told Mr. Wilson, and then had waited to see them vote, he would have done no more than Washington did in the month of August, 1789, without exciting unfavorable comment among members who had sat with him in the Constitutional Convention. But if Mr. Cleveland had done this, Mr. Gorman and Mr. Vest and several other great constitutional lawyers would have been petrified with amazement and indignation.

The narrative of Washington's action in the case referred to is found in the diary of Senator Maclay of Pennsylvania, who kept a record of the proceedings of the first session, when that body sat with closed doors. Congress was then sitting in New York. On the 22d of August, 1789, President Washington, having a communication to make to the Senate concerning the Cherokee Indians, went to the Senate Chamber in company with Gen. Knox, secretary of war; the Vice-President, John Adams, vacated his chair and President Washington took it. He told the Senate what he had come for, and said that he had brought Gen. Knox along because he knew all about the business. The Indians had complained of harsh treatment by the people of North Carolina. The papers in Gen. Knox's hands would explain the situation more fully. Then the President handed a treaty of seven articles to the Vice-President and asked him to read it. He did so. There was so much noise in the street from passing carriages that the Senators could not hear it. So the Vice-President went back to the beginning and read the first article again and immediately put it to a vote. Hereupon Mr. Maclay suggested that, as the subject was of some importance, he would like to have the accompanying papers in Gen. Knox's hands read also. Here, says Mr. Maclay:

"I cast an eye at the President of the United States. I saw that he wore an aspect of stern displeasure."

The first article of the treaty was postponed, then the second, and then the third. Finally, a motion was made and carried that the whole subject be postponed till the following Monday. Then, says Mr. Maclay:

"As I sat down, the President of the United States started up in a violent fret. "'*This defeats every purpose of my coming here*,' were the first words that he said."

The whole story will be found in pages 122-125 of Mr. Maclay's book, and we commend it to the serious attention of Mr. Gorman and the other great constitutional lawyers who are impressed with the teachings of Washington, and are alarmed for the independence of the Senate.

*PLAYTHING LABOR COMMISSIONS.*

The strike now being over but for the sporadic bandits who keep on wrecking trains, it appears that the President will soon appoint the promised commission to investigate it, or "sit on the corpse." A common impression is that this commission is going to arbitrate something or other, or at least to offer to do so. This is because the law under which it is to act is known as the arbitration law of October 1, 1888. But the appointment of the commission is provided for in sections 6 to 11 of that statute, which were meant to cover a case like the present, where both parties to a "difference" will not agree to submit to arbitration. In such event a commission may be named by the President, "either upon his own motion or upon the application of one of the parties," to "examine the causes of the controversy, the conditions accompanying and the best means of adjusting it." The appointees have no power to decide or arbitrate anything, but shall report to the President and to Congress, and thereupon their "services [at $10 a day] shall cease."

From all this it is clear that all we shall get out of the inquiry will be a huge Government report which nobody will read, which will settle nothing and satisfy nobody. A striking example of the futility of such Government commissions is afforded by the recent bringing to a close of the labors of the English Royal Commission on Labor. Appointed by Lord Salisbury in 1891, it has taken testimony from all sorts and conditions of men and has sought contributions from the ends of the earth, with the result of having filled sixty-five blue-books, spent $250,000, and accomplished absolutely nothing. Some of the volumes and reports contain instructive facts and views, but they were all accessible beforehand. Many of them are loaded down with fantastic opinions and wild theories of cranks and revolutionaries, who were delighted at the chance to get into print at Government expense, but who are no more edifying there than when mouthing at street-corners or in socialist mass-meetings. By sound economists and by agitators alike, the commission is condemned as a gigantic failure.

Yet there is nothing more popular just now than commissions to investigate labor or silver. A Dutch commission on labor has been sitting since 1890, and has just published its twentieth volume. It would seem as if the design were to crush out all rational interest in the investigation. Men will say: "If we've got to read those thousands of pages before knowing the merits of the labor question, let us die in happy ignorance." A mere epitomized index to the English commission's publications fills more than 200 pages. What a warning that is to mortals to leave hope behind if they enter there! Yet the demand for commissions survives even such horrible examples. As far as the European governments are concerned, the principle

on which they agree to name a commission on labor or silver has been well described by the German economist Bamberger. He said that Caprivi's latest silver commission was very much like the advice of a physician to a hopeless invalid to go to the south of France: it interested the patient for a while, though it did him no good whatever, and relieved the physician. Lord Salisbury was hard beset by the Radicals in 1891. They wanted laws on wages and strikes and arbitration and heaven knows what. "No," said his lordship gravely, "I can't commit the Government to such measures just now, but I'll give you a labor commission." Thereupon there was great rejoicing in labor circles. Something was going to be done at last. Even the Tories saw that things could not go on as they were much longer. Well, the Labor Commission has come and gone, and things do go on as they did, and will continue to do so in spite of the sixty-five blue-books. Meanwhile, the patient has had something to occupy his mind for three years, and the physician has had a pleasant vacation.

For the complaining workingmen, on the other hand, a labor commission is a good deal like a plaything. It gives their leaders a splendid chance to air their views and get a respectful hearing from grave investigators, and be bound up and buried at Government expense. They will have nothing new to say to the Chicago commission. They will state their grievances and their ideas of what ought to be done, and then the Pullman people and the railway managers will give their side of the case and say what cannot be done, and then all will be printed and turned over to Congress, and nobody the wiser or the better. If the workingmen are pleased with that sort of thing, they are welcome to it. All we can say is, they are easily pleased. Erasmus Darwin's little boy used to get so tired half-way round the park that he could not possibly walk another step, and then his father would give him his cane to ride home, and he would gallop off in delight. If the strikers can be sent back to work equally happy with their commission, it is certainly wise to give it to them. But that it will ever prove any thing more than an expensive plaything there is no reasonable prospect.

### *THE NEW THEORIES OF WAGES.*

THE boycott and the sympathetic strike were not the only institutions that were badly damaged during the recent disturbances at Chicago. Anarchy in general received a blow more than sufficient to make up for the encouragement recently given it by Gov. Altgeld's pardons, and socialistic views and tendencies were severely nipped by public opinion. The position taken by the "ethical school" of political economists in regard to wages has had a great deal more to do than is commonly supposed with arousing discontent among wage-workers, and it is interesting to see how untenable this position becomes when examined in the light of recent events.

The gist of what used to be known as the "wages-fund theory" was that wages were paid out of previously accumulated capital. It was further laid down that, at any particular time, the amount of capital intended to be applied to the payment of wages was a fixed quantity. It followed from this that whatever tended to increase the amount of capital applicable in this manner was a good thing for those who earned their living by selling their labor. Provided their numbers did not increase in the same proportion as capital, their wages necessarily would increase. It was also a corollary that whatever induced people to devote a larger part of their wealth to productive enterprises, was advantageous to the working-classes. The expectation of profit, therefore, was the mother of wages.

When the "ethical school" took hold of political economy, the first thing they attacked was the wages-fund theory, and they succeeded, according to their statements, in "exploding" it. It was too mathematical in character for sentimental purposes. They said that all the theory amounted to was the identical proposition that with a certain dividend and a certain divisor you will get a certain quotient. Instead of this dry and heartless way of looking at things, they proposed to establish an "industrial partnership" between the workman and the master, in which the profits were to be divided in a more equitable manner than of old. The scientific basis assumed for this partnership was found in the doctrine that the workman's wages came out of the product of his industry. Thus, if a man was hired to build a boat, a certain portion of the boat, as fast as it was constructed, became ethically his, as the embodiment of his labor. In other words, workmen were rightfully entitled to a share in the profits of their labor; and when this doctrine became diffused among them—which it naturally did with great rapidity—they at once felt that they were suffering great injustice because this share was not larger.

The weak spot in the new theory was always the possibility of there being no profits, and we have never been able to discover that the ethical professors were willing to explain how this difficulty could be overcome. But the strike of the Pullman workmen throws the whole matter into the clearest light. The Pullman Company asserted positively that it was making no profits at all, even after it had reduced wages, and that therefore it would not raise wages. But the workmen said that that made no difference; that if the company could not pay wages out of its future profits, it must pay them out of its past profits. These profits had either been fixed in the business or had been distributed to stockholders as dividends; but that did not affect the demands of the workmen. Wages, they had been told, came out of profits, and they no doubt thought it immaterial whether these were present, past, or future.

In this, it must be admitted, the workmen exceeded their instructions; but this only makes it clearer how impracticable the theory of those instructions was. Just so soon as any strain comes, men naturally fly back to what is not only the common-sense view, but also the actual and necessary fact, that wages are paid out of accumulated capital. No doubt wages are paid because the capitalist expects to make a profit by paying them; but they must be paid in advance of the profit—before it is certain that any profit will be made, or, if any, how much; and they remain paid although the whole capital is lost. They are sure; profit is contingent. It is because of this that profits require to seem large in order to tempt capitalists to make investments. They know that they may have to expend large sums in wages before they get any return, and that perhaps they may never get any return. Into such a partnership as this workmen cannot enter, although it may be for the interest of the capitalist to share the profits with them, when he makes any.

The "ethical" theory thus crumbles away when it is put to the test of experience. It would require that the employees of the Pullman Company should now work for nothing, for that would be about their share of the present profits of the concern. On the other hand, if the sounder theory of wages is adopted, everything is made to depend upon the accumulation of wealth and the expectation of profit, for the expectation of profit leads to the competition of employers for the services of laborers, and the possession of wealth makes this competition effective. The present condition of business is sufficient to make the folly of threatening investors and denouncing capitalists apparent. No better plan for keeping wages low can be devised than to assure the owners of wealth that, if they invest it, the control of it shall be taken out of their hands, and the proportion of it which they shall pay in wages be determined by other people.

### *CLUBS WITHIN THE CHURCHES.*

NO development of church life within the past ten years has been more striking than the rise and prominence of what may be called clubs within the churches. The Christian Endeavorers, with their gigantic annual meetings and membership wide as the world, are just now the most conspicuous organiza-

tion of the kind, but there are many others. A little hand-book lately printed by the *Congregationalist* gives a long list of church associations for men and boys, running all the way from the Young Men's Christian Association, founded fifty years ago, to the "Knighthood of King Arthur," organized only last year. The public is beginning to hear a good deal of the "Boys' Brigade," a church organization about four years old in this country, but already numbering 10,000 members. Then there are the well-known Episcopal "Brotherhood of St. Andrew," "Boys' Clubs," and "Men's Clubs," the "Men's Sunday Evening Clubs," and various others.

Of course, the obvious intent and main avowed purpose of these clubs is religious. They are organized as auxiliary to regular church work. "The Men's Sunday Evening Club," for example, was got up to help clergymen solve the distressing problem of the Sunday evening service. By having a club take charge of the service, and devise special programmes, and give particular attention to music, and induce the pastor to agree to preach short sermons, gratifying results have followed in certain churches, for a time at least. Others are more frankly social. Thus, the object of one "men's club" is said to be a monthly meeting "of the nature of smoke talks without the smoke." But this is an extreme case, it must be admitted, and most of the clubs in the list exist avowedly for the purpose of doing some kind of religious work in connection with the church in which they are established.

Yet there appears to be little doubt that their success and increasing members are due to causes not directly and explicitly religious. Novelty is the main charm in many of them, and no doubt some will disappear, as their predecessors did, after this attraction has worn away. To go to church or prayer-meeting simply may seem a stupid affair to many a young person who may be quite fascinated, for the time at any rate, by wearing a badge and belonging to a society with a mysterious set of initials. Doubtless many a boy is lured into church or Sunday-school by the uniform and military drill and summer encampments of the "Boys' Brigade," whom it would have been hard to catch by any of the staid old forms of public worship. But it is the social element which undoubtedly gives these organizations within the churches their great hold. They are peculiarly strong in country churches, and it is in country places that the social influence of the church is most felt and appreciated, and, we sincerely believe, needed. Nothing is more depressing about the decay of churches in New England hill towns than the corresponding decay of the social intercourse which once went hand in hand with the life of the churches. If the new church clubs can do what the old theology cannot any longer, and develop the social side of life in the very place where it most of all needs cultivating, it is no wonder that they are popular or are encouraged.

The deeper relations of such organizations, whether to the church or to society in general, invite a more thorough discussion than we can give here. Some persons see in them a perilous spread of the mania for organization, which, in the industrial sphere, has wrought so much evil, substituting the tyranny of the majority or of a few skilled leaders for the independent judgment of the individual. Clearer, perhaps, is the insidious danger to the Church herself—the historical Church, we mean a fountain of authority and channel of divine grace. There is no telling what these organizations which she is now warming in her bosom will do to her when they get their growth. After the "smoke talk without the smoke" may come the preaching service without the sermon. Indeed, the tendency at present decidedly is to let the smoke in and crowd the sermon out. The "Men's Sunday Evening Club" already insists upon a "short sermon." From that the step is not a long one to such an attraction as we recently saw advertised in the notice of an evening service in a country town, "Sermon omitted." That step taken, could the morning sermon long escape assault? Seriously, the teaching, authoritative function of the Church seems menaced by these clubs which are usurping so much of her time and strength; just as, on the other hand, her very welcome of their aid is a sign that she feels her grasp upon the affection and the conscience of men to be loosening. Meanwhile, there is no denying the extent of their power over the young people of the modern church. In the main they are doubtless liberalizing in their effect, and do much for the social life of those whom they most attract.

## FRANKLIN'S "EXPLANATORY REMARKS."—I.

BROOKLYN, July 21, 1894.

WHEN preparing my "Bibliography of Franklin" some years ago, I spent much time trying to unravel a sentence in a letter of Joseph Galloway's to William Franklin, dated March 30, 1764, in which he stated: "I enclose a Copy of your worthy Father's Remarks on our Assembly Resolves. No answer has yet been attempted by the Proprietary Faction, who seem much depressed."

A careful search failed to find these "Remarks," or anything that could be construed to be such, in any edition of Franklin's writings. Still, I could not but draw the inference from the quotation that it had been printed, for, though written sheets were often handed about from hand to hand in the colonial days as a way of disseminating political arguments, yet, had such been the means of circulation for this paper, it would hardly have been possible for the opposite party to see it, without which an answer on their part was not conceivable. I therefore made a careful examination of the columns of the two Pennsylvania papers published at that time for the whole period in which the publication could possibly have been made, but without finding it. From this I inferred that it was printed either as a pamphlet or broadside; but as correspondence and search in various directions failed to furnish the slightest clue to it, I did not feel justified in making a hypothetical title for inclusion in my list, and merely made a mental note of it as one of several Franklin *introuvables* to be watched for.

This led to my later discovery, in the English Rolls Office, of another allusion to the piece, in a letter from Gov. Penn to the Proprietors, which further convinced me that it had been printed at the time, but otherwise brought me no nearer to its discovery. Recently, however, I have been fortunate enough to purchase the piece. It is a folio broadside, of two pages, headed:

"EXPLANATORY REMARKS ON THE ASSEMBLY'S RESOLVES,
Published in the *Pennsylvania Gazette*, No. 1840."

Before noticing it, an outline of the political controversy which produced it may be of interest. The real matter at issue was of long and serious standing, having been practically the main political question for many years in Pennsylvania; but the supply bill passed by the Pennsylvania Assembly in the spring of 1764 was the immediate cause which precipitated new action on the part of the Assembly party in Pennsylvania. In June, 1763, Sir Jeffrey Amherst informed the Governor of the colony of the danger of the Indian outbreak later known as Pontiac's conspiracy, and asked an immediate calling of the Assembly to vote the troops and supplies necessary to quell it. Among other acts voted in pursuance of this was one granting "his Majesty the sum of fifty-thousand pounds," to which the Governor refused his assent, being bound by instructions from the Proprietors (*Votes*, v, 325-6). The Assembly at once appointed a committee "to draw up and bring in certain resolves upon the present Circumstances of this Province." A new supply bill was also framed, to which the Governor again refused his assent, and to which the Assembly resolved unanimously to adhere; and a message was drawn and sent to the Governor explaining the reasons for their action (*Votes*, v, 329-30). This in turn produced a message from the Governor and a counter-message from the Assembly, leaving each side determined to maintain its position. The committee on resolutions therefore promptly introduced (March 24, 1764) a series of resolves, which were at once published in the local press.

The resolutions so adopted were in effect an indictment of the proprietary government. But evidently Franklin did not feel that the mere vote, however unanimous, of the Assembly, asserting a series of facts was sufficient to cause conviction of the truth of the resolutions by the public. He accordingly prepared this series of "Explanatory Remarks," his prefatory paragraph stating:

"Resolves of Assembly being short Resolutions, formed after Debate and full Consideration of any particular Matter, they are generally very concise, and seldom contain the Reasons at large upon which they are founded; and although they are always so full and expressive as to be clearly understood by those who have attended to the Subject, yet, to enable others rightly to comprehend their Meaning an explanatory Account of the Facts seems

necessary. It is with this View the following Remarks are submitted to the Consideration of the Publick."

The remarks that follow, taken in connection with the original resolutions, constitute the most satisfactory party platform or statement of grievances I have yet found on the whole proprietary dispute in Pennsylvania. The paper is too long to print entire, but a few excerpts are worth making.

The first resolve practically states the view of the popular or Assembly party as to their relation to the Proprietors.

| RESOLUTION. | FRANKLIN'S REMARKS. |
|---|---|
| That it is the Opinion of this House, that the Proprietaries of this Province, after having delegated their Powers of Government, can be justly or legally considered in no other Light than as private Owners of Property, without the least Share or constitutional Power of Legislation whatever. | As this Resolve is the first in Order, so it is the most important, and is intended to point out the deepest Wound which has been made, by an undue Attachment to Proprietary Interest, in the original Constitution of this Government. By the Royal Grant, "free, full and absolute Power, is given to the Proprietary 'lieutenants and Governors,' to ordain, make, |

and enact Laws, for the Raising of Money, &c., according to their Discretion, with the Advice, Consent and Approbation of the Freeman of the Country, or of their Delegates and Deputies." The Powers of Legislature being thus fully granted by the Crown, to the Governor for the Time being, and the Peoples Representatives, 'tis evident the Proprietaries can have no Constitutional Share in Legislation, or Right to give Instructions to their Governor, whereby his "Discretion" must be totally destroyed. And therefore all such Instructions are a manifest Violation of the Royal Favour to the good People of this Province, and a most dangerous Invasion on the Rights of the Subject. They not only destroy the Exercise of Judgment in the Governor, but render the Representative Body of the People mere Cyphers in the Constitution. And vain is it for the People to send their Delegates to the seat of Representation, as all they can do when met, is to give up their Freedom and Exercise of Judgment, betray those very Rights they were sent to preserve, and servilely submit to Proprietary Will and Pleasure. Much better will it be for the Inhabitants of Pennsylvania to invest the Proprietaries with absolute Power at once, permit them to ordain and enact Laws at Three Thousand Miles Distance, and only transmit them here for Publication and Execution. For whose interest they will in that Case be calculated, and of what Spirit they will partake, modern Measures have fully demonstrated.

The second and third resolutions relate to the misuse of the proprietary power of binding governors from assenting to laws passed by the Assembly:

| RESOLUTIONS. | FRANKLIN'S REMARKS. |
|---|---|
| That the Obstructions and Delays the Measures of the Crown have so repeatedly met with in this Province during the late War, were solely owing to Proprietary Instructions, respecting the private Interest of the Proprietaries.<br>That all the Mischiefs to the Province, which the Governor mentions in his late Messages, as occasioned by those Obstructions, are therefore chargeable wholly to the Proprietaries. | The first Attempt to enforce this mischievous Claim, happened about Fifty Years past, when William Penn, in Governor Evans's Commission inserted a Clause reserving "to himself and his Heirs their final Assent to the Laws" which should be passed; and thus assumed the Royal Power, which by the original Charter was reserved to the Crown. How evidently does this demonstrate, that Men of the fairest Characters are not to be trusted, when under the Influence |

of private interest. A virtuous Opposition, however, both in the Proprietary Council, and Assembly, repelled this Invasion of their Rights, and the reservation was declared illegal and void. And from this Time Proprietary Instructions never appeared, till the Beginning of the late War. A Time when the Frontiers were bleeding in every Quarter, and the unhappy Inhabitants reduced to every Kind of Misery and Distress that the deepest Want, and the most relentless Barbarities of a savage Enemy could devise and inflict. This it seems was thought the most convenient Time to enforce those Claims, and reduce the People to a Subjection to them. And certainly a Time like this was necessary to their Success. For, upon their being laid before the Assembly, they plainly appeared to be formed solely with a View to increase the immense Wealth of the Proprietaries, and to oblige the People to bear their Burthens; and were found equally regardless of the Orders of the Crown, as of the Good and Safety of the distressed Inhabitants.

Influenced by these illegal Instructions, what unjust Claims have the Governors of this Province made in Favour of their Principals! They first insisted that the Proprietaries should not be taxed at all, although their Property was to receive equal Protection from it; then that their Quitrents should not be rated; next that their located and uncultivated lands should be exempted; and lastly that the Bills of Credit, issued as well for the Protection of their Property as that of the Inhabitants, should not be a Tender in the Payment of their Rents, contrary to all Justice and good Conscience. The Assembly, consistent with that Duty they indispensably owed to their Constituents, could not agree to these unjust Demands. This created Disputes; those Disputes created Delays, which greatly obstructed His Majesty's Measures; and whether the Proprietary Pretensions, or the Assembly's Opposition, were most just and well founded, is submitted to the Candid and Impartial.

Resolutions four to eight are in elaboration of the preceding, describing how the Governor had been placed under penal bonds by the Proprietors (in order that, like Governor Denny, he should not dare to depart from their instructions), and to the partial system of taxation which discriminated between lands held by the Proprietors and those owned by the colonists.

PAUL LEICESTER FORD.

# Correspondence.

## THE GREAT NORTHERN STRIKE.

TO THE EDITOR OF THE NATION:

SIR: In an editorial in your number for July 12 you unjustly charge the committee of St. Paul and Minneapolis business men who were called upon to assist in the settlement of the strike on the Great Northern Road with giving a decision in favor of the strikers upon a matter which was not submitted to arbitration as you claim. The agreement to settle by arbitration was made between the president of the road and the strikers May 1, and provided that the men were to be taken back without prejudice on account of the strike except certain ones. Had this been in writing, no question would have arisen. As it was, however, verbal, the committee was called upon two weeks later to give its understanding and recollection as to the exact exceptions made. The following are the exact words of the report of the committee upon this subject:

"It was agreed between Mr. Hill and Mr. Debs that all the employees of the company might return to their proper employment without prejudice for having taken part in the strike, except those men who had maliciously injured or destroyed the company's property, or were in the hands of the law. As no other exceptions were made, this committee is of the opinion that the men who abandoned their trains between stations, as claimed, however reprehensible such conduct may have been, have a right to be restored to the employment of the company under the terms of the agreement. The committee's interpretation of the meaning of the term 'those in the hands of the law' was, and now is, that the men in the hands of the law, if found guilty, should not be employed by the company in the future, but, pending the determination of their cases, they should not be excluded from employment by the company because of the charges brought against them."

The editorial in the *Pioneer Press* of May 14, a copy of which I enclose herewith, states the case correctly, and you must see that your article puts the committee in a false light. As one of that committee and a reader of your paper, I trust you will correct your statements made in the article referred to.

Yours truly, CHARLES P. NOYES.

ST. PAUL, MINN., July 19, 1894.

[Our implied censure of the committee really rested against the original agreement on the basis described by our correspondent, in terms differing little from our own.—ED. NATION.]

## PULLMAN AND ITS INHABITANTS.

TO THE EDITOR OF THE NATION:

SIR: While living at South Chicago, which is only a few miles from the town of Pullman, I had observed in conversation with men who had worked at that model town, and who had sought work in the Illinois Steel Works at South Chicago, a feeling of discontent with and hostility towards Pullman and its social regulations. The denunciations were general rather than specific, and the tone was rather one of envy more than anything else. The fairly large number of workmen I met gave me the impression that on the whole it was for a man's advantage to live in one of Pullman's houses. It was not necessary, but good policy, to rent from Pullman, and on the whole they failed to appreciate his benevolence in furnishing them a good, clean brick house with unlimited pure water, gas, and sewerage. The general complaint seemed to be that they were too much under Mr. Pullman's thumb; there was no room for individuality or independence. There was a gentle but never ceasing Pullman pressure about them. The workman owned nothing except the clothes on his back and the furniture in his rented house. The house, the land, the grassplot in front of each house, the stores, the school, the church, the very streets were Pullman's. As nearly as I could make out, the cause of discontent was lack of individual freedom, and opportunity to acquire something one's own. The very commendable desire of nearly all skilled workmen to have and control a bit of land and some sort of a habitation thereon for one's very own—a castle of rest, where he is supreme boss in his own household—this was impossible under the conditions of life in Pullman's model town.

Coupled with the fact of the suppression of the individuality of the workman, or rather lack of opportunity to get on like his brother workmen in other places not "model," was a feeling of perhaps awe and envy in the average workman's mind at the stupendous and seemingly unlimited resources of the Pullman Company, or, as they thought, Mr. Pullman himself. The contemplation of the immense Pullman building on Michigan Avenue, and Mr. Pullman's magnificent private residence, together with the fact that a few years ago he

was merely a plain, humble workman like themselves—a carpenter and house-mover—these impressions, constantly reinforced by the sight of the sumptuously furnished Pullman cars they manufactured for him, showed a plane of living far beyond any possibility of their attaining. Trivial as it may seem, the fact that their master bore a European title helped widen the gulf between employer and employee. The promptness with which the whole town, previously Republican, voted the Democratic ticket when Mr. Pullman expressed a desire that they should vote the Republican ticket, was no surprise to observers who knew the employees personally.

Had these same men been engaged in manufacturing pig-iron, for instance, instead of an article which constantly reminded them of a higher and to them impossible condition of life; had they been living in a frame dwelling of their own in a back street, on a lot 25 feet by 100, paying their own taxes for water, sidewalks, and pavement, instead of living perforce in a rented building in a community where they had nothing to do with the local government, I doubt very much if the meddlesome Debs could have made them under such conditions his unfortunate dupes.

After years of intimate association with the American workingman, I am convinced that one of the strongest sentiments in his breast is the love of home. When, at the close of a day's toil, he can put on his coat and hat, leave the shop behind him, go home, "wash up," and eat supper, smoke his pipe and read the paper or watch the children play, or play with them while his wife is "doing up the dishes"; when he feels he owns everything about him in fee simple, that he is the boss and master in his own house—that man is happy. When his wife in the back kitchen hums "Home, Sweet Home," it is full of kindly meaning to him. Mr. Pullman in his scheme for a model community for American workmen overlooked this peculiar American characteristic. Hence, in my humble opinion, these tears. E. L. C. Morse.

Ithaca, N. Y., July 23, 1894.

## LABOR ANARCHISTS OF THE LAST CENTURY.

To the Editor of The Nation:

Sir: It may be of interest to see that the methods of strikers have not changed in a hundred years. In a letter to John Ross, under date London, May 14, 1768, Franklin says:

"Even this capital, the residence of the King, is now a daily scene of lawless riot and confusion. Mobs patrolling the streets at noonday, some knocking all down that will not roar for Wilkes and liberty, courts of justice afraid to give judgment against him; coalheavers and porters pulling down the houses of coal-merchants that refuse to give them more wages; sawyers destroying sawmills; sailors unrigging all the outward-bound ships, and suffering none to sail till merchants agree to raise their pay; watermen destroying private boats and threatening bridges; soldiers firing among the mobs and killing men, women, and children, which seems only to have produced a universal sullenness, that looks like a great black cloud coming on, ready to burst in a general tempest."

And to Joseph Galloway, under the same date:

"While I am writing, a great mob of coal porters fills the street, carrying a wretch of their business upon poles, to be ducked and otherwise punished at their pleasure for working at the old wages. All respect to law and government seems to be lost among the common people, who are, moreover, continually inflamed by seditious scribblers, to trample on authority and everything that used to keep them in order."

Further on in the same letter:

"Several of the soldiers are imprisoned. If they are not hanged, it is feared there will be more and greater mobs; and, if they are, that no soldier will assist in suppressing any mob hereafter. The prospect either way is gloomy. It is said the English soldiers cannot be confided in to act against these mobs, being suspected as rather inclined to favor and join them." A. B.

July 15, 1894.

## A CORRECTION.

To the Editor of The Nation:

Sir: Your article on "Gov. Altgeld and the President," in the *Nation* of July 12, speaks of the authority under which the President acted in sending federal troops into Illinois, as derived from sections 5298 and 5299 of the Revised Statutes, and assigns dates to the sections. Section 5299 was enacted April 20, 1871, as you state; but section 5298 was enacted July 29, 1861, not 1891. The mistake is the more confusing as Gov. Altgeld, in his first communication to the President, refers to the "federal statute" under which the President was acting as "in reality a war measure," which, in a sense, section 5298 undoubtedly is.

This in the interest of accuracy, not of Altgeldism.—Truly yours,

Russell Whitman.

Chicago, July 16, 1894.

## THE PUBLIC LIBRARY IN NEW HAMPSHIRE.

To the Editor of The Nation:

Sir: Will you permit me to call attention to an error in your notice (July 12, p. 28) of my 'Public Libraries in America'? You make it appear that I state that New Hampshire has passed a law requiring towns to establish and maintain public libraries. I only said that such a law had been presented to the Legislature of the State and ably advocated by its author, a member of the State Library Commission. That such a law can actually be passed in any State for some years to come is very doubtful. W. I. Fletcher.

Amherst, Mass., July 19, 1894.

## HAWAIIAN SALARIES.

To the Editor of The Nation:

Sir: Your editorial in the *Nation* of May 24, entitled "Playing the Missionary for All He is Worth," is full of remarkable mistakes. A prominent one is in your comments upon your statement that the Government has voted its members increased salaries. The appropriation bill for "salaries and pay-rolls," you say, "was made valid for *two* years so as to guard against unpleasant contingencies." This ought to have indicated to you that the pay provided for was to cover the whole period of two years. You suppose the salary voted was for one year, and with this fundamental error on your mind you are led to make false and unjust criticisms. You say the "Hawaiian chief justice receives $1,500 a year more than Chief Justice Fuller." The truth is that the statute fixed my salary at $6,000 a year, and the Legislature, having only biennial sessions, voted me $12,000 salary for the two years. Chief Justice Fuller's annual salary is $10,500, and he thus receives just $4,500 more a year than I do.

You also say: "Each of the cabinet draws $1,000 a year more than the members of our cabinet." The fact is that the salary of a cabinet minister here is $9,000 for two years. Dividing this by two, the annual salary is $4,500, which you are pleased to say is $1,000 more than that of a secretary of a department of the United States Government! The former salary of a minister here was $9,600 for two years, or $4,800 per annum. The present ministry thus voted themselves a reduction of $300 a year.

Will you please make these corrections and oblige your subscriber, A. F. Judd,
Chief Justice Supreme Court of the Hawaiian Islands.

Honolulu, June 15, 1894.

[We must, of course, accept the Hawaiian Chief Justice's interpretation of an appropriation act which, on its face, naturally bore the meaning we gave it. In asserting that the present ministry voted themselves a reduction of $300 a year, however, Chief Justice Judd is scarcely ingenuous. Whatever the salaries may have been at some indefinite period, the record of the proceedings of the councils shows that increased salaries were voted the ministers by the ministers, and that despite a rule cited against their right to do it. We should have been glad if the Chief Justice had specified any other of the "remarkable mistakes" of which the offending article was "full."—Ed. Nation.]

## POPULAR ELECTION OF SENATORS.

To the Editor of The Nation:

Sir: The proposition to give directly to the people the election of United States Senators, which has been embodied in Senate and House bills for amending the Constitution, and has been discussed in the pages of the *Nation*, suggests the idea of giving to each State three Senators instead of two, with the provision that in each State one Senator should be chosen by popular vote every two years at the same election at which Representatives in Congress are chosen. This plan would preserve the equality of the States required by our federal system, and, the term of a Senator remaining six years, would improve upon the present division of the Senate into thirds, in that each class or third would contain a member from every State in the Union, and the biennial renewal would bring a third of the entire membership fresh from the people of all the States. An enlarged membership of the Senate will be recognized as an advantage, in view of the immense volume of business pressing upon its committees. J. W. H.

Washington, July 20, 1894.

## THE PARTHENON FRIEZE.

To the Editor of The Nation:

Sir: I have just rediscovered among my files of journals the letter of Dr. Waldstein on the above subject, and beg to be allowed to say a word on it. As long ago as my first residence in Athens, twenty-five years ago, I was victimized by one of the so-called antique terracottas, admirably made and ingeniously broken to prove its genuineness better. I then discovered that the manufacture of these "plaques" was a business at Athens, and that any desired number of them could be got by

exercising a little caution. I am not surprised that Dr. Furtwaengler should have been deceived, for his work on the 'Master-Works of Greek Sculpture' shows that, however much he may know of archæology, he knows very little indeed of art; but I am surprised that Dr. Waldstein should persist in maintaining the possible originality of these terracottas, for the genuineness of which there is not the least evidence. The very variations which he takes for evidence of it is proof only of the cleverness of the Athenian counterfeiters, who are extremely able sculptors, in some cases at least, and quite capable, once the manner is furnished, of giving you excellent imitations of any epoch. The simple fact that, in the official excavations of the débris of the Acropolis, no fragment of these hypothetical sketches of the Parthenaic artists was found, ought to satisfy one that their existence was a myth. If they were the originals, where would one expect to find remains of them if not on the spot where the originals were used for the reproduction in marble? And where were they found? No one can tell us—in excavations here and there, where they could not have had any relation to the Parthenon.

Dr. Waldstein's appeal to the authority of the late Alessandro Castellani is unfortunate, as that fortunate dealer himself admitted to me that he knew very little about archæology, and did not pretend to judge of the genuineness of an antique (?), but limited himself to the quality of the art. The extraordinary counterfeit of a Roman horn which he sold to the Emperor Napoleon III., and which was given to the museum at S. Germain, showed that his expertise could be supported only at the expense of his honesty, which is, I am sorry to say, the case with a good many dealers in antiquities. At all events, his testimony in favor of the "plaques" is worth nothing, for he could not even tell a false from a genuine "figurine," and did not pretend that he could.

The counterfeiting of all classes of antique objects is now carried to such perfection that we can in most cases be certain of the genuineness of one only by knowing where and by whom it was dug up; but for the Parthenon plaques there never was a reason, except utter inexperience in such articles, for accepting them as antique. M. Reinach's judgment in these matters is one in ten thousand; and if there were a judgment more trustworthy than his, I should say it could only be that of the maker of the counterfeits himself.

Yours truly, W. J. Stillman.

Rome, July 7, 1894.

## "BACK AND FORTH."

To the Editor of The Nation:

Sir: For the last ten years I have been in constant association with Cornish miners located on Lake Superior. The expression "foorth and back" is a common one as used by these men, and, as far as I remember, conveys the idea of "wrong end to" or "hindside forth." I have heard a woman say, referring to her husband's head-gear, "'Ee 'ave 'is 'at on foorth and back." I recall a Cornish pitman discussing the failure of a duplex steam-pump to run, saying, "I gnawed they pump wudna run, fur 'ee 'ad they rockers in foorth and back."—Yours truly,

J. Parke Channing.

Narragansett Pier, R.I., July 19, 1894.

# Notes.

John Wiley & Sons announce 'The Memphis Bridge,' by George S. Morison; 'A Text-Book on Roads and Pavements,' by Fred P. Spalding of Cornell University; 'Sewage Disposal,' by Wynkoop Kiersted; 'The Principles of Modern Dairy Practice,' from a bacteriological point of view, by Gösta Grotenfelt; and 'A Record of the Transportation Exhibits Building of the World's Columbian Exposition of 1893,' by James Dredge.

Ginn & Co. have nearly ready 'Mediæval Europe 800 to 1300 A. D.,' by Prof. Ephraim Emerton of Harvard, in continuation of his 'Introduction to the Study of the Middle Ages.'

J. Selwin Tait & Sons will shortly publish 'Before the Gringo Came,' stories of early California days by Gertrude Atherton; 'A Seventh Child,' by John Strange Winter; and 'The Untempered Wind,' by Miss Joanna N. Wood, a Canadian writer.

Prof. A. C. Fraser's two-volume edition of 'An Essay concerning Human Understanding,' from the Clarendon Press (Macmillan), contains not only Locke's great Essay, but a very valuable introduction of 134 pages of biographical and critical matter, embodying, perhaps, the best thoughts of Prof. Fraser himself, who has also added copious foot-notes, to the extent, as we estimate, of a third of the two volumes. The best of all the new matter is, we incline to think, the account of the various interpretations which have been given, not only of the Essay itself, but of its different topics, books, and chapters. The critical sections bring out with great clearness over against Locke the views of real existences—self, God, and outward things—which characterize Prof. Fraser's school. It need hardly be said that this edition constitutes henceforth an indispensable instrument for every teacher of Locke, and might be used along with Fowler's little digest, reviewed in these columns in 1880.

The Rede lecture delivered at Cambridge, England, on June 13, by J. W. Clark, Registrar of the University, has been printed in a thin volume ('Libraries in the Medieval and Renaissance Periods'; New York: Macmillan). The subject naturally lent itself to illustration, and the lecture was in fact delivered with the aid of lantern slides, drawn from books, manuscripts, and photographs of libraries still in existence. Only seven of these are reproduced in the printed volume, whose value would have been greatly enhanced if the remainder had likewise been admitted. Still, the principal types of lecterns and shelving, and the disposition of chained books either on their sides or on end with their fore edges showing, are well depicted. Mr. Clark proves that the fittings of collegiate libraries were imitated from the monastic, and in general makes evident the closeness of tradition in these matters from classic times, with such changes as the invention of printing necessitated.

The number of plans in 'Academy Architecture,' the annual review for 1894 (New York: Scribners), is relatively small, as usual, but the elevations and interior views possess quite the average interest. They are drawn in the main from the exhibitions of the Royal Academy, London, the Royal Scottish Academy, Edinburgh, and the Glasgow Institute of the Fine Arts, and are supplemented by some foreign examples, in which the United States is represented. Drawings and photographs from the finished building or monument or detail are mingled. Curious is the design for a new cemetery at Chiavari, Italy. There are several views of the interior of the Court Museum at Vienna, and some queer Russian structures, including an iron memorial church. The editor himself supplies a view of his fine girls' school-building at Zurich.

Prof. Dr. J. Scheiner's 'Die Spectralanalyse der Gestirne,' brought out in the original German edition four years ago, has been translated, revised, and enlarged, with the coöperation of the author, by Prof. Edwin B. Frost of Dartmouth College. Ginn & Co. have just published this excellent treatise on astronomical spectroscopy in appropriate and available form for the purposes of both teacher and investigator.

The seventh volume of the 'Journal des Goncourt' comes from the press of Charpentier. It covers the years 1885-'88, and, aside from the querulous and fretful complaints of M. Edmond de Goncourt, treats chiefly of Daudet's ill health and his need of chloral. There are passages about other authors, here and there, and numerous references to Porel, who managed the Odéon and brought out "Henriette Maréchal" and "Germinie Lacerteux"; an ill-tempered attack on Sarcey, which, appearing after the lapse of years, does no credit to the author; and two sneers at the late President Carnot, one on the occasion of his election to the Presidency, and the other, at the very end of the book, on account of the interdiction of "Germinie." Yet the book, though largely frivolous and thin in matter, is interesting, for it exhibits plainly the temperament of the writer, and gives incidentally a clear insight into some of the causes of the particular kind of decadent and noxious literature which has afflicted France of late and still afflicts it, though signs of healthy reaction are fortunately not wanting.

In M. Gaston Deschamps's 'La Vie et les Livres' (Paris: Colin & Cie.) such signs are strong and encouraging. After the pages of Goncourt, the pages of Deschamps are invigorating. There is a clean feeling about them which is not their least valuable feature. M. Deschamps is the literary critic of the *Temps*, and he has a very captivating style, as all readers of the articles "La Vie littéraire" know. His idea of criticism is to think of the reader as well as the writer, to examine and set forth, as plainly as possible, the causes at work in the world which have brought forth the particular book he is to review—in short, "to combine the observation of events with the analysis of the work," and to make the history of books contribute to the knowledge of contemporary society. The application of his ideas is a series of charming articles, in most of which not a single book or writer, but a group of writers and books, is discussed intelligently, wittily, but not superficially, and with much catholicity of feeling. Particularly interesting are "La Conversion de M. Paul Bourget," "Sur la mort de Guy de Maupassant," "Littérature et politique," and "Officiers et soldats."

Gustave Merlet's 'Études littéraires sur les classiques français' has long been known to and appreciated by students of French literature. A new edition, by M. Eugène Lintilhac, has been published by Hachette. The text has been recast, Merlet's notes in successive editions being incorporated into it, and all necessary corrections and additions made which the progress of literary criticism called for. Besides smaller additions of his own, M. Lintilhac has contributed studies on Villehardouin, Frois-

sart, Commynes, the letter-writers of the seventeenth and eighteenth centuries; Voltaire, critic, philosopher, and polygraph; and Buffon. An excellent table of works of reference greatly enhances the usefulness of the two volumes.

M. Maurice Albert's latest book is on 'Les Médecins grecs à Rome' (Paris: Hachette). In it he shows how the Greek physicians fairly took and kept possession of Rome. The book is entertaining even to laymen, who will learn something more of Archagathus, Asclepiades, and Galen than their mere names, and at the same time something about Roman life.

We have before us the first number of the *New Science Review*, a quarterly "miscellany of modern thought and discovery," published in Philadelphia, and addressing itself to the public at large (Transatlantic Publishing Co.). The articles are decidedly short for a quarterly, and the longest are not the best, *teste* Mrs. Bloomfield Moore on the propeller of Keely's air-ship ("A Newton of the Mind"!), and Julian Hawthorne on "Scientific Creation," *alias* Keely and his motor. Mr. M. D. Conway writes about "Thomas Paine and the Republic of the World." There are also articles on the ice age, on the problem of the pole, on diamonds and gold; and Prof. Angelo Heilprin edits a department of "Current Scientific Discussion."

The *Architectural Review*, Boston, begins its third volume under its present title with the May number. It has an established repute among professional journals of its class, and has doubtless not reached the end of its development. In the number just named Mr. Thomas A. Fox continues his interesting notes of a tour in Greece, with a chapter on Argolis, accompanied by charming views of temple, tombs, gateway, and landscape at Argos, Nemea, Mykenæ, Tiryns, and Nauplia. Especially to be remarked are the Treasury of Atreus, the Lion Gate, the Gallery at Tiryns, the platform of the Heræon at Argos, the head of Hera, and the Plain of Argos from Mykenæ.

Baron E. von Toll gives an interesting account of his adventurous journey last year across northern Siberia, in *Petermann's Mitteilungen* for June. His principal object was to examine the remains of a mammoth recently discovered, and to make astronomical observations, for which purpose he was accompanied by a Russian naval lieutenant. When the place where the mammoth had been found was reached, the snow was too deep to permit of a thorough search, and accordingly, with four men and three dog-sledges, they crossed the ice—a two-days' journey—to the New Siberian Islands. On the southernmost they made a cache of provisions, and a second in lat. 75° 37', for Dr. Nansen in case he should be obliged to abandon the *Fram* and retreat to Siberia. The spring opened nearly three weeks earlier on the islands than in 1886, when the Baron had previously visited them—a fact which he interprets favorably to Dr. Nansen's plans. At that time the first bird was seen on May 28; but, in 1893, gulls appeared on May 10, and on the next day geese, and, *from the north*, ducks. A little later the robber-gulls came, and fed upon the lemming, who were migrating in great numbers. "These sole winter inhabitants of the islands were exchanging their quarters; some were going from the mainland to the islands, others were leaving the islands for the mainland." The return journey was very difficult, on account of the melting snow and ice, but was accomplished safely, and the coast was reached May 27. After an ineffectual search for a perfect specimen of a mammoth—only a skull from which the tusks were gone, some bones and hide, being found—the explorers crossed the tundras by a mostly hitherto untravelled route, partly on reindeer and partly in sledges, to the settlements on the Yenisei.

An interesting account of the great Siberian Railway, by our consul-general at St. Petersburg, Mr. J. M. Crawford, is published in Consular Reports for July. Since May 12, 1891, when the Tzesarevitch laid the first stone in Vladivostok on the Pacific, preliminary surveys have been made over the entire route, and the work of construction is now going on in three of the seven sections into which the whole line is divided. Trains are running for 160 miles eastward from the western terminus, Tcheliabinsk, and from the Pacific terminus westward 120 miles. There appear to be no serious engineering difficulties—only one tunnel, less than two miles long, is mentioned—while the highest point reached, at the divide between the Arctic and Pacific Oceans, is only 3,665 feet above the sea-level. The total length of the road will be 7,115 miles, and the estimated cost is about $175,000,000. In addition to this sum, $7,000,000 have been appropriated for certain auxiliary measures in connection with the railway, as the construction of a branch to the Ural mines, improving the Siberian rivers, and developing steam navigation on them and in the Kara Sea, assisting colonization, encouraging iron works, and equipping geological expeditions, especially for studying the Amur region, etc. A map and a longitudinal profile of the road-belt accompany the report.

The hopes that the recent trade convention between China as the suzerain power in Tibet and the Indian Government would soon lead to free intercourse between the two countries have been rudely disappointed. Two English missionaries who recently crossed the Indo-Tibetan frontier in violation of the conditions of the convention were arrested by the Tibetans, and would have been murdered but for the intervention of the Chinese guard, who conveyed them back to India. The result has been that all the advantages expected to be gained from the treaty are endangered. Trading has apparently almost ceased, and the Tibetans are reported to be building a wall along the frontier, where the missionaries crossed, to prevent any further intrusions. This would seem to disprove the assertion of some travellers—notably of Miss A. R. Taylor, to whose adventurous journey in this country we have called attention—that the Tibetans are anxious to break down the barriers between their country and India, but have been prevented hitherto by the Chinese in the interests of their trade monopoly. These sturdy mountaineers, however, apparently fear that, with the coming of the Europeans, their independence will be lost. So strong a feeling has been aroused by this incident that the Lieutenant-Governor of Bengal has been compelled to recommend to the Chinese Government to stop a missionary party about to enter Tibet from China. Naturally this has excited much bitterness against the Government, but the responsible organs of British opinion in India realize that "even missionaries cannot be permitted to extend their excellent work at the sacrifice of the British character for international good faith."

The Bulletin of the American Geographical Society for June 30 makes a timely appearance with reference to the distracted condition of Nicaragua. Mr. Courtenay de Kalb contributes a not inconsiderable Bibliography of the Mosquito Coast, filling upwards of six pages. By far the larger number of titles have been verified by Mr. De Kalb by personal examination of the works which bear them, and he had the advantage of having visited the Coast and studied the political conditions of that anomalous little territory.

—The sixteenth annual session of the Association Littéraire et Artistique Internationale will be held at Antwerp, August 18 to 25. It will be the third reunion in Belgium, a previous meeting having been held in Antwerp in 1885, and one in Brussels in 1884. It is not to be expected that this year's conference will be as epoch-making in the history of literary-property protection as was the noteworthy Brussels copyright congress of 1858, but the subjects for consideration are sufficiently important and varied. The programme is a long one, and, what with the interruptions caused by social attentions, and the special temptation to irregularity of attendance incident to the presence in Antwerp of the International Exposition, it is doubtful if the whole of it can be discussed. A number of topics are carried over from last year, such as publication contracts; property in titles, portraits, photographs, and translations; the question of registration and deposit of copies, and, in connection with this last, the interesting project of the establishment at Berne of a universal bureau for the recording of copyrights. New subjects for discussion are collaboration, arbitration in literary-property disputes; property in personal names; property-rights in stereotype plates; the rights of authors in relation to gratuitous representations, and some clauses of the International-Copyright Treaty. Reports are also expected on the status of copyright in North and South America, Great Britain, Denmark, Norway, Austria, and Russia. The project of holding next year's session in the United States having fallen through, efforts are being made to secure the naming of some German city for that honor.

—One of the most serious results of the increasing army expenditures in Prussia has been the curtailment of the public-school fund. Prussia, proud as she is of her school system, has always been rather indifferent to the lot of the schoolmaster. The school census of 1891 showed that the teachers in the elementary schools were not only sadly underpaid, but greatly overworked. There was then an actual deficiency of 12,652 teachers—that is to say, in 25,304 classes the teachers had to do double work, and many of these classes numbered 120 to 150 children each. Since then matters have not improved, and the Minister of Public Instruction not long ago declared before the Diet that the country was threatened with "a collapse of its public-school system." The causes, according to a well-informed writer in the Berlin *Gegenwart*, himself a "Schulmann," are to be found not only in lack of funds, due to the demands of militarism, but also in the influence of the church and the aristocracy over the public schools. In spite of the law of 1872, according to which the supervision of schools rests entirely with the State, the country-school inspectors are almost everywhere clergymen. The entire pedagogical outfit of these inspectors is in the majority of cases acquired in a six weeks' course at the seminary. The district inspectors (*Kreisschul-Inspectoren*) are likewise generally theologians. The teacher, dependent on the good will of his clerical superior, often performs menial services. Only since last February have the country teachers been released by ministerial ordinance from the performance of such duties

as the sweeping of church floors, the tolling of bells, the lighting of fires, etc. The influence wielded by the landed proprietors, who have still so largely the right to appoint teachers within their domains, reduces the appointees to a condition not far removed from vassalage. In 1891, 12,160 teachers' positions were within the gift of the nobility; Count von Donnersmarck appointing 129, Prince Pless 123, the Duke of Ratibor 87, and the Duke of Ujest 65. Efforts to improve the pecuniary status of the teachers sometimes meet with an almost brutal rebuff. Thus, a Pommeranian commission, discussing the subject during the ministry of Von Zedlitz, declared that a salary of 600 marks ($150) was more than sufficient for teachers in that province, and that, indeed, it ought not to be more than 586 marks. A grave aspect of the situation is the impossibility of endowing properly the higher technical and industrial schools (*Fortbildungs-Schulen*). They are likewise hampered by lack of funds, and do not compare in efficiency with the schools for workingmen (*Arbeiter-Bildungsschulen*), which have been established under socialist auspices. There was a certain justice in the remark of Herr Liebknecht last January, that, "whatever knowledge of politics and economics our laborers have acquired, they owe to the Social Democrats."

—Among the members of the Board of Visitors to the Royal Observatory at Greenwich the present year are Lord Kelvin, President of the Royal Society; Lord Rayleigh, the Earl of Rosse, Profs. Sir George Stokes and Sir Robert Ball, Dr. William Huggins, Prof. Darwin of Cambridge, and Capt. Wharton, Hydrographer of the Navy. The annual visitation took place June 2, and the Astronomer Royal, Mr. Christie, reported upon the conditions and workings of this immense establishment in the fullest detail. Owing in large measure to the fine weather prevailing through a great part of the year, the fundamental instruments secured an exceptionally bountiful harvest of observations, and these are kept well advanced towards the final publication—vastly better, in fact, than at other observatories under Government auspices. Satisfactory progress is reported upon the new universal transit circle, or altazimuth, constructing by Messrs. Troughton and Simms. Sir Henry Thompson has generously offered the sum of $25,000 to provide a large photographic telescope and the necessary subsidiary accessories, and this valuable gift will serve as an important complement to the 28-inch visual telescope just completed. No delay in the permanent installation of this fine instrument seems likely; the Admiralty promptly accepted the offer, the aperture of the photographic lenses was fixed at twenty-six inches, and the order was given to Sir Howard Grubb, the eminent Dublin optician, who has contracted to complete it before the end of 1895. The astrographic survey is progressing fairly, nearly a thousand plates having been made during the year. Also the moon and several double stars and planets have been photographically recorded. The sun's activity in spottedness has been fully maintained throughout 1893, and the Greenwich photographs, when supplemented by those from India and Mauritius, afford a permanent record of the solar surface on 359 days of the year, whose characteristic has been rather the great number of groups visible at the same time than the extent of any one of them. Here also the forward state of the computations precedent to the permanent availability of this important work is worthy of note. For the summary of meteorological details, the Astronomer Royal's report must be referred to, but it is interesting to observe that the number of hours of bright sunshine recorded automatically during 1893 was 1,454, the greatest since the commencement of the registration in 1877, and 171 above the average of the preceding sixteen years. Occasional longitude campaigns are undertaken; Montreal, Paris, and Liverpool having been determined from Greenwich.

—It is evident from the report of the Missionary Conference, recently held in London, that the scientific stage in the history of missions has been reached. The papers read and the discussions upon them all emphasized the truth that, for the successful propagation of Christianity in heathen lands, its doctrines and precepts must be presented and enforced with careful relation to the habits, laws, and religious beliefs of the people. This important principle was very clearly shown in the interesting discussion on polygamy. The majority of the early missionaries (not all of them) inexorably required that a man on accepting Christianity should put away all but one of his wives, and in making this demand they were upheld by the general approval of the Christian world. But it was shown, and by none more forcibly than by Mr. R. N. Cust, the well-known Indian official and writer, that to do this was to inflict a grievous and iniquitous wrong upon innocent women lawfully married to their husbands. A religion making such a demand upon its converts could expect but little success among the Hindus at least, with whom the marriage tie is indissoluble. Mr. Cust's conclusion (and that, apparently, of all who took part in the discussion) was that "a man cannot be permitted" to become a member of a Christian church "at the expense of his innocent wives." While there was little or no diversity of opinion as to the propriety of baptizing a woman although she was one of several wives, only two or three laymen advocated the baptizing of men who are polygamists. But in India, according to the last census, this is a case which would but rarely occur, the vast majority of both Hindus and Mohammedans being monogamists.

—In this same conference the Rev. Horace Waller brought a heavy indictment against the English Government in respect to slavery in the island of Pemba, in the protectorate of Zanzibar. According to the report, in 1888, of a naval officer on one of the cruisers on the east coast of Africa, 5,000 slaves a year were at that time smuggled into the island to work upon the Arab spice plantations. This is an enormous waste of life, considering its size (372 square miles) and its estimated population (from 10,000 to 50,000), and makes probable the report that "the longest-lived of the slaves succumb in eleven years, and that on the average they die in about seven." These facts would seem to demand some action on the part of the Government, at least to protect the slaves. But, according to Mr. Waller, "no mine in Siberia filled with criminals transported for life is more safely sealed up against prying investigation than Pemba. There is neither consul, vice-consul, nor missionary there. Those who inquire cannot find in Blue-books nor in any public office that a consul ever lived a month on the island or made a report upon the number (even approximately) of the plantations or the slaves upon them."

—The question of the revival of the Olympic games has lately been considered and discussed by the International Athletic Congress, which has just closed its session at Paris. A committee was appointed, under the presidency of Mr. Bikélas, who, on June 19, read a long memoir from the Panhellenic Society of Athens concerning the rules and conditions under which the ancient games were celebrated, and those under which it would be fitting that the revived Olympics should take place. After hearing this, the committee voted unanimously for the reëstablishment of the games. Free discussion then followed, and it was agreed that the new Olympics shall be celebrated every four years; that the first contests shall take place in the year 1896 in some capital city to be determined upon hereafter; and that the second shall be in Paris during the Exposition of A. D. 1900. It is expected that none but amateur athletes will take part in the games, with the single exception of the fencing-matches. It was precisely this thorny question of amateurism and professionalism, over which floods of ink have been shed, which was likely to give the commission most trouble. The problem existed of old time, but modern civilization has greatly complicated it. There will be much curiosity to see what definition of "professional" and "amateur" the commission will set forth. It seems to be starting out in a wise and sensible way. It has already decided that betting is a disqualification, and that contestants are to have no share of any gate-money. The list of the games includes gymnastics, shooting, athletic sports and games, rowing, yachting, swimming, bicycling, and fencing.

—If the death of the Countess Agénor de Gasparin had happened twenty years ago, it would perhaps have seemed a greater and more immediate loss to literature than it does now. Since the death of her husband in 1871 she has been living for the most part in retirement, and if she had not quite given over writing, her later books have been much less in view. Besides, many of the causes which in their dark hour the Gasparins nobly advocated have gained the day; others are no longer of pressing interest. But Sainte-Beuve thought a study of Mme. de Gasparin a work not unworthy of his time and pains, and even now one may properly stop to note the close of a literary life that has been more than half a century long. Valérie Boissier was born in Geneva in 1813, the sister of the well-known Swiss botanist. She began her literary work by writing some stories of no great value under a pseudonym. It was travel that wakened her powers, and her 'Voyage d'une ignorante dans le midi de la France et en Italie,' which appeared in 1835, showed unmistakable qualities. In 1837 she married Count Agénor de Gasparin and removed to Paris, where her husband sat in the Chamber of Deputies from 1842 to 1848. Here her 'Mariage au point de vue chrétien' appeared in 1842. It received a gold medal from the Academy, and its success gave her an assured position as a writer. Then followed the long series of volumes of travel, of religion, of politics and sociology, and of romantic fiction which have made her a name. There is no need to recount their titles: some are already forgotten, some, perhaps, will live through this generation at least. The 'Horizons Prochains,' the 'Tristesses Humaines,' and the 'Horizons Célestes' have some pages of a real eloquence in them, and breathe a spirit of sympathy and tender pity which is most delicate and persuasive. Sainte-Beuve was able to say much more of her than this. He found in her work "une

vigueur incomparable," a style "viril et emporté," a talent full of "sève et la vitalité"—qualities which are less obvious to us to-day. Mme. de Gasparin died at a country-house near Geneva on the 18th of June.

## MARCELLA, AND OTHER NOVELS.

*Marcella.* By Mrs. Humphry Ward. Macmillan & Co.

*A Bundle of Life.* By John Oliver Hobbes. J. Selwin Tait & Sons.

*The Rich Miss Riddell.* By Dorothea Gerard. D. Appleton & Co.

*His Vanished Star.* By Charles Egbert Craddock. Houghton, Mifflin & Co.

*The Raiders.* By S. R. Crockett. Macmillan & Co.

*Cheap Jack Zita.* By S. Baring-Gould. J. Selwin Tait & Co.

*Claudia Hyde.* By Francis Courtenay Baylor. Houghton, Mifflin & Co.

*Life's Little Ironies.* By Thomas Hardy. Harper & Brothers.

*The King of Schnorrers.* By I. Zangwill. Macmillan & Co.

*The Flower of Forgiveness.* By Mrs. Steel. Macmillan & Co.

*A Protégé of Jack Hamlin's.* By Bret Harte. Houghton, Mifflin & Co.

*In Exile, and Other Stories.* By Mary Hallock Foote. Houghton, Mifflin & Co.

*Salem Kittredge, and Other Stories.* By Bliss Perry. Charles Scribner's Sons.

THE idea of human equality that animated the terrific drama played by the world in the declining years of the eighteenth century, inspires in its dying successor a drama of equal pretension to the earth for its stage and the nations thereof for actors. That furious, historical passion which imperilled the existence of nations and changed their destinies, was naturally productive of a noble literature. In our own actual drama the force of that desperation which must move on to overwhelming tragedy is not yet felt, and in the literature to which it has given an impulse, the strain that will not die is not yet heard. It would seem that the idea has lost some of its intellectual and spiritual splendor, and that its most urgent appeal leaves the imagination cold, thus assuring us of a catastrophe far short of universal smash, and also depriving us of any certainty of assisting at the blossoming of a new group of immortals. A cry for equality of dinners, rest, and play has not enough soul or sonority for an epic, or enough yearning pathos for imperishable lyrics. It quite lacks the imperative note that deluges spheres in blood. But by volume and persistence and the occasional spur of a bomb it can command earnest and agitated attention, and can supply the realistic novelist with facts whereon to build a fictitious case which may be exciting, widely significant, and entirely consistent with a conscientious abhorrence of romanticism.

Already the fictitious cases are as the stars in heaven for number, and also for degree of luminosity. Among the hosts of little twinklers an occasional steady light shines out, but Mrs. Ward's 'Marcella' is the only approach to a first magnitude. This was of course expected as soon as it was rumored that Mrs. Ward had tackled the social question. It is curious to note the eagerness with which a novel by Mrs. Ward has come to be expected, especially when it is perfectly known that she will speak to the thoughts of men, never to their senses or caprices. People believe that she will, in some impressive way, formulate ideas which to-day interest the multitude and which yesterday were the exclusive property of the philosopher, the poet, or other rare freak of nature held in suspicion of lunacy by the vulgar. Her third novel is a flattering tribute to the justice of such expectation and the wisdom of this popular belief.

Everybody is now familiar with the plot, the fictitious element of 'Marcella,' and there is superfluity in saying more than that it is cleverly fashioned for illustration of the idea, and well sustained. The points less frequently noticed are the comprehensive treatment of the idea and the justice of perception of the value of our modern, actual drama. Almost every conceivable "view" has a representative well fitted by nature and circumstance for his rôle, and the whole case rests at fizzle, compromise; foreshadowing infinite talk, adjustment, and readjustment, some violence, but no world-desolating tragedy. We do not mean to imply that the characters are merely well-considered, galvanized "views." Their enthusiasm for absolute or approximate equality of material good impels them to experimental action, in the course of which one gets a notion of their individuality separated from a temporarily absorbing cause. With the exception of the scholarly and instructive Hallin, each makes an impression of completeness; and in his case the failure appears to be in the author's inadequate grasp of the intellectual height where she wished to place him. Marcella, the personage of the novel, is very thoroughly grasped and very vividly set forth. In her impetuous career she falls foul of most of the thrilling situations which our drama can provide, the occasional accidental tragedy, and the enduring ugliness of poverty with its attendant evils. The end of Marcella, so far as Mrs. Ward takes her, is carefully prepared from the beginning—too carefully to stimulate a very great liking or any sort of confidence. Her vanity, self-complacence, and love of power are even more obvious than her intelligence, her hatred of injustice, and her compassion for physical suffering. When she abandons her admirable lover because he will not yield about the petition for reprieve of the condemned poacher, considerable resentment for the personal snub is mixed with her turbulent sympathy and acute impersonal distress. When she carries coals for sick Jewesses and rushes into tenement-house frays, her spirit of adventure is having its fling, but it is not possible to feel that her vocation is for self-abnegation in obscure slums—that she is going to stick. On the other hand, her return to love and luxury does not argue shallowness or insincerity, but is a very natural reaction for a damsel so eager for experience and so ardent in the business of living. The humor of her reasoned descent from tragedy to commonplace is patent and delightful to a cynic, but Marcella didn't see it—Marcellas never do. Mrs. Ward's obliviousness to humor gives the last touch of excellence to the drawing of such a character, yet is a fatal obstacle to greatness as a delineator of life. In the whole book there is not the ghost of a smile—a grave fault, but one that would be much more oppressive if it could as justly be found with our actual drama as with its counterfeit presentment.

This deficiency in the sense for comedy, the sense that relieves the tension of well-ordered life and makes existence lovely even for conscious sinners, is not the defect of the author of a little book entitled 'A Bundle of Life.' Indeed, the lady who assumes the name John Oliver Hobbes has so many of the qualities that Mrs. Ward lacks, and so few that she possesses, that one wishes the two could be made one, and all doubts about the coming of the great novelist set at rest. Mrs. Ward gives us people largely fashioned by the spirit of the time and, in turn, fashioning it—people whose thoughts have been widened and passions modified by the process of the suns; Mrs. Craigie gives us the primitive human entity, the thing that was born when Adam and Eve realized that cherubims and a whirling sword of flame were keeping the closed gates of Paradise. Mrs. Ward has power of sustained thought, judgment, balance, sympathy, observation, and information. Mrs. Craigie has wit, humor more biting than gentle, passion, and intuition. Mrs. Ward's method is punctiliously careful, her style decorous, the style of conscience and informed intelligence. Mrs. Craigie has no deliberate method, but produces out of disconnection which is all but incoherence a vivid impression of unity. Her style is too nipping, at once too polished and too reckless, to be good, and is more the utterance of capricious impulse and direct instinct than of conscience and intelligence. What she writes from page to page may be out of the line of expectation, and generally is, yet, for the moment, is surprisingly satisfactory. She seizes only the critical moment of fortune and character, and at once makes the reader a sharer of its intensity. In her people nature is heavily handicapped by the external artificiality imposed by rank and wealth; yet, with a light and scornful gesture, she casts off the weight, and shows you how impotent are the restraining trappings when once the human being is in a race for life.

To those who believe that man is but one thing permanently, and that is, unregenerate; who know and acknowledge, though it may be with tears of shame, that his abiding interest from century to century is in himself, in his own opportunity and no other, it must seem that Mrs. Craigie strikes at essential truth and dips up a bit of the heart on the tip of her light, sharp lance. The fragility, indeed frivolity, of her weapon may mislead the unreflecting as to her aim, and the apparently casual waving of her trophy may obscure its value. Besides, the fragment of truth is so unflattering to our cultured self-esteem that we may without too gross hypocrisy declare its exhibitor to be no better than a worldling and a cynic. To our mind the fragment is genuine, and would fit the heart of the humble altruist as neatly as that of the blatant egoist, of the pauper as well as the prince. It is the spark of life and the justification of existence in 'A Bundle of Life,' and in all the author's preceding work; it is the excuse for much seeming bitterness and malice. Without it Mrs. Craigie would be only a manufacturer of phrases and epigrams, providing a smile for the wicked, held in horror of the righteous, and speedily forgotten by all.

At the end of 'A Bundle of Life,' Sidney Wiche says to Teresa Warcop: "I do not know whether I love you or not; I only know that I hate my life without you." A few hours before, Wiche has been making picturesque love to another woman, yet we know that he speaks the truth to Teresa, and though, in her only great scene, she has fairly screamed with jealousy, we feel that she is a good and strong woman and needful for the completion of Wiche's successful career. Such is the art of Mrs. Craigie. Between Teresa Warcop and 'The Rich Miss

Riddell' there is pronounced resemblance of fact. Each is immensely rich, unmistakably plain, and faithful in love from childhood for ever. The similarity extends to the culminating scene in their respective stories. Miss Riddell's lover has made up his mind that her vastly superior wealth must always be an obstacle to their union, and the pressure of imminent death is requisite to wring from him a declaration of devotion. To his great chagrin death passes him by, and Miss Riddell holds him relentlessly to the bond of his supposed last words. After a lengthy discussion, she is about to abandon him when he exclaims, among other things: "Stay here, Georgie. I can't do without you." The difference in impression made by the two stories is as wide as the resemblance in circumstance is close. Teresa is created in a few pages; Miss Riddell requires a whole book of description, yet remains after all a vague, improbable image. Why Burton should want her (her wealth being no object), and, moreover, what he was going to do with her when he got her, are problems of which the author discreetly avoids attempted solution. Miss Gerard could hardly have intended to write an instructive book, yet if her novel be read immediately after 'A Bundle of Life,' few are so dull as to be thereafter incapable of perceiving that the facts selected for a foundation have little to do with the worth or beauty of the fictitious superstructure.

Early in Miss Murfree's literary career it became evident to her warm yet discriminating admirers that she was born to sketch episodes and character, not to write elaborate novels, and it was hoped by those who prize a small and perfect gift that she would return to the field where her first laurels were won. But, probably in response to a demand for magazine serials, she has persisted in the composition of long tales which are really a succession of short tales spoiled by a frail connecting thread which is constantly being lost among voluminous reports of the weather and the morning, noon, and night aspects of the Tennessee Mountains. 'His Vanished Star' includes several striking incidents and lively characters, but is a rather deplorable novel. It has no drift, no unity, no steady guiding light. At first, imagination rests on the gratuitously disagreeable architect, Kenniston. Much as it may be regretted, one feels called on to give first attention to him and his affairs. Presently he and his interests fall back, and a familiar yet ever-welcome figure, with long boots, jingling spurs, and a slouch hat, this time yclept Jack Espey, steps to the front, at once capturing attention by the announcement that the sheriff is after him for murder done in Tanglefoot Cove. After a short and brilliant run, Espey is relegated to a minor part; a new star appears in the Tennessee heavens; the mind reverts to the title of the book, and proceeds slowly to adjust itself to recognition of Jasper Larrabee, the discoverer of the star, as the real and only hero. The effort is not successful, for having got through half the book with little aid from Jasper, and none from the "gracious, supernal, stellular presence" (his star), we cannot feel that they were intended from the beginning, and resent the prominence hereafter allotted them. The failure to foresee from the beginning, and with that foresight to feel, proportion, value, interdependence of character and incident, is irredeemable failure as a novelist.

In Miss Murfree's case, failure is happily mitigated by spirited incidents and by the surprising naturalness and drollery of her mountaineers. Though she has represented or imagined (we decline positively to commit ourselves) so many, those who appear in 'His Vanished Star' are perfectly fresh, vigorous, and spontaneous. The only suggestion of weakness or concession to convention here is in the substitution of remarkably beautiful maidens for the gaunt, hollow-eyed, weary women of the early stories. It may argue a thankless disposition, but, as we could cheerfully part with all Miss Murfree's novels if that were necessary to keep even one of her stories, so we would willingly sacrifice her lovely Julias and Adelicias for one of those pinched and heart-starved women whom she pictured, as they stood, for ever holding out pleading, empty hands to the indifferent passing years.

Mr. Crockett, the Scotch author of the volume of excellent sketches entitled 'The Stickit Minister,' makes his first appearance as a novelist in 'The Raiders.' His qualities and defects are very like Miss Murfree's. He can give a swift, vivid impression of a detached incident, and fill with the breath of life characters studied by the shores and among the hills of his native Galloway, but he cannot, or, at least in the 'Raiders,' does not, link the incidents deftly, or develop the characters with any appearance of inevitableness. For a story of romantic adventure his period and scene are admirably chosen, and there are so many blood-curdling perils and critical moments, such a tangle of smugglers and gypsies and wild Highlanders, such a flourish of dirks and cracking of pistols, that the imperfect coherence is only a fault of art through which the momentary interest suffers no diminution. Besides, only Sir Walter Scott (a large exception) has given the Scotch cattle lifters, gypsies, and kindred red-handed men their proper prominence in fiction; so Mr. Crockett has the luck to offer novelty of a peculiarly stimulating kind. In both matter and style he swings to and fro between old-fashioned romanticism and modern realism, and these variations may be taken to mean that he has deliberately fashioned his novels on Sir Walter's. With due recognition of possible admiration for a master so profound as to incite to conscious imitation, we are inclined to give Mr. Crockett exclusive credit for his well-adjusted variety of manner; all the praise for versatile talent wide enough to include subtle humor and genuine pathos, broad comedy and dignified tragedy; and all the honor for the original creative ability displayed in the figure of Johnne Faa, Lord and Earle of Little Egypt.

By placing the adventures of 'Cheap Jack Zita' in the Fens of Cambridgeshire, Mr. Baring-Gould gets the advantage of a locality as attractive to the imagination and less familiar in fiction than are the Scotch Highlands. For picturesqueness, too, the nomadic Cheap Jack serves about as well as any other sort of a vagrant; and when he, or in this instance she, is announced on the title-page, one plunges in with the comforting assurance that, whatever the story may be, it is not likely to be dull. This story opens uncommonly well, catching the fancy by the Cheap Jack's audacity in plying his trade at the very doors of the minster of St. Etheldreda. Zita's first appearance, as she takes her father's place to harangue and cozen her despised general public from the front of her van, is a great success, and her spirit, shrewdness, and ready wit are sustained vivaciously through all her subsequent trials. The scene in court where she ignores the dignity of the bench and upsets its gravity is irresistibly comic, and that in the Red Wing Mill, where she seriously attempts to "make a deal" for her lover with a supposed rival, is hardly less so. Though she does herself no injustice by declaring that she is Cheap Jack to the end of her fingers, by involving her in tragedy the author shows her private integrity distinctly separated from her public unveracity and humbug, and endows her with a soul capable in emergency of scorning consideration of deals and profits. He has also rendered the Cheap Jack's point of view so sincerely and convincingly that one could hardly be sure it is not his own, unless he should answer in the negative the question with which Zita floored the presiding magistrate: "You never was a Cheap Jack, was you, your worship?"

By writing 'Claudia Hyde,' Miss Baylor has also written herself down reactionary. The home of the lady whose name breathes classic dignity and patrician estate was certainly Paradise, though geographically known as Virginia. When Gerald Mildmay, the English aristocrat (unjustly deprived of his confidently anticipated lordship, and reduced as alternative to tentative agriculture in America), enters the portals of Elysium, we fear the serpent; but no, he is a British angel directed by destiny to the very atmosphere fitted for the expansion of his wings. The intention which pervades, we cannot say animates, this novel, is so estimable that to dwell upon intrinsic improbability, upon unlikeness to human nature commonly seen, known, and experienced, seems like bare-faced iniquity. Yet it is our sorrowful duty to point out that absolutely harmonious combinations of impregnable virtue, lofty and cultivated intellect, and serenely dignified manners, are so rare as to put the guaranteed possessor beyond the accepted limit of possible mortal perfection, and to make him or her a mark for the scoff of the cynic and the mirth of the consciously imperfect. In the zeal of her effort to decry the emancipated woman, "the woman with fads, isms, cranks," the "woman who, like Samson, is pulling down the house, but by weakness, frivolity, and vice," the author has overwrought her figure of domestic virtue, has almost caricatured tranquil and refined family life, and has fairly wallowed in platitude.

Clearly, however, Miss Baylor is not hampered by any fancied necessity for drawing from life, and she is terribly addicted to fine writing. A very superficial observation of young Irish or English gentlemen would have saved her from perpetrating the wild absurdity embalmed in Flanders and Mildmay. Officers in her Majesty's service have neither the illiterate vocabulary nor the brogue of bog-trotters, and idle, athletic English noblemen do not habitually garnish their conversation with French phrases or erudite classic metaphor, such as "the Scylla of the county almshouse and Charybdis of the county jail." It must, in honesty, be noted that Mildmay fell into the classics after being domiciled with the Hydes, and that his case may have been one of mild infection from the old gentleman whose amusement it was to make scholarly criticism of Euripides, and the young lady who fed babes on spontaneous quotation from Horace. But the evidence of the whole is that Miss Baylor believes in the naturalness of her Mildmay, and that she is entirely with Claudia in perceiving about him "the *mille-fleurs bouquet* of the accomplished European gentleman, the repose of the Vere de Vere caste, the cachet of St. James." One cannot but regret the dulness of wit which condemned such a being to remain penniless when he might have made his everlasting fortune through the medium of a dime museum.

In the writing of short stories the British author has long been industrious, has occasionally risen above mediocrity, and once or twice has come near perfection. In the volume entitled 'Life's Little Ironies,' Mr. Hardy's great literary power almost triumphs over national inaptitude. For conciseness, directness, form, much is to be desired, but throughout his grasp of the subject and exposition of the idea are masterly. It is always taken for granted that his subjects and ideas shall be worth the pains of comprehension and development. Any one who may be beguiled by the title into anticipation of an hour's agreeable distraction will be much disappointed. These so-called 'Little Ironies' are, in truth, grinding tragedies, vulgar tragedies, always going on, wearing out hearts and souls, unmitigated by opportunity given for heroic pose or a transient enjoyment of enviable publicity. Irony there undoubtedly is, but it is savage, the irony of misfortune entailed by one's own act, inextricably woven with the fulfilment of the heart's desire. In addition to this irony of destiny, there is Mr. Hardy's personal irony, which does not precisely move to heart-easing mirth, and by whose unsparing use he joins to the office of narrator that of commentator and judge. "As ye sow so shall ye reap," summarizes his judgment, which is amplified by the comment, If you happen to sow like a fool, why should I sentimentalize over your folly or permit any one else the luxury of undiluted compassion? In the elimination of sentimentality from fiction, he goes further than any English novelist, and in this volume he presses that desirable reform to such an extreme that we wonder what sorrow or infirmity we might heartily pity without feeling either contemptible or ridiculous.

Mr. Zangwill vexes not his soul to unfold the mystery of pain and the futility of passion. The stories in the volume entitled 'The King of Schnorrers' are undisguisedly superficial, and meant for entertainment only. The title-story is very clever. The impudence of the Jewish beggar is so ingenious and imperturbable that it clothes him with a dignity supposed to be the birthright of kings. The rest of the volume may be labelled "warious," comprising tales of love, fantasy, and humorous adventure. They are trifling, jocular, flippant, and spasmodically clever. They assume to impart casually the liberal knowledge of a man of the world, but the real display is of the knowingness of an incorrigible gamin. As a delineator of Jewish character and customs, Mr. Zangwill is an author to be cherished, but when he goes prancing among the end-of-the-century London gentiles, he is an author whose existence is not necessary for the perpetuation of the tradition of polite letters.

Mrs. Steel's volume of stories entitled 'The Flower of Forgiveness' displays more lavishly than did her recent novel her intimate knowledge of life in the Empire of India and her feeling for the natives. She seems to see with their eyes and speak with their voice. Several, if not all, of these stories have appeared in English magazines, and are probably earlier compositions than the novel. In the art of tale-telling she is rather uncertain, being fond of a doubtful ending, and not able to insinuate delicately a satisfactory probability. But of stories to tell she has a fine lot, and a large variety of character and situation. She presents in easy succession plodding peasants, turbulent tribesmen, religious fanatics, wandering minstrels, artisans, beggars, criminals, all decreed to be what they are from the beginning of time, and almost all content to remain what they are to the end. Western discontent and unrest make but slight impression on their imperturbable, devout acquiescence in the fiat of the ages. Even their profound deference to the ubiquitous "Presence," the worshipful representative of the Empress, is tinged with contemptuous irony, as who would say, "We crawl before you because we must, but you, thing of a day, shall pass away and we, the unchangeable, remain for ever." All this feeling is given by the author through the lips of her people and the movement of her tales. Whether it is just or not, it is so strong as to seem to be truth itself, and what more than that can the wise demand of a story teller? Occasionally she diverges into direct information, into criticism of the powers, and sarcastic reference to the reformers who find Europe and America too contracted for their zeal. Her information strikes the ignorant as correct, and the powers can probably bear her criticism without flinching. As for her sarcasm, there is not the slightest danger of its depriving the Indian Empire of the services of one young man or woman whose enthusiasm in a dragon hunt can be satisfied by nothing short of a go at the hoariest antiquity.

The miners and irrigators of the Pacific Slope have had a long run in fiction, and show no signs of becoming defunct. Bret Harte's 'Protégé of Jack Hamlin's' and Mrs. Foote's 'In Exile' resound with the click of the pick and swish of reluctant water between alien banks. Mr. Harte's volume again testifies to that diminution of creative vigor which has so often of late years chilled the soul of his admirers. His persistent resuscitation of Jack Hamlin is painful. He died in his completeness. Perhaps we could have better spared a better man, but why should his poor ghost disturb a memory ever green? "An Ingénue of the Sierras" gleams here and there with the old-time brilliancy, and, thankful for that, one can afford to forget the shabbiness of its companions. Mrs. Foote's little love stories are agreeable, as love stories with the genuine ring always have been and will be, yet the only notable tale is not of love, but of wreck and the horror of slavery. It is called "The Alcazar," and is told by an ancient mariner looking down at the hulk of a weed-clothed slave-ship. It was published many years ago, we think, in the *Century Magazine*, and is instinct with a strength and elevation of imagination which Mrs. Foote has never since quite reached. By its presence a touch of distinction is added to the pleasantness of the volume.

The title-story of Mr. Perry's volume, 'Salem Kittredge,' takes precedence in quality as well as position. Though not told in dialect or adorned with startling phrases, it has the unimpeachable American birth-mark and is a distinctly original addition to our fiction. Wandering in foreign lands, Mr. Perry lapses into conventions, and it would probably be well if he should take to himself the moral of his presumably allegorical tale, "An Incorrigible Poet," and stay at home. The wisdom, in his case, of fidelity to the well known, is evident towards the close of the volume in the tale "Number Three." Here is a situation possible only in America, and beautifully fit to capture the national smile.

## A COLUMBIAN CARTULARY.

*Christopher Columbus:* his own Book of Privileges, 1502. A photographic facsimile of the manuscript. Transliteration and translation by George F. Barwick; introduction by Henry Harrisse. The whole edited by B. F. Stevens. London, 1893. Folio. New York: Dodd, Mead & Co.

In 1502, just as Columbus was starting on his last voyage, depressed with the prospect of a denial of all his supposed rights, he determined to put the record of the royal and official documents in his favor beyond the chance of destruction. He caused four copies to be made, varying somewhat in number of documents, and in the perfectness of some, and these were attested by a notary. One of these collections, on paper, less perfect than the three others, which were on parchment, he sent off to his factor to be preserved in the New World. This one has disappeared. A second was sent to the Convent of Las Cuevas, where the discoverer's body was later first laid. Our last positive knowledge of this second copy is that in one of the law-suits brought by Columbus's heirs for the recovery of his rights, in 1583, it was produced in court, as we learn from the 'Memorial del Pleyto,' where it is described as a bound volume. There is a probable later trace of this Cuevas manuscript.

In 1818 Mr. Edward Everett bought in Florence a manuscript book, to which he was attracted by the reference to Columbus in the title, but its cramped chirography and bewildering contractions prevented at that time a careful examination of it. In 1823 the Government of Genoa had directed Father Spotorno to print and annotate that one of the four copies preserved in that city, which was published as the 'Codice diplomatico Colombo-Americano.' When this book reached Mr. Everett, it reminded him of his purchase, and, in comparing the Florentine manuscript with the printed text, he found it substantially the same. The 'Codice' proved, however, to have a few documents at the end not contained in the Florentine copy. About this time, in December, 1824, he delivered his Plymouth oration, and, when printing this address early in 1825 at Boston, he added, apropos of a reference to Columbus in the text, a note, in which he described the manuscript in his possession and set forth the story of his obtaining it. This recital was not reprinted in any of the subsequent editions of that oration, but it is cited at length by Mr. Harrisse in his present introduction, wherein that writer adds: "Mr. Everett never again referred to the subject, and [his] is the only description ever made of that valuable manuscript, which has since disappeared altogether."

This is not quite true. Mr. Everett had said that Spotorno's book had been shown to him by a friend, and it is probable that this friend was the late Caleb Cushing, who, a few months later, in the *North American Review* (October, 1825), took occasion to use Spotorno's text for rehearsing the story of Columbus's life. At the conclusion of this article he gave a second brief description of the Florentine manuscript in these words:

"This curious and valuable manuscript, which we have slightly examined and compared with Spotorno's book, is of parchment, written with great elegance, and bears every mark of being from two to three hundred years of age. It begins with Pope Alexander's bull of partition, and then follow the documents which we have designated above as the first set in the *Codice diplomatico*. Another bull of Alexander copied on paper is also placed within the covers. Mr. Everett's manuscript, so far as it goes, is a much more perfect one than the Oderigo [Genoa] manuscript, as several passages which Spotorno was unable to decipher in the latter are very plain and legible in the former, which indeed is in most complete preservation. We hope Mr. Everett will favor

the public with a more particular account of his manuscript and note the variations between this and the printed copy."

Dr. William Everett, at the time the present writer inquired of him about it a few years ago, was not aware that his father had ever had or described such a manuscript, and could give no explanation of its disappearance. It is, of course, not impossible that it may hereafter come to light.

The third and fourth copies made for Columbus—the Spotorno codex being one—were transmitted to a friend of the Admiral, Nicolò Oderigo, for preservation in Genoa. That one of the two already mentioned has what is supposed to be the original binding, but apparently the other was enclosed unbound in a leather bag. This bag is now at Genoa, and is pictured in the present book. The introduction says of it that "it is the only object once belonging to Columbus which has come down to us." We might discard the Madrid armor and the pen-and-ink sketch sometimes associated with the great seaman, but had supposed the books preserved at Seville, with Columbus's annotations in them, were satisfactory "objects" of this kind.

These two Oderigo cartularies were in 1670 given by his heirs to the republic of Genoa. Some time after 1700 one of them disappeared, but was recognized in 1816 in a sale in Genoa of Count Cambiaso's library, when it was bought by the King of Sardinia and given to Genoa. This was the one used by Spotorno. It was again printed at Havana in 1867, and the Royal Columbian Commission, acting under a warrant from King Humbert, are to include it in their great *Raccolta*, now in course of publication. Meanwhile the city of Genoa has caused a few photographic copies of it to be made. This present Genoa codex is somewhat less perfect than the other now to be mentioned, and is described as being in a different hand—"more neatly and legibly written, with beautiful Arabesque ornaments by pen and brush, and many of the initial letters are artistically illuminated."

The other Oderigo copy was seen in Genoa as late as 1805, and was a part of the plunder taken by Napoleon the First to Paris, and not returned when other portions of such plunder were sent back by the allies. It was supposed to have been lost till about fourteen years ago. In 1880 the archives of the Foreign Office in Paris were thrown open to investigators, and Mr. Harrisse was one of the first to avail himself of the new privileges. Among other documents laid before him was a volume marked with the initials of the French Republic, in a binding of green morocco, which had apparently been put upon the manuscript at some time intervening between 1848 and 1852. Harrisse could discover no signs of an earlier binding; and when he found it to be a collection of the privileges, patents, and concessions granted to Columbus, he knew he had discovered the lost copy of the two sent to Oderigo, preserving in attested form the documents which in their original shape are now in good part owned by the Duke of Veragua. The finder first made known his success in his Life of Columbus, published in 1884, which was big enough to satisfy even Mr. Harrisse's luckless derision of "ponderosity."

During the Columbian year this treasure was publicly exhibited in the Bibliothèque Nationale in Paris, subsequent to which Mr. Stevens was allowed to take the negatives so effectively used in the present production. The volume before us matches in size the Stevens Facsimiles, and the reproductory leaves are separated by others containing, in an adroit way, both the extended transliteration and an English version exactly corresponding, page for page. There are also added at the end similar reproductions and elucidations of three well-known letters of Columbus, explaining his interest in this act of attestation. The book is curiously bound, in a way to suggest the period, "in half pig-skin, with plank board sides and [brass, anchor-shaped] clasps."

---

*Big-Game Shooting.* By Clive Phillipps-Wolley. With contributions by Sir Samuel W. Baker, W. C. Oswell, F. J. Jackson, Warburton Pike, F. C. Selous, Lieut.-Col. R. Heber Percy, Arnold Pike, Major Algernon C. Heber Percy, W. A. Baillie-Grohman, Sir Henry Pottinger, Bart., Earl of Kilmorey, Abel Chapman, Walter J. Buck, and St. George Littledale. London: Longmans, Green & Co.; Boston: Little, Brown & Co. 2 vols. Illustrated. [The Badminton Library.]

In all books on sport not purely in the domain of fiction, there is apt to be a sameness which becomes monotonous, but in the present work this fault is reduced to a minimum. The two rather formidable-looking volumes contain articles on big-game shooting all over the world, and in each instance the chapter is written by a man of known experience. The initial chapter "On Big-Game Shooting Generally," by the editor, is excellent as an introduction to what follows—neither made tedious by an excess of detail nor abortive by too much generalization. There are five other articles by the same author, "Big Game of North America," "The Caucasus," "Mountain Game of the Caucasus," "Camps, Transport, etc.," and "Hints on Taxidermy, etc." Of the American chapter we cannot speak in praise. Everybody who knows anything about American big game is aware that the best and in fact at present only remaining good hunting-grounds are to be found in western Wyoming, Idaho, Montana, and eastern Washington, as well as in a few remote spots in Utah and New Mexico. Mr. Wolley was actually quite unacquainted with any of them when he wrote for this book his "Big Game of North America," and the only acquaintance he had with any portion of the western United States was represented by a three weeks' hunt in a populated district of Colorado! Mr. Wolley appears to have made his home in Victoria, the capital of British Columbia, a country which, it is generally conceded, is by no means a paradise for the big-game hunter; for though there is plenty of big game there, the exceedingly dense forests which Mr. Wolley, in a moment of forgetfulness, confesses "fairly swallow a man up," make it difficult to find and more difficult to kill. Mr. Wolley's special fad appears to be to pose as a "hard" man who roams the forest in the guise of an Indian, with the silent footfall of the aboriginal hunter. In his list of camp requirements he recommends his tender-feet readers to take two spare deerskins with them to patch their moccasins! British Columbia will see few readers of the Badminton volumes who will want a single patch. One day's trial on rocky ground, we have always found, is in ninety-nine cases out of a hundred enough for men not accustomed to this footgear, prominently as it appears in their accounts of their sport. And besides, does Mr. Wolley really think that the sportsman-visitor to British Columbia will have to use up two whole deerskins for patches before he can expect to kill a deer and thus obtain a supply of patching? Mr. Wolley has quite unconsciously come nearer the truth than he knew, for, to judge by what the writer has seen of these hunting-grounds in two extended shooting expeditions, one can view more game in one day in Wyoming and Idaho than in six months in British Columbia.

By far the most readable articles, from a purely literary point of view, in the book are those on South African shooting by W. Cotton Oswell. Their charm consists in the fact that they are the true recital of personal adventure, that they treat of early days on "The Dark Continent," and tell of thrilling exploits in the most modest and straightforward way. This writer was with Livingstone in Africa, and a personal friend of his. He hunted for years in what must have been the original "Happy Hunting Grounds," and killed every kind of game found there, without the help of improved weapons and modern comforts.

The contrast is very marked between his methods and those of the author who follows him with several articles on modern sport in East Africa, F. J. Jackson. His idea of the equipment necessary for a hunting trip to those parts is so elaborate as to preclude the possibility of any but those "with money to burn" ever following his course, and the luxuries he mentions appear to the uninitiated rather foreign to the idea of the hardy hunter. In speaking of "Camp gear," he says, "Comfort in camp should be one of the first considerations," and he must have had it—a tent with floor-cloth, and bath-room attachment; iron bedstead, with cork mattress and a leather pillow stuffed with hair, and three linen cases for the same; a good bath ("and this should be an ordinary oval one with lid"—"an awkward load for a porter, and one he dislikes very much, but it is well worth taking"); mosquito curtain with calico top, etc. He also mentions that, "before having the mosquito curtains removed in the morning, it is a good thing to take a cup of coffee or cocoa before getting out of bed." Rather luxurious sport this! And when one stops to consider that all these things must be "packed" on the backs of men, he realizes the great outlay such a trip must involve. Imagine that bath-tub going through the woods! Mr. Jackson scorns a rubber one. Still, if a man can afford these things, he should undoubtedly have them on a trip which is sure to be a hard and dangerous one.

After disposing of African and American shooting, the second volume takes us almost to the North Pole after walrus and polar bear, then through all the mountainous districts of Europe and Asia, a very considerable space being occupied by articles on shooting in India by Lieut.-Col. Reginald Heber Percy; and finally closes with three eminently practical chapters on camping, rifles and ammunition, and taxidermy. With the exception noted, the book is most complete, with room for pure adventure, zoölogy, and, above all, practical instruction in hunting the various kinds of big game. One would, however, hardly sit down and read it through for the pleasure of reading.

---

*Ancient Ships.* By Cecil Torr. Cambridge, Eng.: University Press; New York: Macmillan. 1894.

Doubt is at once aroused as one turns over the illustrations in Mr. Torr's new book and fails to find among them Graser's time-honored restoration of the exceedingly uncomfortable "between-decks" of a Greek trireme. Doubt be-

comes suspicion as one reads (page 45), "There are no materials for rigidly determining the relative positions of the lines of rowers in these three-banked ships or in the larger warships." The words of the preface, "Evidence from all sources falls short of what is needed for a complete description of the ships," makes of suspicion a certainty, and Mr. Torr stands disclosed as an original worker and not a mere compiler of treatises, dissertations, and "programmes." He has in preparation a 'History of Ancient Shipping,' by which title he means a history of commerce in the Mediterranean from 1000 B. C. to 1000 A. D. The present small volume is a *prælusio* to the whole, and deals merely with the nature of the ships themselves.

In presenting his subject, Mr. Torr has followed the model of Hermann's 'Lehrbuch.' The main facts are given in coarse print, covering generally not more than half a page, or even less; the arguments and the authorities are subjoined in copious footnotes, and these notes are to the student the most valuable part of the whole. The book is not divided into chapters, but the principal subjects, indicated by the running titles, are Ships with Oars, Arrangement in Banks, Dimensions, Tonnage, Materials, Structure of the Hull, Anchors, Cables, Steering-gear, Rigging, Flags, Sounding-lead, Log, etc. Then follows an appendix in which are briefly described thirty different types of ships or boats aside from the regular men-of-war. There are full indexes of subjects and authorities, and the book ends with forty-seven illustrations, fully described, and all taken from ancient works, no restorations being admitted.

In a work like this, which may be called encyclopædic in its own little field, errors will declare themselves only after frequent consultation, verification, and use. But few of these are, we think, to be feared, for there is practically nothing here in the way of theory, and, consequently, we have for the first time a dispassionate statement of what the author has found in the original sources, and no more. He is, of course, acquainted with the modern literature of his subject from De Baif in 1536 down; but this acquaintance has taught him distrust, and in his preface he gives several amusing instances of the absurdities which abound in our manuals because the compilers have trusted their predecessors instead of going to the sources for themselves. He himself depends first upon inscriptions, chiefly the inventories of the Athenian dock-yards; second, on the literary evidence, though this, unfortunately, consists for the most part of mere passing allusions; third, upon the material sources, such as the ruins of the docks in Athens and the works of art. In using the latter he has carefully avoided, so far as he could, the danger of taking them at second-hand, and most of the illustrations which he gives are from photographs or from casts. The statements of scholiasts and ancient lexicographers he has the courage to reject altogether. The whole book, therefore, rests upon the soundest foundation, and the author deserves hearty thanks for his clear and accurate presentation of what is really known on a subject that has hitherto been obscured by clouds of words.

---

*Overheard in Arcady.* By Robert Bridges. Charles Scribner's Sons.

It would be hard to find a more attractive-looking volume than 'Overheard in Arcady,' by the well-known "Droch" of *Life*. Paper-maker, printer, illustrator, and binder have combined to achieve what might be truthfully advertised as "an elegant souvenir for a lady." The author's part in the performance is not so serious as to annoy the lady by a discovery that she is a victim of the trick of the gilded pill, nor so brilliant as to make him an object of invidious distinction to his fellow-workmen. The device of criticising authors through the medium of dialogue conducted by their own creations, passes for cleverness when worked through weekly instalments of a publication avowedly frivolous, but, between covers, the ingenuity of the device palls and its unfairness assumes proportions. This unfairness is comprehensive, affecting both critic and criticised. Among the voices in Arcady, it is easy to distinguish the authoritative one, that of Mr. Bridges, and since the opinions it utters are generally in cordial agreement with our own, we believe them to be unimpeachable. By expressing his opinions in a manner imitative of people created by Mr. Howells, Mr. Kipling, or Mr. Stevenson, the author not only loses the force which a man's own style gives to his ideas, but also, largely, the credit of the ideas. The unfairness to the authors is clear. Caricature and even burlesque of serious work are held to be legitimate, chiefly because they are provocative of laughter, but Mr. Bridges has not played the buffoon; he has, with considerable travail, just caught and caged far-off reverberations of other men's thunder.

---

*In Maiden Meditation.* By E. V. A. Chicago: A. C. McClurg & Co.

Blue sashes, white muslin frocks, and graduating-day at a young ladies' seminary would seem the natural and harmonious accompaniments to compositions written in the strain of these five essays. Not, however, because their writer has not taken pains to explain that she has "wandered among many ages and climes of literature," and not because she has failed to give the world at large her profound attention. Some of her deepest reflections occur to her while her "ball dress is thrown over the chair." In the main they might have filled the soul of Miss Pinkerton with pride if her favorite, Amelia Sedley, had written them. Becky Sharp, it is quite certain, never would have written them. The reader is adroitly put upon his mettle to distinguish between other people's thoughts and the author's own by being told beforehand that quotation marks are always omitted, on the flattering supposition that he has "wandered as widely" as the authoress herself. He is also reminded that no one can be expected to be wholly original, not even "Homer, singing the myths and traditions of olden Greece, nor yet inspired Shakspere, embodying into classic and enduring form the legends of all lands and ages." "E. V. A.'s" own method of increasing her acquaintance with literature deserves attention: "Often, when sewing or dressing, I have before me a book with marked passages, or a newspaper clipping, that I am conning again and again, or I am repeating some verse or sentiment that has struck my fancy. I believe that the most delightful and satisfactory education is gained in this way, little by little, until it is wrought in the memory, is a part of one's being, and seems but the echo of one's own thought."

The reader who elects to follow these meditations at first hand can be promised entertainment on several grounds. Like egotism in a new acquaintance, they will be found agreeable while one is taking their measure. A slight thread of personal history runs through them, of course stringing a romance. Moreover, ingenuousness, and freshness, and youthful exuberance, even when it overflows in authorship, have always their own attraction. And, finally, a volume like this grows less and less likely to be duplicated. Its sentiments are those of a departing generation, if not a departing type of womankind. Manifold influences are at work to evaporate them. No one can regret their passing, but they command something of the tenderness of feeling that a parting always momentarily brings with itself.

---

BOOKS OF THE WEEK.

A Superfluous Woman. Cassell. 50 cents.
Bennett, Prof. W. H. The Books of Chronicles. [The Expositor's Bible.] Armstrong. $1.50.
Berens, E. M. A Hand Book of Mythology. Maynard, Merrill & Co. $1.
Berkeley, Charles de. Vieille Histoire. Paris: Colin & Cie.
Binet, Alfred. On Double Consciousness. Chicago: *Open Court* Publishing Co. 25 cents.
Clédat, Prof. Léon. Grammaire Raisonnée de la Langue Française. Paris: H. Le Soudier; New York: Westermann.
Cobb, Thomas. The Disappearance of Mr. Derwent: A Mystery. F. T. Neely. 50 cents.
Conway, Moncure D. Centenary History of the South Place Society. London: Williams & Norgate; New York: Putnams. $2.
Davidson, W. L. Theism as Grounded in Human Nature. Longmans, Green & Co. $5.
Deschamps, Gaston. La Vie et les Livres. Paris: Armand Colin & Cie.
Doubleday, E. S. Just Plain Folks. Boston: *Arena* Publishing Co.
Frazer, Persifor. A Manual of the Study of Documents. Philadelphia: J. B. Lippincott Co. $2.
Fundenberg, Elizabeth H. First Lessons in Reading. American Book Co. 25 cents.
Gibbes, Emily O. Essays. C. T. Dillingham & Co.
Goethe, J. W. The Sorrows of Werther. Mascot Publishing Co. 50 cents.
Houssaye, Arsène. La Pécheresse. Paris: Calmann Lévy: New York: Charles Eitel.
Index-Catalogue of the Library of the Surgeon-General's Office, U. S. Army. Vol. XV. Universidad—Vzoroff. Washington: Government Printing Office.
Keneally, Miss Arabella. Dr. Janet of Harley Street. Appletons.
Lang, Andrew. Cock Lane and Common Sense. Longmans, Green & Co. $2.25.
*Littell's Living Age.* April—June, 1894. Boston: Littell & Co.
Maitland, J. A. F. Masters of German Music. Scribners. $1.75.
Manley, R. M. The Queen of Ecuador. H. W. Hagemann Publishing Co. 50 cents.
Marryat, Florence. Parson Jones. Cassell. 50 cents.
McKenzie, F. A. Sober by Act of Parliament. London: Swan Sonnenschein.
Nichols, Prof. E. L. A Laboratory Manual of Physics and Applied Electricity. Vol. I. Macmillan. $3.
Oman, Prof. J. C. The Stories of the Ramayana and the Mahabharata. [Great Indian Epics.] London: George Bell & Sons; New York: Macmillan. $1.50.
Pestalozzi, J. H. How Gertrude Teaches her Children. London: Sonnenschein; Syracuse, N. Y.: C. W. Bardeen.
Ramsbotham, F. S. Scenes from the Persæ of Æschylus. Longmans, Green & Co. 50 cents.
Ransom, J. U. Longman's German Composition. Longmans, Green & Co. 90 cents.
Spyers, T. G. The Labor Question: An Epitome of the Evidence and the Report of the Royal Commission on Labor. London: Sonnenschein: New York: Scribners. $1.
Stevenson, R. L., and Osbourne, L. The Ebb-Tide. Cambridge: Stone & Kimball.
Stone, Roy. New Roads and Road Laws in the United States. D. Van Nostrand Co. $1.50.
Taube, Baron G. von. Countess Janina. G. W. Dillingham. 50 cents.
The Letters of Amerigo Vespucci, and Other Documents illustrative of his Career. London: The Hakluyt Society.
The Shorter Poems of Robert Bridges. London: George Bell & Sons.
The Women's Conquest of New York. Harpers. 25 cents.
Thornton, John. Human Physiology. Longmans, Green & Co. $1.50.
Trumbull, Rev. H. C. Studies in Oriental Social Life. Philadelphia: J. D. Wattles & Co. $2.50.
Tuckwell, Gertrude M. The State and its Children. London: Methuen & Co.
Turgeneff, I. Rudin: A Novel, translated by Constance Garnett. Macmillan. $1.25.
Walton, Alice. The Cult of Asklepios. [Cornell Studies in Classical Philology.] Boston: Ginn & Co. $1.25.
Wardrop, Marjory. Georgian Folk Tales. London: David Nutt.
Waring, G. E. Modern Methods of Sewage Disposal. D. Van Nostrand Co. $2.
Walker, Prof. Williston. A History of the Congregational Churches in the United States. Christian Literature Co. $3.
Wenley, R. M. Aspects of Pessimism. Edinburgh: William Blackwood & Sons.
Williamson, Benjamin. Introduction to the Mathematical Theory of the Stress and Strain of Elastic Solids. Longmans, Green & Co. $1.50.
Williams College: A Record of the Centennial Commemoration. Cambridge: John Wilson & Son.
Willis, O. R. A Practical Flora. American Book Co. $1.50.
Wolf, T. Geografia y Geologia del Ecuador. Leipzig: F. A. Brockhaus; New York: Westermann. $8.
Woods, Virna. A Modern Magdalene. Boston: Lee & Shepard. $1.25.
Worcester, Dr. A. Small Hospitals. John Wiley & Sons. $1.25.
Wright, C. F. An Outline of the Principles of Modern Theosophy. Boston: New England Theosophical Corporation.

# The Nation.

NEW YORK, THURSDAY, AUGUST 2, 1894.

## The Week.

SENATOR CAFFERY'S speech of July 24 was the most illuminating discourse that has been pronounced on the differences between the House and Senate. Moreover, it coincided exactly with public opinion, and confirmed public suspicion in a remarkable way. Mr. Caffery had got tired of carrying the Sugar Trust on his back in addition to the sugar-planters of his own State. So he proceeded to unload the former, and in so doing he deposited the burden where all attentive observers have been convinced that it belonged—on the shoulders of Gorman and Brice. As Mr. Gorman had taken occasion to report private interviews he (Caffery) would improve the opportunity likewise. He was at a little conference at which were present, among others, Messrs. Brice and Gorman. It was decided at that conference that 40 per cent. on raw and 50 per cent. on refined sugar was proper. Then he continued:

"I took that schedule to the finance committee and gave it to Senator Jones. Mr. Jones, after a calculation, pointed out that in the differential allowed the refiners was concealed a differential greater than that in the McKinley law. I thereupon withdrew it. After further consultation I presented another schedule, placing 1 cent on raw and 1⅛ on refined. So it remained for some time when I was admonished by Mr. Gorman and Mr. Brice that this second schedule meant free sugar. Mr. Jones told us that the sugar-refining interests would favor free sugar if that schedule was insisted upon. He wanted me to accept 40 per cent. on raw and refined and ⅛ differential on refined. That schedule was not acceptable to me or the sugar-growers, and I want the country to know that *it was dictated by the refining interests.* At last we accepted it, with the understanding that the bounty provision for 1894 should stand. I call on Senators Vest and Jones to say whether what I have said is not true."

Senators Vest and Jones by their silence admitted the truth of Mr. Caffery's statement. Then the Senator from Louisiana referred in sarcastic terms to Mr. Gorman's statement of the previous day that, however distasteful the sugar duty was to him, he knew that the two votes of the Louisiana Senators were essential to the passage of the bill.

---

This was a perfectly crushing exposure. It showed up Gorman as the secret attorney of the Sugar Trust all the way through. Yet this man had made a three-hours' speech in denunciation of what he called executive interference with the Senate, affirming that he and his faction had been sacrificing their own principles and views of the public good to the necessity of framing a tariff bill that could command forty-three votes. How were these votes to be had? By yielding to the Louisiana Senators a duty of 40 per cent. ad valorem on all sugars and ⅛ cent additional on refined. Now comes the Louisiana Senator and says it is no such thing. Instead of Gorman yielding the ⅛ cent to him, he yielded it to Gorman. The sugar refineries seeking protection were not in his State, but in Maryland, Ohio, and New Jersey. That settles the whole question. Everybody suspected beforehand that Gorman, Brice, and Smith were the props and bulwarks of the Sugar Trust. Now they know it.

---

For the first time in twelve months, the July Treasury statement shows a balance to the good. The change is mostly due to the great increase in internal-revenue receipts, which have nearly doubled for the month. Great quantities of spirits have been withdrawn from bond in anticipation of a higher tax, just as, in 1890, the importations and customs receipts ran up to an enormous figure in the two or three months before the enactment of the McKinley bill with its higher duties. There can be no doubt that, if a tariff bill could be passed within ten days, importations, which are now only hand-to-mouth, would speedily take on great proportions, and the Government would have all the money it needs. There is an immense amount of goods in bond, upon which importers are drawing only to fill orders. With the tariff uncertainty brought to an end, a great trade movement would almost infallibly set in. The demand of the business community is that Congress shall make or break the new tariff quickly.

---

The *Financial Chronicle* publishes a table of our gold exports and imports for fourteen years, beginning with the year 1881. Each year is the fiscal year ending June 30. Consequently the table is complete from July 1, 1880, to June 30, 1894. The result is somewhat surprising in the smallness of our net exportation of gold, considering that we are one of the largest gold-producing countries in the world. The totals are these:

| Export 14 years. | Imports. | Net exports. |
|---|---|---|
| $566,767,791 | $494,041,410 | $72,726,381 |

During this time the country has produced, according to the reports of the director of the mint, $460,000,000 gold. The use of gold in the industrial arts during this time has been not more, but probably less, than $182,000,000. Now, if we add together the net exports and the amount used in the industrial arts, and subtract the same from the gold production of the country, we find that there has been a net addition to our gold money during the fourteen years of $204,000,000. The mint estimate of the gold in the country for monetary uses July 1, 1893, was $597,697,685. The net exports from July 1, 1893, to July 1, 1894, according to the *Chronicle*, were $4,500,000, while the gold production of the country for the same time was within a small fraction of $36,000,000, being $2,955,000 increase over the previous year, from which should be deducted $13,000,000 used in the arts. Therefore at the beginning of last month there was a net increase of $18,500,000, making a total of $616,197,685 of gold for monetary uses. This ought to quiet the fears of alarmists.

---

One Southern State holds an election this week, and another next. The five judges of the Supreme Court in Tennessee are elected in a body once every eight years, and the terms of the present bench are just expiring. To-day the people will decide between a straight Democratic ticket of five names, and a fusion ticket made up of Republicans and Populists in the proportion of four to one. The contest is of special interest for the bearing of the results upon the November election, when a Governor will be chosen. If the fusion should win this week, the Republicans and Populists would combine again for the November election; but as Harrison and Weaver together in 1892 fell 13,000 short of Cleveland's vote, a Democratic victory seems altogether probable. On Monday next Alabama elects State officers. Here also there is a combination between the Republicans and the Populists, for the Kolb faction of Democrats are now the same as Populists. The Kolbites were very confident early in the canvass, being encouraged among other things by campaign contributions from the Home Market Club of Boston, made on the advice of Senator Hoar; but they seem to have lost ground as the canvass has proceeded, and it looks to an outsider as though the coalition would meet the defeat which it deserves.

---

The Iowa Republicans have followed the example of their brethren in Kansas, and entirely ignored the liquor question in their platform. There is not even the perfunctory declaration in favor of temperance which is the last refuge of the timid politician. The incident is a striking proof of the decadence of prohibition. Only three or four years ago the party was declaring "against a compromise with the saloon," and pledging "continued opposition to the behests of the saloon power through the maintenance and enforcement of the prohibitory law." Last winter a Republican

Legislature virtually repealed that law by establishing a kind of local-option system, under which saloons may be started in any community which votes to have them; and now a Republican State convention, by its expressive silence, announces that the party has abandoned all pretence of further belief in prohibition.

---

The judiciary committee of the House has reported favorably the bill already passed by the Senate for the suppression of the lottery traffic, through national and international commerce and the postal service, subject to the jurisdiction and laws of the United States. The measure is aimed at the old Louisiana lottery swindle, which has effected a lodgment at a Florida port and taken advantage of loopholes in the statutes to revive its business throughout the country. There is urgent need that the pending bill shall be passed, for reports from many places in the North as well as the South agree that the operations of the company are already large and daily growing. The measure is so carefully drawn that it seems as though it must prove effective. The endorsement of the judiciary committee shows that there is no technical objection to it, and every argument on moral grounds is in its favor. The only hope of its opponents is that they may defeat its passage by preventing its consideration, and public opinion should declare itself so strongly for action by the House that this policy cannot succeed.

---

Josiah Quincy's National Lithographic Company at Washington has gone to smash. The hard times were too much for it—the hard times being in this case the failure to get the Patent Office printing for another year. How it got its first year's contract by a very close approach to fraud and collusion is now an old story. But Mr. Quincy's attempt to make the company out a bona-fide printing concern, with the Patent Office printing merely as an incident, looks queer enough beside the statements of the superintendent in his application for a receivership. He admits that the company never had any existence except upon paper, that only three shares of its nominal $100,000 stock were ever issued, and that even they were not paid for. Attachments and judgments are raining upon the company, the books are said to have been made off with, and there is a general scuttling on the part of all concerned. Mr. Quincy is reported to be in Boston, deliberating on the advisability of taking the nomination for mayor on the issue of reform.

---

That was an extraordinary letter from Vice-President Brooks of the Pennsylvania Railroad which Mr. Choate submitted to the Constitutional Convention on Wednesday week. The general public has long had a growing impression that the free-pass abuse was getting worse and worse, but the revelations made by Mr. Brooks will surprise even the most suspicious. A simple prohibition by the Constitution of the granting of free passes will not suffice to abolish the abuse. Pennsylvania has had such a provision for twenty years, the language of the Constitution of 1873 being:

> "No railroad, railway, or other transportation company shall grant free passes, or passes at a discount, to any person except officers or employees of the company."

Yet Mr. Brooks testifies that members of all departments of the State Government of Pennsylvania, including nearly all the judges of the Supreme and inferior courts, receive, expect, and even ask for passes.

---

Railroads that call for protection against rioters must not themselves turn rioters. The scandalous breach of the peace at Bridgeport on Thursday, in the conflict between the New Haven Road and a traction company, is only a sample of too frequent occurrences of that kind. Violence and the destruction of property and imperilling of life, to gain a momentary advantage or to win a technical legal point, are too common resorts of rival railroad corporations, and are worthy of just as severe condemnation and repression as the burning of cars and pillaging by strikers. A company appealing to the courts must come clean-handed, and must not itself be guilty of the things which it condemns in others. If there is any way of adequately punishing the men who were responsible for the outrage in Bridgeport, the city and State authorities ought not to let it slip. Law-defying corporations ought to be brought up with as sharp a turn as other anarchists.

---

The railroads are beginning to present their "little bills" to the city of Chicago. One company alone figures up a direct loss of $449,000. This is one of the invariable "next morning" results of an anarchistic debauch. A lot of fun is to be had out of it while the riot is going on, and the politicians are sitting about watching property destroyed while they are discussing the sacred rights of labor and expounding nice points in constitutional interpretation. But the "Please remit at your earliest convenience" always comes along in due time, and the courts are right there to enforce payment. The least Mayor Hopkins and Gov. Altgeld can do is to turn in their salaries to help foot the bills which their fooling with fire has brought on the taxpayers.

---

We find in the *American Architect* a clear statement of the reason why strikes nowadays always imply intimidation and violence. It was not always so. The old idea and original theory of a strike was a peaceful appeal to the facts as regards the labor market. The employer would assert that he could not afford to pay more, and that he could find men to do the work for the wages; this the employees would deny, and would quit work to see on which side the truth lay. If the master was able to get men for his money, the strike was a failure; if not, it was a success. When the Brotherhood of Locomotive Engineers first came into prominence by tying up the Eastern Railroad, they won, and won peaceably, because the company was actually unable to get skilled engineers to take the places of the strikers. But since that time the supply has so greatly increased, and strike after strike has thrown so many out of work and into other occupations temporarily, that a peaceful strike would now be nonsensical. The same is the case with nearly all other skilled trades, and with all unskilled labor. The condition of the labor market is now such that the idea of a peaceful trial of strength between men and employers is completely abandoned. Strikers hope for success at present only as they hope to be allowed to frighten or club away the men who are ready and anxious to take their places.

---

The miners' strike in the Gogebic range of northern Michigan was declared off on Sunday, after the men had been idle for six weeks and lost $100,000 in wages. This strike furnishes an impressive illustration of the harm done to workingmen by the lower order of labor organizations. It was perfectly obvious to every unprejudiced observer that the movement stood no possible chance of success. The majority of the men themselves saw this and were averse to a strike. But they were tied up in an organization a leader of which was bent on "showing his power" and insisted upon ordering them out. He has drawn good pay during the past six weeks, while they have been half starving. Yet he would be a bold prophet who should venture to predict that these very men would not be fools enough to submit to such tyranny again within six months.

---

The Berlin *Nation* points out an international effect of the cutting short of the reign of Debs. It regards the fresh demonstration of the absurdity of a general strike as bound to make a deep impression on European agitators. For years they have been mysteriously threatening to bring capital to its senses by a universal strike, until the possibility of playing such a trump-card has become one of the fixed articles of belief in the labor creed. But Debs has proved it to be an article of a falling church. The Social-Democratic *Vor-*

*wärts* admits this, while recognizing the fact that the American labor unions are stronger than those of any other country except England. But even if they were ten times as strong as they are, it says, "the proclamation of a general strike would be a blow in the water." If Debs has settled this question for Europe as well as for us, he has not been a Dictator and gone to jail in vain.

---

Very serious complications are likely to arise in the Roman Catholic church because of Mgr. Satolli's approval of Bishop Watterson's exclusion of liquor-sellers from holding office in church societies. Without suggesting odious comparisons, we cannot ignore the fact that the retail liquor business, in the Eastern and Middle States at least, is largely in the hands of Roman Catholics; and it is very probable that most of them sell liquor on Sunday. In this city it has even happened that a dealer who did not wish to sell on Sunday was driven out of business by the persecution of the police; the authorities regarding him as a wicked and slothful servant who did not put out his talent at usury and earn enough to pay his assessments. If now the admonition of Mgr. Satolli to the bishops of other dioceses is mandatory, the unfortunate saloon-keeper will find himself "between the devil and the deep sea." Deprivation of the sacraments and resulting perdition threaten him if he sells liquor on Sunday, and temporal ruin hangs over him if he does not. Moreover, the community would regard with callous indifference the consummation of the alternative.

---

To free ourselves from any charge of sectarian bias in this matter, we would call attention to certain statements made at a meeting of Protestant clergy at Saratoga. A layman, Mr. Dailey of the *Public Ledger* of Philadelphia, presented to the gathering some unpleasant facts ascertained by him during a six-months' investigation of the liquor traffic. He found that of 60,000 signers of applications for licenses a very large number were officers of churches, and not a few were officers of government. Presbyterians and Baptists were mentioned by name, and, in the Protestant Episcopal Church, "Sunday-school teachers, trustees, and thirty-seven vestrymen signed for from one to five times each." Mr. Dailey adds councilmen *galore;* but we do not attach much importance to this. As the judge said of drunkenness, according to the report in one of the oldest English law-books, in quashing a writ to remove an alderman for that failing—"that is something to which the best of them are liable." It is very clear that the Protestant clergy have some preliminaries to attend to before regarding the motes in the eyes of their Romish brethren, and it may be worth their while to see that they are not left behind in vigorous action against the abuses of the liquor traffic.

---

The conviction of Capt. Doherty and his ward-men and their dismissal from the police force are a satisfactory outcome of the testimony against them before the Senate committee, and a conclusive answer to those who have attempted to belittle the disclosures Mr. Goff brought out by saying that they contained little or no legal evidence. It is significant of the prevailing public opinion that, so far as the Tammany commissioners are concerned, the result is accepted only as evidence of their willingness to sacrifice these particular officers. To attribute to them now a disinterested desire to purify the force after their former refusals to take any notice of repeated scandals affecting officers in the department, would be such credulity as even Mayor Gilroy never expects from the public. Doherty's testimony that he reported to the president of the board the fact that a persistent law-breaker was being accepted as bondsman for her accomplices, is the first revealed link between commissioners and suspected officers. That there was a connection has never been doubted since the Senate inquiry was begun. It shows how well founded was Mr. Goff's objection to the present trials during the recess of the committee, and may have an effect on the attempts of some of the commissioners to put all the responsibility upon Superintendent Byrnes. The captain said he went to the president because he thought that commissioner could check the scandal. Why should he have supposed that Commissioner Martin would act over the head of the chief executive officer in this particular instance? And why did Martin do nothing then, so far as is known, while now, in the light of exposure, he votes to try the sergeants who permitted this irregularity?

---

The final form of the new Hawaiian Constitution, as proclaimed on July 4 by those who had dethroned a queen for doing the same thing, reveals several interesting features which show that the framers had followed current discussion with intelligence. Not a few articles are incorporated providing for what many reformers in this country have contended would be highly desirable for us. Thus the Supreme Court is made by article 40 the "sole judge" in disputed elections to either house. The President's term of office is fixed at six years, and he is not eligible to reëlection. A majority of the members elected, and not simply a majority of a quorum, is to be necessary to pass any law, which of itself would end filibustering without the need of authorizing the chairman, as he is authorized in article 48, to "count the members present for the purpose of ascertaining whether there is a quorum." Finally, Mr. Gamaliel Bradford will perceive, when he reads article 37, that his bread cast upon the waters, lo! these many years, is returning to him from Honolulu: "The members of the cabinet shall be *ex officio* members of both houses of the Legislature, with all the rights, powers, and privileges of elected members, except the right to vote."

---

For the rest, the Constitution is frankly oligarchical. The Senate is the centre of power, and the property qualification for membership in that body and for the right to vote for members is so high that it is sure to be dominated by the few wealthy people in the islands. The Senate elects the President, and when it is not in session, provision is made for an anomalous council of state with autocratic powers. The suffrage is much more restricted than under the monarchy. A special provision is made, doubtless unexampled in constitutional literature, that if the Legislature refuses to vote salaries to Government officials, the minister of finance shall go on paying them just the same. In short, there is everywhere in the document the appearance of guarding against being "snowed under by the natives, who outnumber us," as Mr. Armstrong naïvely put the case. For such an end the Constitution is a very good one, and we do not well see how a handful of men could better rule a great mass of conquered people under the forms of liberty; but surely this is not the sacred Hawaiian freedom for which so much ink has been shed.

---

Two articles of the French Government's bill for the repression of anarchists were excellently conceived. One of them calls for the solitary confinement of anarchists imprisoned under the new law. This will put an end to visiting delegations and flowers and interviews and theatrical posing. A still heavier blow is struck by the fifth article, forbidding the press to report anarchist trials. This will destroy what little glamour is left about the unlucky anarchist. Solitary confinement and trial unreported are enough to disgust any man seeking to acquire fame and do the world good by anarchist crimes. The indignant Deputy of the Revolutionary Socialist group who declared that the anarchist scare is being made use of to strangle the republic, ought not to complain. Carnot was assassinated not for private revenge, but for moral effect on the public. But the effect turns out to be, not to bring society to its knees, but to make it put a sharper edge on its guillotine, ready for anarchist necks. A party that sets about producing great moral effects, must take them as they come.

*WHERE THE PARTY STANDS.*

THE fight over the tariff bill has already lasted long enough to show where the Democratic party stands. It always takes a few days for public sentiment to formulate itself and secure expression through public meetings, the columns of the weekly newspapers, and the other channels of its utterance. Time enough for this purpose has now elapsed, and nobody can longer remain in doubt as to the sentiment of the party at large.

Indiana has always been a close State, and her politicians of both parties are keenly alive to the bearings of any new question which comes up. Gov. Matthews, the Democratic executive who behaved so energetically during the recent strike troubles, is in Washington, and brings this message from his party:

"Ninety per cent. of the Democrats of Indiana would rather have her members come back to them with the President's message and without any tariff bill, than bring home the Senate bill for which they would have to apologize from the first day of the campaign to its close."

Mr. Shanklin, editor of the Evansville *Courier*, and one of the most prominent Democratic politicians in the same State, writes that the President's attitude "is inspiring and will save our party from defeat." He reports that the indignation on account of the Senate's conduct has greatly increased since Gorman's attack upon Cleveland, and proceeds:

"The hope is everywhere expressed that the House will stand by the President to the last, refusing all overtures from the Senate, even at the peril of defeating any tariff measure. 'Better no legislation at all than the Senate bill,' is the expression heard everywhere from thoughtful Democrats. With the President, the House of Representatives, and the popular sentiment of the party on one side, and the Senate 'held up' by a half-dozen recalcitrants on the other, we should have an issue that would set Indiana ablaze with enthusiasm without any legislation at all; but if the Senate bill were passed as it now stands, we should have an apologetic campaign from the start, made all the more abject and hopeless by contrast with the splendid courage and steadfast fidelity of the President to party pledges."

The chairman and two ex-chairmen of the Howard County Democratic committee, the principal of the Kokomo high-school, the editor of the Kokomo *Dispatch*, and other leading Democrats unite in declaring their approval of the Wilson bill as passed by the House; "commend the President for his letter to Chairman Wilson"; "denounce the Senate bill as a departure from the Chicago platform and an attempt to deceive the plain, common people, who favor the Wilson bill heartily and wholly"; "denounce the speech of Senator Gorman as unworthy of any Democrat," and ask this plain question: "Why is it that the Senate bill as it stands is the best bill the Senate can pass, unless it is because you and your fellow-conspirators have utterly refused to vote for any measure which does embody the sentiment of the Democrats of the whole country?"

Democratic sentiment in Maryland found expression on Monday night in an immense public meeting at Frederick, which adopted with the greatest enthusiasm resolutions reciting the well-known facts as to the course of the "Senatorial Trust" toward tariff reform; characterizing as "foremost among these traitors to Democratic principles and these tools of corporations, monopolists, and Trusts, Arthur P. Gorman, a Senator from our own State"; cordially endorsing the Wilson bill "and the efforts of the great Democratic leader and patriot, Grover Cleveland, to carry out in good faith the platform and principles of the Democratic party"; repudiating and condemning "the Gorman-McKinley bill as designed, like its prototype, the William McKinley bill, to rob and plunder the masses of the people for the enrichment of corporations, monopolists, and Trusts"; and concluding:

"That we demand that Arthur P. Gorman resign his seat in the Senate of the United States, and give over misrepresenting an honest people in the interest and for the benefit of himself, corporations, monopolists, and Trusts; and we pledge ourselves to leave nothing honest undone to oust him from the seat he disgraces, should he fail to resign the same."

A prominent Democrat who was a delegate-at-large from his State to the last national Democratic Convention, writes to Mr. Wilson that he hopes the House will not yield, declaring that, if it should, "defeat is just as certain to overtake the party as the election comes." He says that he has been out among the people of West Virginia, and finds them in no mood to condone any trifling on the question. He adds:

"If the coal barons and the ironmongers and Sugar Trust are to dictate the policy of the party, what boots it to the people whether the Republican or the Democratic party is in power? If protection is right, let the Republicans have all the glory to be obtained by perpetuating it, but, for God's sake, let not the Democratic party surrender its principle or go over to the heresy."

Columns might be filled with such expressions of the feeling that pervades the Democratic party on this question. There is nothing to be set over against this. Not a single case has been reported in any part of the United States where a public meeting has been held or a declaration of public sentiment has been made in favor of the stand taken by Gorman and his few allies. The press of the country is substantially unanimous against them.

The differences between the Senate and the House, or, rather, between the Democrats of the House and the small Gorman "combine," involve a surrender by one party or the other. Which shall it be—the representatives of the people, or the representatives of the Trusts? No doubt is left as to how the Democratic party of the nation would answer that question. The issue should be made. We can stand the McKinley law a while longer, but we cannot afford to allow a precedent under which a few highwaymen in one branch of Congress may "hold up" a bill demanded by a majority of the people of the United States.

*DEMOCRATIC PROTECTIONISTS.*

THE attitude of such Senators as Mr. Gorman, Mr. Smith, and Mr. Caffery is in one sense surprising. They belong to a party which has long stood for a revenue tariff, and which succeeded at the last election on a platform which explicitly declared protective duties unconstitutional. But when the time comes for realizing what was promised to the people, and for actually abolishing protective duties, these men refuse to go with their party, and positively maintain that the measure now insisted on by the House is not such as good Democrats should support.

But if any one will be at the pains to read the speeches of these gentlemen, he will cease to feel surprised at their course. They reveal themselves as thoroughgoing, "dyed-in-the-wool" protectionists. It is perfectly evident that they have no conception of what a revenue tariff means, and no acquaintance with the arguments used against protection; and it is even doubtful if they could now comprehend these arguments if they tried to do so. Their whole system and mode of thinking would have to be changed before they could appreciate those elementary and fundamental principles of government which protective duties violate. Indeed, after reading the speeches of these Senators, one is rather surprised that they should be willing to consent to any reduction of protective duties at all, or to have anything to do with a party making such professions as the organization with which they have allied themselves.

Senator Caffery, for instance, declares with evident earnestness and sincerity that the duty upon sugar is not protection. The sugar industry is not "indigenous," and a tariff upon imported sugar is nothing but simple justice. Moreover, this encouragement to engage in sugar-planting has existed for 100 years, and therefore it is an act of cruelty to withdraw it. Such sentiments are exactly those which we are accustomed to hear from Republican statesmen. Senator Aldrich or Senator Chandler might adopt the speech of the Senator from Louisiana as his own, and send it to his constituents as defining the traditional policy of the Republican party. In fact, Senator Caffery's statement of the case of the protectionists is far stronger than that commonly adopted by them. They ask in a deprecating way for protection as a help to infant industries; but Senator Caffery boldly declares that the longer a duty has existed, the greater the reason for continuing it. To disturb a tax that has been imposed for 100 years is

an act of cruelty and oppression; after it had existed for 200 years, to abolish it would be no less than sacrilege or parricide.

Senator Gorman's sincerity in some of his professions has been occasionally questioned; but no one can read his last speech without being convinced that he is a sincere protectionist. He explicitly declares that he is opposed to removing the duty upon coal, because it would enable the people of New England to get coal cheaper than they now do. "From Boston east" the coal of Nova Scotia, mined by a foreign syndicate, will be exclusively used. Such a state of things is shocking to Senator Gorman. He will not consent to bring it about. Moreover, the New Englanders do not want it. They would rather burn more expensive fuel, provided it came from their own country. Senator Gorman knows the sentiment of New England, because he asked Senator Aldrich—a very astute man—whether he wanted free coal, and he said he did not. Moreover, no New England Senator has voted for it; and Senator Gorman declares positively, "Not a New Englander asks for it." He has never heard of the platforms of the New England Democrats, nor the arguments of her tariff-reform leagues, nor the demonstrations of great numbers of her most intelligent business men. He has ears only for Republican politicians and protected manufacturers. What they tell him is what the people demand.

Nor is Senator Gorman deficient in protectionist pathos. The American manufacturer does not want cheaper fuel "to the exclusion of American interests." To remove the duty upon coal would not only exclude American interests, it would also admit Canadian interests. It would benefit the Canadian treasury. Worse than that, it would bring profit to that horrid thing, a corporation. "God knows," the pious Senator from Maryland exclaims, "we have Trusts enough to deal with now." For his part he will never agree "that a foreign Trust shall enter our territory and take the substance from our people"—meaning that he is not willing that the Dominion Coal Company should sell coal in this country cheaper than the Maryland coal companies sell it.

To be sure, Senator Gorman would tolerate this iniquity, horrible as it is, provided the Canadian Government would tolerate a like iniquity, and admit coal free from the United States. In this particular his protectionism is slightly impure; but this is due to the corrupting doctrine of reciprocity introduced among the Republicans by Mr. Blaine, which is the first downward step towards free trade. With no other exception Senator Gorman is a protectionist of the straitest sect, and he will never be anything else. Senators Smith and Murphy are equally sound in the faith, but in a more practical way. They do not concern themselves with theories of political economy which they would find it painful to master. They simply say that the American people must be taxed in order that their own business may be more profitable, and that if this is not conceded there shall be no change in the tariff. This is the plain, old-fashioned "stand and deliver" protection, than which there is nothing more genuine. But what are these men doing in the Democratic galley?

## *THE WANING OF A GREAT "IDEE."*

THE Reed-Lodge idea of Republican free silver, through discriminating legislation against gold-bug countries, has been visibly wilting for some time, and the action of three Republican State conventions last week leaves it looking parched and withered enough. Indeed, the glorious author of the scheme has himself been credibly reported to be already heartily sick and ashamed of it. In his own congressional district convention on Tuesday week, at which the delegates resolved that they were "proud of the work of the Hon. T. B. Reed," they made no reference to this particular part of his work, but adopted a perfectly satisfactory financial plank, favoring "sound money, and such legislation as will give full faith and credit to all the promises of the Government." This marks a great change in the spirit of Reed's dream since his partisans in Pennsylvania and Ohio were furiously going in for forcing free silver down the throats of the nations "by discriminating legislation or otherwise."

With its very father thus disowning it, it is not surprising that this free-silver bantling was looked upon very much askance in the State conventions of Iowa, Illinois, and Wisconsin. The Iowa platform is, of course, anxious to say a good word for all kinds of financial isms, but has the root of the matter in it when it declares that there must be no use of silver inconsistent with "the permanent maintenance of equal values of all dollars in circulation." The Illinois platform is not greatly different, favoring gold and silver "upon a parity of values with complete interconvertibility," and giving no countenance at all to the Reed invention. But it was left for the Wisconsin Republicans to be true to their record for sound money, and to put forth the following outspoken and encouraging declaration: "We are opposed to any scheme that will give the country a depreciated and debased currency. We favor the use of silver as a currency to the extent only that it can be circulated on a parity with gold." This is little short of a direct condemnation of the Reed-Lodge "scheme," and probably marks its permanent retirement.

All this is particularly encouraging, as the great conception was especially devised for the West. It was thought that the East might be a little slow in taking to it, but it was expected that it would go like a prairie-fire in the West, and win Mr. Reed no end of Western delegates in the next national convention. But now we have the spectacle of old sound-money States like Pennsylvania and Ohio and Vermont running off after false gods of finance, and then being left isolated and rebuked by the unsound West. Several causes have conspired to bring this about. For one thing, the party press of any weight has never been fooled by the Reed idea, which has from the first been denounced by the influential Republican papers East and West as a plan both bad in itself and most foolish and dangerous from a party point of view. It was comparatively easy to manipulate a few State conventions and get the *Tribune* to stick its solemn old head in the sand; but with such hard things said about it by the most considerable organs of party opinion, the game was hardly worth playing any longer. Then it must have been more apparent to the Republicans of the West than it was to those of the East that the whole thing was essentially a bid for Populist support. They have had experience enough in competing in insanity with Populism. It has not helped them as a party or as a section. They have lost Congressmen and they have lost investments by it. The Reed plan might be talked about in Washington as statesmanship of a high order, but out West it was seen to be Populism pure and simple. The Populists themselves were not slow to affirm this. Here, for instance, is the *Watchman* of El Dorado Springs, Mo., saying in its issue of July 20:

> "The great change of front on the silver question by the Republicans, who have ever been as a party on all occasions in the past bitter, violent opponents of the white metal, is simply a strategic move, dictated by party policy. It is simply a trick to defeat the People's party, for they consider that party as the coming party of the future, and it is a pretty good evidence that the new party is making itself felt, and the Republican leaders know full well their chances for getting into power again will be mighty slim unless they can break the force and strength of the great ground swell now rising in favor of the People's party. The Republicans are simply trying to head off the People's party by yelling for silver at this hour of the fight; and if they thought they could win they would swear that they first put out the Omaha platform."

With such taunts flung in their faces it is no wonder that the Western Republicans concluded to leave the Populists a monopoly of their own wild notions. Thus ends the pleasant little dream which Moreton Frewen, fresh from communing at Washington with Reed and Lodge, described in the July *Fortnightly Review*. He said that the Democratic platform of 1896 would declare for free trade and free silver, and the Republican for protection and free silver. This was to be the "Titanic grouping of the contestants," and it would be strange if silver did not come to its own. But time has shown that the sound-money sentiment

of the Republican party cannot be broken at will by political intriguers to further their own ambition. The great "idee" which was to make Reed a Republican President on a free-silver platform is already discredited and declining, and will doubtless soon find its way to the historical attic where so much other political rubbish is stored.

## FRANKLIN'S "EXPLANATORY REMARKS."—II.

BROOKLYN, July 21, 1894.

UNQUESTIONABLY much of the Assembly's desire to tax the proprietary estates equally with other lands, was due, not so much to the immediate revenue it would produce, which was but a few hundred pounds, as to the wish to force the Penns to sell on reasonable terms. Owning these vast estates, the Proprietors naturally preferred to hold them till the pressure of population and scarcity of land should force up the price. So long as taxation should be insignificant, this was an easy matter, but both parties perceived that increased taxation would render this difficult, or impossible, depending on the rate at which the lands were assessed. The evils already resulting from this holding of land were dealt with in resolves nine, ten, and eleven, which are doubly interesting as showing the cause which turned the flood of German and Scotch-Irish emigrants from their natural settling-place, the democratic and religiously tolerant colony of Pennsylvania, into the Shenandoah Valley, to create there the western or dissenting party in Virginia, which brought her, though hitherto the American stronghold of aristocracy and episcopacy, into the revolutionary and democratic movements of a later period.

| RESOLUTIONS. | FRANKLIN'S REMARKS. |
|---|---|
| After the Indian Purchases made by the Proprietaries, their causing to be located and surveyed the best Tracts of Land for themselves and their Dependants, to lie waste in great Quantities for a future Market, is the Cause that our Frontiers are so thinly and scatteringly settled, whereby the poor Inhabitants there have been rendered less able to defend themselves, and become a more easy Prey to the small skulking Parties of the Enemy. | The purchasing or taking up large Tracts of Land on the Frontiers to lay by for a future Market, must prevent a compact Settlement of the People, render them less defensible, and of Course encrease the Taxes necessary for their Protection. |
| That the Proprietaries having a Monopoly of the Lands of this Province, has enabled them to hold up the vacant unlocated Lands at exorbitant Prices, and the more, as they pay no Quit-rent, but a small Acknowledgment only to the Crown, pay no Taxes for those Lands, and are under no Obligation of settling them in any limited Time. | In Virginia and Carolina the People pay no Purchase Money for their Lands, and in the former only Two Shillings, and in the latter Four Shillings and Two-pence Sterling Quit-rent per Hundred Acres. In Pennsylvania the Proprietaries Waste Lands are sold for Fifteen Pounds Ten Shillings per Hundred Acres; their Manor Lands from Fifty to Sixty times that Value, with an annual Quit-rent reserved of Four Shillings and Two Pence Sterling per Hundred Acres. This Exorbitant Price, with the great Difficulty of obtaining Justice at the Land Office, and the continued public Disputes, occasioned by Proprietary Exactions and Instructions, have driven a great Number of Wealthy Settlers into the Southern Colonies |
| That their exorbitant Demands in the Price of Lands, have driven many Thousands of Families out of this Province into Maryland, Virginia, North and South Carolina, where Lands are to be had reasonably; the Frontiers of all those Provinces being chiefly settled with | People from Pennsylvania, and who likewise carried away with them great Sums of Money, and thereby this Province has been doubly weakened, in the Loss of People to defend it, and of Substance and Improvements taxable towards its Defence. |

The eighth resolution solves a problem which must have occurred to all who have studied the 'Votes and Proceedings of the Assembly,' for that period. An apparent constant grievance, and one about which the Quaker and Lutheran fraternities were continually petitioning, was the excessive number of dram-shops and saloons. So far as my studies have gone, this was the one province in the colonial days in which this seemed to be a source of complaint. The cause for this exception is, however, made clear here. The proprietary quit-rents had been originally given to the colony for the support of the civil government. In time, however, "by the most artful Management and undue Influence," the Proprietors succeeded in reassuming these, by getting the Assembly to appropriate the license fees in their stead. In consequence, the Governor, whose salary of course depended on this fund, could never after be induced to limit the dram-shops, and a condition resulted which might well lead us to suppose that the Tammany methods of to-day are only a prototype of those of earlier times.

| RESOLUTIONS. | FRANKLIN'S REMARKS. |
|---|---|
| That from an Attachment to Proprietary Interest, and to encrease the Revenue of their Deputies arising from their Licences, the Benevolence of the People in granting the same has been grossly abused, and public Houses and Dram-shops have been encreased to an enormous Degree, to the great Corruption of Morals in the Populace, and Scandal of the Government; and that, from the same Causes, reasonable Bills presented to Proprietary Governors, for restraining or preventing this Evil, have been from Time to Time refused. | It is notorious, the Number of Taverns, Alehouses and Dram-shops, have encreased beyond all Measure or Necessity. That they are placed so near to each other, that they ruin one another; and Two Thirds of them are not merely useless, but are become a Pest to Society. There are very few of them that are able to Provide the necessary Conveniences for entertaining Travellers, or accommodating the People either in Country or City; and this is entirely owing to that weak Policy in a former Assembly, of making it the Interest of a Governor to encourage and promote Immorality and Vice |
| among the People | Many Bills have been presented to the late Governors, to lessen the Number, and to regulate those Nurseries of Idleness and Debauchery, but without success. From whence it seems evident, that so long as the Proprietaries are interested in our Ruin, ruined we must be: For no Deputy will dare to regulate this Mischief, because it will lessen the Revenue, nor accept a Compensation for this Revenue, as it will affect his successor; nor even accept a greater Annuity, because it may, in Time, encrease to an higher Sum. |

The fifteenth and seventeenth resolutions relate to an equally familiar condition of the politics of to-day, in the use of the civil service for political purposes, with a view to defeating the wishes of the very voters these public officials were supposed to serve:

| RESOLUTIONS. | FRANKLIN'S REMARKS. |
|---|---|
| That the Proprietaries contending for the Power of the appointing Judges during their Pleasure who are to determine in all Causes between the Proprietaries and their Tenants, the Inhabitants of the Province, is unjust, renders the liberties and Properties of the Subject precarious, and dependant on the Proprietary Will and Pleasure, and is by no Colour of Reason supportable. | The People of our Mother Country, under the immediate Government of a Sovereign who had little private Interest in the Kingdom to influence him, have thought that they had no Security in their Lives, Liberties, and Properties, while the Judges of the several Courts held their Commissions *during the Pleasure of the Crown*. If they were right, how much more precarious and insecure are those invaluable Blessings in this Province where so great and unjust an Attachment to the Interest of the Proprietaries is discovered, *who* are not only consulted in the Nomination of the Judges, but can, and often have, from Reasons of Policy *only*, removed them at their Pleasure? The Time may come, when the People of *Pennsylvania* may experience the arbitrary Policy of a *Richard* the Second and a *James* the Second, and the unjust and venal Determination of the servile Belknap, and the blood-thirsty Jeffries. |
| That it is the Opinion of this House that the late Militia Bill offered to the Governor was equal and just, with regard to the Freemen of the Province, and sufficient for all good Purposes. And that the sole Appointment of the Officers, insisted on by the Governor, however willing the House might be to comply with the same under a Royal Government, would be an Addition to the Proprietary Power, that by no means can be safely trusted by the People in their Hands. | However safe it may be to entrust immediate Governor's under the Crown with the Nomination of Militia Officers . . . it certainly never can be safe to commit that Power into the Hands of a Deputy of the Proprietaries, bound by penal Obligations to obey Instructions wholly calculated to promote their private Interest. If we may judge from what we have seen, they would, no doubt, commission none but those who would implicitly obey their Orders, and pursue their Schemes for enslaving the People. This would create a vast Number of new Relations and Dependencies in the Government, all under the Controul of the Proprietaries and their Governors, who holding their Offices during their Pleasure, would no doubt conform to that *Pleasure*. The Officers would influence the private Men, and the whole would influence our elections in favour of the Proprietary System, and by these Means render their will the sole Rule, in both the Executive and the Legislative Parts of Government. |

Yet another point of interest was the friction over the paper money issued by the colony. This had been emitted to pay for the protection of the Western frontier. The Proprietors' lands being, of course, chiefly in this region, the Assembly held that, as the Penns had benefited as greatly, if not much more greatly, in a property sense, by this defence, than had the inhabitants, they had no right to discriminate against the paper money, which, if depreciated, was still a legal tender throughout the colony, and in which the colonists therefore desired to pay their quit-rents and land-grant payments. The Proprietors, however, having much influence with the Privy Council (which had always been opposed to paper money), secured a decree allowing them to refuse rents tendered in paper money, and, not content with this, they ordered that all land-sale contracts made in the future should be made payable in sterling, thus forestalling the "gold clause" of to-day. But, with the depreciation already in existence, they thus, of course, in reality raised the price of their lands to just the extent of the difference then existing between the paper and sterling. This grievance was dealt with in the twenty-fourth resolution.

| RESOLUTION. | FRANKLIN'S REMARKS. |
|---|---|
| That the sole executive Powers of Government being in the Hands of the Proprietaries, together with the very extensive and growing Power arising naturally from their | No sooner did the Proprietaries obtain the Opinion of our Superiors, that the Bills of Credit should not be a Tender in the Payment of their Rents, than they laid a |

vast and daily encreasing Property, must in future Times, according to the natural Course of human Affairs, render them absolute, and become as dangerous to the Prerogatives of the Crown as to the Liberties of the People.

new Scheme for putting their Purchase Money, and other Contracts, under the same Circumstances, that thereby they might not, in common with the People of this Province, suffer by a Depreciation, in case it should happen, though in common with the People they reaped all the Advantages of those Bills, and though the Protection of their Estates, in common with the People's, render the emitting them necessary. They accordingly gave Orders to their Commissioners of Property to make their future Contracts for the Sale of Land in Sterling; and by their Instructions to their Governor, positively forbid him to pass any Supply Bill, unless those Contracts are also exempted from being discharged by the said Bills. This seems, in the Opinion of the House, to have been one of the causes of the Failure of the Supply Bill. To which may be added, that by the Bill, had it passed, the Proprietary Agents would be obliged to give an honest Account of their Estates, under a penalty of Four-fold the Tax for all Property by them wittingly concealed. But when we consider the many Instances of the most unjust Claims of Exemption from Taxes by the Proprietaries, this alone will appear an Objection likely to be strong enough with their Deputy to reject the Bill, the House having complied fully with the stipulations their Agents had entered into before the Council.

The final resolution, therefore, was one that a petition to the King be sent, begging him to reassume the entire government of Pennsylvania—a step later attempted with well-known results. PAUL LEICESTER FORD.

## GOVERNMENT AND ANARCHISTS IN FRANCE.

PARIS, July 18, 1894.

VERY few among the many people who visit Switzerland have not stopped, at Bâle, at the old hotel "The Three Kings," and from its long balcony gazed upon the Rhine running with extraordinary force under the old bridge. At the extremity of this bridge, on the opposite side which forms a sort of suburb, I remember as if it was yesterday a *brasserie* with a garden looking out on the river, and in this garden a meeting of men who were unknown to me and who did not have the ordinary look of the Swiss. It was in the time of the Second Empire. I fell quite accidentally upon this meeting of men who had come from all parts of the world; some were German, some French, some were easily recognized as Russians. The transactions of this Congress (for the meeting had assumed this pompous name) were published in the local papers. To all appearances, these gentlemen, smoking their pipes and drinking their beer, did not seem more worthy of attention than gymnasts or musicians holding their annual meetings; the quiet and innocent look of the Bâle *brasserie* contrasted, however, singularly with the character of the men who had met in it to exchange their views and to form their plans. Among them were such men as Bakunin, as Prince Krapotkin, and others whose names were then quite unknown, but who have since made themselves only too conspicuous.

These Swiss meetings, which took place with some regularity, were in fact the congresses of the school which now goes under the name of Anarchism, or "propaganda by deed" (in French, *la propagande par le fait*). There was, after the Revolution of 1848, a great outburst of socialism in France and in Germany. Many were the theories which aimed at a better organization of society; they were founded on great ignorance and great illusions, but they were doctrines, they had definite and positive objects—education, a better system of taxation, the improvement of the relations between capital and labor, a modification in the modern system of banking, etc. It was, I believe, Proudhon who invented the word Anarchy; in his paper, published after 1848, he scoffed at all the socialist schools, he ridiculed their doctrines, and took for his creed simple Anarchy, by which he meant (taking the word in its Greek sense) the abolition of all authority, religious, political, or other.

Proudhon was a powerful journalist, but his brief popularity came to an end with the Second Republic. The word Anarchy, however, was not to be forgotten. The doctrine, if the word is permissible under the circumstances, implied that a general process of destruction was preferable to any plan of reconstruction; that gradual reforms were but an illusion and sometimes an impossibility. It was perhaps natural that such a doctrine should find favor in countries which were submitted to an absolute government, where there was no free press, where representative institutions were unknown. It is not to be wondered at if anarchism found proselytes in the great Empire of Russia. Nihilism is but another name for anarchism. In his admirable story 'Fathers and Sons,' Turgeneff has given us a very vivid description of the Russian Nihilists, imbued with Occidental and half-digested ideas of political liberty and socialist doctrines. We know, too well, to what terrible means the Russian Nihilists have resorted in their war against the Russian police and the Russian Government. Alexander II., the Emperor who had proclaimed the emancipation of the serfs, became their victim; the present Emperor, though he has made it his object to introduce order in the administration of his great country, though his personal character is pure, though he is a living representative of all the aspirations of his subjects, lives surrounded by hidden enemies; his palaces are guarded like fortresses, and when he travels, troops guard the lines he goes over, from fear of dynamiters. The Russians hold a high place in the new fraternity of Anarchists; they succeeded in murdering, in the heart of Paris, in the Hôtel de Bade, on the Boulevard des Italiens, a general who was at the head of the police in St. Petersburg. Prince Krapotkin was condemned in a French court in connection with the same anarchist conspiracy, and spent several years at Clairvaux. There are always in Paris, especially in the Latin Quarter, some Nihilists, men and women, who live much among themselves, and who mix little with the French population.

The doctrines of Anarchy have found many adepts in Germany. Even as far back as 1848 the German Socialists had become very prone to revolutionary means; the attempts made against Emperor William and against Prince Bismarck proved that the great triumphs of Germany and the establishment of German unity had not pacified a school whose aims were more social than political. In France it seemed as if the establishment of the Republic, universal suffrage, an absolute liberty of the press, and the right of meeting would have given satisfaction to the most ardent partisans of social and political reform. But since the time of the first Revolution there has always been a school which has been in favor of enforcing reforms by terrorism; and what is anarchism but a new and more systematic form of terror? Dynamite and the poignard have replaced the guillotine. There is, however, a difference between the Terror of 1793 and the Terror of our times: the Montagnards had political objects, and they struck only their open enemies, or those who might be suspected of being their enemies; our modern Anarchists wish to spread terror in the whole mass of what they call the bourgeoisie; and in order to do so they do not hesitate to strike innocent women and children as well as men. Vaillant, who threw a dynamite bomb in the Chamber of Deputies, chose for his possible victims the legislators of the country, without making any difference between those who are more or less conservative and those who are more or less socialistic. He fortunately killed nobody. He may have hoped, by striking terror into Parliament, to obtain measures in harmony with his ideas. But then what shall we say of Henry, an educated man, a man of intelligence, who goes quietly to a great café, who throws a bomb into the crowd, and kills indiscriminately three people? The speech which he was allowed to make in court gives us the true essence of anarchism. Henry was a discontented, disappointed man, who declared war on a society in which he did not find the place that suited him. The war, he declares, is a war to a knife; he will not give mercy and he asks for none. His testament is the last word of the doctrine. Here we find the natural man, not such as he was painted by Rousseau, but such as he is when, renouncing all idealism, he follows only the laws of his savage instincts. "Anarchy," as it was preached by Henry, is the Corsican vendetta in a new form. It is inspired by vengeance, and the avenger thinks himself at liberty to strike the innocent; but, in Corsica, the victim must have in his veins the blood of a murderer, whereas it is enough now that the victim should belong, not to a family, but to a class, an ill-defined class, the hated bourgeoisie.

Such savage doctrines threaten the very life of a nation; they reveal under the surface of civilization a residuum of potential crime. The consternation produced in France by the attempts and the murders of Vaillant and others was so great that the Chamber, notwithstanding its socialistic leanings and tendencies, voted a law against the Anarchists; penalties were enacted against those who formed a part of associations of *malfaiteurs* (evil-doers), using or recommending violence against persons or destruction of property. All persons inciting other persons to commit crimes of murder, pillage, incendiarism, were to be considered as *malfaiteurs* and as committing an act of anarchist propaganda. The Anarchists were determined to have their revenge for the execution of Vaillant and Henry. An Italian, Cesario, chose President Carnot for his victim, and, using the favorite arm of his countrymen, the knife, instead of the dynamite bomb, he succeeded in his horrible attempt. The emotion caused by the death of President Carnot was universal. The French Chamber at once chose a new President, determined, as it was, to show to the anarchist conspirators that they had accomplished nothing in removing one man from the Presidential chair; *uno avulso, non deficit alter*. The new President, M. Casimir-Perier, is a man of courage and of energy; and the very day after his election he walked on foot through Paris. The day of M. Carnot's funeral, contrary to etiquette, he followed the hearse on foot, and headed the long procession which went from the Élysée to Notre-Dame and from Notre-Dame to the Panthéon.

The first act of the new cabinet of M. Perier

was the presentation of a new bill against the Anarchists. This bill is now under discussion in the Chamber, and though the indignation against such acts as those of Vaillant, Henry, and Cesario is as great as ever, the discussion will probably be very warm. The infractions punishable under the new law are not to be tried any longer before juries, but before police magistrates. The jurors have, in all cases concerning Anarchists, been threatened in every way, and sometimes have shown themselves too accessible to fear. The law introduces another important change: the additional penalty of transportation may be pronounced against persons condemned to a punishment of more than a year's imprisonment, or against persons having previously undergone a sentence of three months' imprisonment for the acts specified in the law, or a sentence of hard labor, solitary confinement, or more than three months' imprisonment for a common-law crime. A third change is found in a stipulation that in all cases where the incriminated act has an anarchistic character, the courts and tribunals may forbid, wholly or in part, the publication of the proceedings.

These new provisions have not been accepted by the press without some resistance. The ministerial papers themselves, considering that the law has been framed under very exceptional circumstances, after the murder of M. Carnot and the numerous crimes of the Anarchists during the last few months, propose that the law should be only temporary, like a similar law which was passed against the Anarchists in Germany some years ago, reserving to the Government the right to propose that it should continue in force, after a certain number of years. Much uneasiness is apparent in the first discussions of the Chamber. The vagueness of the law, the difficulty of strictly defining anarchical crimes, and what can be called provocation of or apology for such crimes, or an incitement to commit murder, pillage, incendiarism, have created a good deal of disturbance not only in the press, but in the Chamber. It is very doubtful if any law, any legislative precautions, will ever hinder an act like that of Cesario, who had no accomplices and was led merely by his criminal and fanatical propensities. The causes of anarchism are very deep, very widespread: the life of Crispi has been attempted in Italy; dynamite bombs have been thrown in the Liceo at Barcelona.

In the present mood of the French Chamber the law proposed by the Government will pass, probably with some amendments. I hope it will not be said of it, as was said of the law of "general security" enacted under Napoleon III., after Orsini's attempt, that the law of "general security" might easily become a law of "general insecurity." The liberal Republicans maintain that there were provisions enough in the arsenal of existing laws to allow a strong and united administration to defend itself against all the disorderly and anarchical elements of the country.

## THE LAST SESSION OF PARLIAMENT IN JAPAN.

TOKIO, June 12, 1894.

As soon as Parliament met in Tokio on the afternoon of the 12th of May, it was evident that the various schemes of the Kaishinto (Progressionists) to unite the six parties uncompromisingly opposed to the Government had borne fruit. The newspapers of the Press League had from the beginning spoken of the six parties outside of the Radicals and Independents as the "Allied Opposition Parties," and by skilful management on the part of the Kaishinto these parties acted with singular unanimity. As they mustered 130 votes against 126 of the Jiyuto, the balance of power evidently lay in the hands of about 46 Independents who refused to identify themselves with any party. How evenly this power was distributed was proved on the opening day of the Diet on the occasion of the election of the President and Vice-President. The "Allied Opposition" secured the former by a majority of only six (153 to 147), while the Jiyuto gained the latter by a still narrower majority of three (151 to 148).

This trial of strength, however, was only preliminary to a more important struggle, to which both sides determined to devote their utmost energies. The former House had been dissolved while in the process of voting an address to the Emperor in which the Government was bitterly attacked for not strictly enforcing the treaties against foreigners. The "Opposition" parties were not to be daunted by a dissolution. They proceeded to draw up a new Representation, containing even a bitterer attack on the cabinet than the former. They inveighed against the Ministers for neglecting their official duties, for wrongly advising the Emperor to dissolve the last House before it had taken any definite action, for not enforcing the treaties against foreigners, and finally for stating in a document transmitted to some of the Peers that the lower house was merely an advisory body to the cabinet. The Representation was introduced by an obscure member of one of the smaller parties, and was well debated by the representatives of all the three larger parties. The Jiyuto, however, who opposed the Representation, had the best of the argument, and succeeded in winning a sufficient number of Independents to carry the day. When finally the question was submitted to ballot, the vote stood 144 for as against 149 opposed to the Representation.

It was generally supposed that this was the high-water mark of the efforts of the "Opposition" parties during this session. The Jiyuto had been successful, and the Government had escaped by a hair's breadth from an attack that could have ended only in another dissolution. For some days the members seemed to forget the bickerings of party politics. The regular business of the session, much of which was of an extremely interesting character, was taken up; a number of important bills were passed, and even the captious critics of the foreign press in Yokohama were led to believe that the session would end without further struggle between the "Opposition" parties and the Government. Bills relating to the construction of new railways, to prison expenditure, to new harbors, to surplus revenue, to the abolition of certain export duties, and to various other matters were passed with exemplary despatch and discrimination.

But the peculiar feature of the political situation in Japan is that no party that wishes the least measure of popular success can openly support the Government. Individual Japanese may be found who will go so far as to say that the present Government had better remain in power until the existing parties have received a more thorough political training; but more than this they will not say in its support. Every political party—even the Jiyuto, to which some of the cabinet ministers are said to be friendly—must, to keep its hold upon the people, pick holes in the Government. Some local English papers have attributed this hostility to the fact that no party is at present represented in the cabinet, but it really has a much deeper origin. There is not a party but feels bound to denounce the corruption, the extravagance, or the indifference of the Government; otherwise it is branded with the opprobious title of "official party," a term for the rival parties to conjure with at the next election.

Accordingly the Jiyuto, who had opposed and defeated the Representation, had now to bring forward a measure of their own to show that they were not the puppets of the Government. They accordingly introduced various condemnatory resolutions, all of which were promptly defeated by the combined vote of the "Allied Opposition" parties and the Independents. The Kaishinto, furious because of their previous want of success, were ready to oppose everything emanating from the Jiyuto. While the sections were thus at war among themselves, onlookers were inclined to believe that the Government would escape without further collision to the end of the session. Both sections, however, felt the necessity of firing a shot at the cabinet before adjournment, and a mode of exit was finally discovered by the Kaishinto. The radicals introduced an Address to the Throne in which the Government was mildly attacked. It stated that "the ministers of state had of late years adopted measures at variance with the wishes of the nation, that such a policy was unsatisfactory to the people and contrary to the wishes of the Emperor, that therefore the ministers should shape their conduct to bring about harmony between the Government and the Diet." Cleverly taking advantage of a peculiar constitutional provision, the Kaishinto succeeded in carrying a motion to hand this address to a special committee for amendment. The President, in sympathy with the "Allied Opposition" parties, appointed a committee in which the Jiyuto was but slightly represented. The "Opposition" now had the opportunity for revenge for which they had so long been waiting. The work of the committee was merely to introduce such an amendment as would secure a small number of Independents to vote with the "Allied Opposition." Nothing must be said *directly* concerning the strict enforcement of treaties, but anything short of this was likely to command a majority of the votes of the members. The amendment finally agreed to by the committee was to the effect that the ministers of state had been particularly delinquent in the matter of foreign affairs, that they had followed a temporizing and subservient policy, which was intended only to preserve the good will of foreigners, and not to maintain the national dignity. It was for this reason, the amendment declared, that the members could not coöperate with the cabinet, and they therefore prayed his Majesty to render a decision.

The debate on the amended address was very short. The only question of importance was whether the reference to a "temporizing policy in foreign affairs" was intended to include the non-enforcement of treaties. When this question was put by one of the members, the chairman of the committee replied that those who wished to include this point were at liberty to do so, but that it was not intended to force any one's judgment. This construction of the amended address did not allay the suspicions of the radicals; they saw they were out-manœuvred by the "Opposition," and their efforts to throw out the address which had emanated from their own ranks proved in vain. By a vote of 153 to 139 the amended Address to the Throne was carried, 19 days after the Diet be-

gan its sitting, and only a few days before the session was to have ended.

The Government now began to bestir itself. In answer to the Address the ministers of state drew up a memorial which was immediately sent to the Emperor. In this document they declared that their efforts, though feeble, had always been directed, as far as lay within their power, to the welfare of their country and their Emperor; in the matter of foreign relations they declared they saw no cause for the imputations cast upon them by the members of the lower house. Finally, they prayed his Majesty to dissolve the House for its presumptuous attempt to bring discredit upon the Government The result of this memorial, in which the reasons for a dissolution were published for the first time in the parliamentary history of Japan, can easily be imagined. The Emperor refused to accept the Address of the lower house, and no sooner had this unwelcome news been reported to the members by the President, than an imperial rescript was issued ordering the dissolution of the lower house and proroguing the upper. The announcement of the rescript produced consternation. For a moment the confusion and uproar were so great that the President lost all power of control. Some members declared that stronger measures must be adopted to bring the Government to reason; others taunted the members with having brought the trouble upon themselves. At last the House rose in a tumult, and the various parties separated to concert upon further action.

As I write, however, this and all other party struggles have ceased to agitate the public, owing to the critical situation in Corea. The evident determination of the Japanese Government not to allow China to take the upper hand in the peninsular kingdom has for the first time in many years silenced even the "Opposition" organs. Jingoism is rife in Japan, but on this occasion it stands the country in good stead. The next elections take place in August, and by that time it will be clear whether the Government acted wisely or unwisely in taking this bold step. Either the Cabinet will be strengthened by success or discredited by failure; but until then little can be done by the political parties either to assist or annoy the Government. G. D.

# Correspondence.

## THE GREAT NORTHERN STRIKE.

To the Editor of The Nation:

Sir: I wish to call attention to facts in connection with the recent labor disturbances which seem to have been lost sight of—at least they have been given very little prominence in the discussions which have taken place. They would seem to rob the American Railway Union of the claims for sympathy which they have been trying to arouse on the score of Mr. Pullman's policy of declining to arbitrate the differences with his employees, and would also seem to refute the impression which they desire to create, that they are fighting for the principle of arbitration.

During the strike on the Great Northern in April of this year, engineered by this same union and conducted by these same leaders, a strike was precipitated without even giving the railroad company opportunity to confer with its men, or attempting any adjustment other than conceding their demands at once. During the progress of this strike Mr. Hill, president of the Great Northern Railway line, offered to submit the matter to arbitration—an offer which was declined, both in writing and verbally, on April 27 and 28, by Mr. Debs and his associates. That a settlement was finally effected through the intervention of a committee of the business men of the cities of St. Paul and Minneapolis does not, I think, show any change of front on the part of the Union. The committee was appointed by the business interests, and composed of men whose business had suffered seriously through the interruption to traffic, and whose personal interests dictated the necessity of immediate settlement. They simply acted as mediators, neither party agreeing to be bound by any action they might take. Their success in settling the trouble was in persuading Mr. Hill, as president of the Great Northern Railway line, to practically concede the full demands of his employees.

Yours truly, Robt. Rantoul.

St. Paul, Minn., July 24, 1894.

P. S.—I enclose clippings from the St. Paul *Pioneer Press* at the time of this controversy, giving the facts in the case.

[We print the above as confirming our reprobation of the settlement effected, in the paragraph to which a correspondent took exception last week.—Ed. Nation.]

## THE CALIFORNIA PRESS AND THE STRIKE.

To the Editor of The Nation:

Sir: In your editorial of July 12 on "The Situation in California," speaking of the attitude of the State newspapers on the strike, you say: "There does not seem to be a voice raised there in favor of order and civil government."

I wish to call attention to one notable exception to the unhappy exhibition which our journalists have made on this occasion. The Los Angeles *Times* is much the most important paper in the southern half of the State, and its position in a public emergency ought not to be overlooked in a view of the general action of the press. From the beginning of these disturbances it has taken the side of "order and civil government" with entire soundness and with marked vigor and force, thereby gaining the warm commendation of intelligent Californians. Just as the press despatches failed to make known to you the attitude of this leading paper, so it would probably appear on a further investigation of public opinion here that sympathy with lawlessness is not so general throughout the State as first reports might indicate. I am confident that in California, as elsewhere in the country, there is a sufficient fund of law-and-order sentiment at hand to answer the call of any urgent need.

Yours truly, E. S. Thacher.

Nordhoff, Cal., July 21, 1894.

[Since our article was written, we have received copies of the San Francisco *Newsletter*, containing courageous and forcible articles on the local disturbance, and a proper castigation of the anarchistic daily journals of the same city.—Ed. Nation.]

## WOOL AND IRON AS DUTIABLE OBJECTS.

To the Editor of The Nation:

Sir: In President Cleveland's letter of July 2, to Hon. William L. Wilson, he says: "Under our party platform and in accordance with our declared party purposes, sugar is a legitimate and logical article of revenue taxation." Will you kindly inform me *why* sugar rather than wool or iron ore is a "legitimate and logical article of revenue taxation"? I ask for information only, not for the purpose of controversy; and I ask you because I believe you to be the most competent person that I know to answer the question honestly.

Trusting that I may soon hear from you, I am very truly yours, S. M. Passmore.

Minneapolis, Minn., July 21, 1894.

[We presume that the President meant that raw sugar, being an article of which we import ten times as much as we produce, is peculiarly an article to yield revenue to the Government—*i. e.*, that the proportion of revenue to protection is as 10 to 1. On the other hand, we produce more wool and iron ore than we import, and hence the proportion of revenue to protection is reversed. Moreover, these are the raw materials of great industries, while sugar is not.—Ed. Nation.]

## A NATIONAL PARK IN COLORADO.

To the Editor of The Nation:

Sir: Your good word for the National Park in the State of Washington, in the *Nation* of May 31, leads me to believe you will appreciate the efforts of citizens of Colorado to establish a great national park in this State. The tract referred to, set aside by President Harrison as a "timber reservation," embraced about 1,200,000 acres, or about thirty by forty miles, lying mostly above 9,000 feet elevation, and situated between the Grand and Bear Rivers, north of Glenwood and south of Steamboat Springs, Colorado. It is a wonderfully picturesque and grand country, the natural home of deer and elk, broken up by the headwaters of many streams, which, with the lakes they start from, abound in beautiful trout. The great variety of valleys, gorges, wooded parks, and mountain sides makes this whole region a most appropriate and suitable camping-ground for the whole country. Two years ago the writer, while travelling horseback through the northern part of this reservation, saw an average of seventy-five deer, elk, or antelope a day for twelve consecutive days. We wish this game and this lovely scenery to be preserved in its native wildness for the pleasure and benefit of future generations.

Many millions of dollars will be a small estimate of the value of such a park to the United States when the nation's population numbers one hundred and fifty to two hundred million people; while, should the Government allow settlers to pick out the few choice localities for their homes, the valleys will be fenced off, the forests consumed, and the game in due time be killed or driven off. The net result to the Government could not then amount to one-tenth of 1 per cent. of the real value named above. The enclosed clipping from the Denver *Republican* of July 21 will show you how it is proposed to make the first "cut-down" in the dimensions of this grand *natural* as well as *national* park. This includes the heart as well as much of the beautifully wooded portions on the east, north, and west sides.

We need to have a universal sentiment created in favor of the preservation of these

natural advantages for the use of the whole people. Let this national sentiment be so strong that the local politician will be prevented from accomplishing his purpose in gobbling up "the world" for his particular backers. The feeling of possession of such natural scenery, such abundance of game and fish, and such unsurpassed advantages of summer camping-places for those suffering from chronic ailments, especially pulmonary ills—this feeling is something which ought by natural right to belong to every one, and I am, for one, glad to see the *Nation*, so well fitted for the task, take a lively interest in the matter.

Yours respectfully, CHARLES DENISON.

DENVER, COL., July 24, 1894.

## A YELLOW ASTER.

TO THE EDITOR OF THE NATION:

SIR: The review of 'A Yellow Aster' which appeared lately in the columns of the *Nation* contained such an able presentment of the growing tendencies to morbid self-analysis and its brood of evils that I was led to read the book out of gratitude to the review. Having read it, I now, however, am grateful to the book itself for its warm defence of innate motherly love, and for its repeated assertion that wifely affection is necessary as a preliminary to marriage as well as for continuance in that condition. Grave literary defects, even in choice of words, run throughout the novel. The parents of the heroine are theoretical monstrosities, and Gwen and her brother are as abnormal in their childhood; but they serve the lesson of heredity. Few authors have dared as much as "Iota" to prove her truism, the need of love in marriage; but because she treats her subject physiologically and psychologically, the book is deemed bad and relegated to the unhealthy purlieus of 'The Heavenly Twins.' Yet "Iota" is not dealing with man's vice, she is representing man's desire for ardent affection—a truism again, only her hero is a gentleman.

However, it is the dealing with mother-love which constitutes the power and pathos of the volume. The irreligious Gwen revolts, as do thousands of pious women, when she finds she is to be a mother; yet not for one instant does she think of being aught than a good mother to her child, as she will teach herself to so love it that it shall never experience the unloved results of her own girlhood. Gradually her growing love for her baby arouses her love for her hitherto uncared-for mother, who, while Gwen was a child, had stunted her maternal feelings that she might study science with her husband, until she, too, found the Nemesis of longing for affection awaking in her, and then her daughter did not know how to love her. There is no truer or more pathetic episode in the *Tendenz* novels of to-day than the illness and death of this mother, as she caresses her daughter's hands as if she were playing with baby fingers, while Gwen, alternately repelled and attracted, finds too late how her mother had loved her and how she could have returned the affection. The incident of the baby-basket is unconventional, but even a reluctant mother would quiver under its tenderness. Gwen's increasing fondness for her baby finally develops her regard for her husband, as being her husband as well as the father of her child.

The whole book is a protest against any stifling of maternal feeling. More than that, it declares that rebellion at the thought of being a mother does not negative duty. I thank the author for showing that a woman can never try to be "sexless," as wife or mother, without suffering to herself and to others. The conventional woman may prefer unthinking acceptance of facts, but the modern analytic girl is saved future tribulation when she comprehends that personality inheres in marriage, and that motherhood belongs to it, for love is the joy of all living. A MOTHER.

[It is precisely because "Iota" indulges in what is euphemistically called "physiological treatment" of several subjects that 'Yellow Aster' should be relegated to the "unhealthy purlieus of the 'Heavenly Twins'"; the reasons why it should be "deemed bad" were set forth in our review. One of our points was to protest against physiology in novels, partly because we believe that young girls are quite competent to find out the necessity for "love in marriage" without the aid of physiological instruction from more or less indecorous lady novelists, and even that the knowledge come by in such a way will surely do them more harm than good. Physiology in fiction is simply an offence against taste and morals, occasionally palliated by notable literary power, but never justified.

Another point in our review, and one that appears to have been very imperfectly made, was to expose the pretence of service to virtue and science made by English novelists who wish to discuss indecencies or improprieties, but do not dare to do so undisguisedly. — ED. NATION.]

## CHURCH'S CROMWELL.

TO THE EDITOR OF THE NATION:

SIR: In the course of a brief reference to Mr. Church's 'Oliver Cromwell: A History,' in the *Nation* of July 5, there is this remark: "Mr. Church occasionally quotes Mr. Gardiner in his notes, but he does not mention him in his preface, and he does not seem to be aware that Mr. Gardiner had done the work."

Is there not some misapprehension about this? I find that Mr. Church has quoted Mr. Gardiner by name thirty-six times in his footnotes, and, while he has not mentioned him by name in the preface, he does mention him in the body of the text, p. 226—a much more honorable position, and one which calls him also into the index. I find that some of Mr. Church's footnotes make distinguished mention of Prof. Gardiner, especially on page 220, where he quotes from a letter from Mr. Frederic Harrison saying that "Prof. Gardiner is our greatest living authority for the Civil War." On page 179 a very important assertion against Cromwell is disproved, and Mr. Gardiner is the authority therefor.

But has Mr. Gardiner "done the work"? Mr. Gardiner's monumental history already fills thirteen volumes, but it has only come to the death of Charles I. The greatest part of Cromwell's career has not yet been touched by him. Besides, I find this remark in Mr. Church's preface, which seems to answer the point:

"After fully exploring this vast monument of letters, it has seemed to me that a sufficient story of Oliver Cromwell and of the events which made his extraordinary career possible has not been written outside of the general histories; while, in the general histories, it is the story of England and not the story of Cromwell—the Protector appearing as one of many figures in a stirring period, rather than as the foremost man of his age."

Respectfully, LEMUEL HOTCHKISS.

PITTSBURGH, PA., July 19, 1894.

[Mr. Church, in his preface, gave it as his reason for undertaking the work that he felt the need of an estimate of Cromwell which should avoid the extremes of Hume and Carlyle. Just such an estimate is furnished by Mr. Gardiner in his 'History'; and it seems strange that Mr. Church in his preface should ignore it and regard the part of umpire as vacant. Mr. Gardiner's work has not reached the end of Cromwell's life, but the estimate of Cromwell's character is formed. Mr. Church was not accused of doing any injustice to Mr. Gardiner.—ED. NATION.]

## EXCAVATIONS OF THE AMERICAN SCHOOL AT ERETRIA.

TO THE EDITOR OF THE NATION:

SIR: The short but successful campaign of excavation conducted by the American School at Eretria, during the last three weeks in May, deserves mention in the columns of the *Nation*, not only on account of the actual results obtained, but also to enforce the moral recently laid down by Dr. Robinson in your columns, that a promising site should not be abandoned until everything has been brought to light that may prove valuable to the historian, philologist, or archæologist. In the springs of 1891 and 1892 the School had conducted excavations on this site, especially in the theatre, with gratifying results. The field was so promising, and so important for Greek history, that the director, Prof. Richardson, wisely decided again to undertake excavations there. Since the available funds were limited, he determined to strike for certain definite results, viz., (1) to learn whether the peculiar location of the theatre was to be accounted for by the presence of a sanctuary of Dionysus in its immediate vicinity; (2) whether pre-Persian remains were to be found on the Acropolis; (3) to determine the site of the famous temple of Artemis Amarysia; (4) to lay bare the main street leading to the Acropolis; and (5) to open the large tumulus east of the city. This programme was carried out with the following results.

The core of the tumulus was formed by a massive stone tower, of which three sides had fallen. No traces of a grave were found. Tentative diggings on the south slope of Kotronis, the site generally selected by topographists for the temple of Artemis, showed incontestably that no temple had ever stood there. Thus one unknown quantity is eliminated from the problem that the discoverer of this temple will have to solve. A trench (fifty feet long and down to the solid rock) that was dug on top of the Acropolis revealed no pre-Persian remains.

So much for negative results. The less speculative and more serious digging, employing from forty-five to seventy-five men, was done between the theatre and the present village. The first and, as it proved, the most important discovery was made by the men working under the direction of Prof. Phillips of Marietta. They were searching for the temple of Dionysus, and by the night of the

first day had found the foundation of the cella wall. Three courses of the foundations stand in good preservation. Quantities of charred wood and of cinders found inside the temple, and a hard thick layer of calcinated poros on the north and northeast sides, give evidence of how the temple was destroyed, and explain the absence of architectural and sculptural remains in the débris. Only one small marble head of Aphrodite was found. The large massive rectangular structure uncovered in the excavations of 1891, lying east of the temple and south of the theatre, was now seen to be the altar of the god. Nowhere in Greece can one see the group of three structures that belonged to the well-organized worship of Dionysus—temple, altar, and theatre—so well preserved as here.

Unfortunately, the other excavations had to be left unfinished. A long stretch of the ancient street, lined with private houses, was uncovered, but much remains to be done. Doubtless one might find here important data for the construction of the Greek house, for the foundation walls seem to be preserved everywhere. It is especially to be regretted that the work on the theatre could not be finished. This theatre, now famous in the history of the stage controversy, was partly excavated most opportunely in 1891, and at once furnished much aid and comfort to the advocates of both sides of the question. The stage-buildings twelve feet above the level of the orchestra, on the strength of which Mr. Gardner contends that the Greek theatre had a high stage; the tunnel leading to the centre of the orchestra, which Dr. Dörpfeld believes to be distinctly in favor of the opposite view; the vaulted passage under the scena, which neither Dörpfeld nor Gardner has explained satisfactorily—these are some of the peculiarities of this theatre about which controversy rages. It is clear that if an answer to these problems is to be found, it must come from the building itself, for excavation has already shown that at least the ground-plan of the structure can be recovered.

Something was done this year. The foundations of the west part of the scena buildings were uncovered, and a long line of column bases on which once stood choregic inscriptions and tripod columns. The outer wall of the west parodos was excavated throughout its whole length, and the fact was established that this parodos, unlike the other, ascended from the level of the orchestra at a very steep grade. It seems at least probable that this parodos was practically closed to the spectators, and that herein we have an explanation of the vaulted passage.

Much remains to be done on the theatre, and must be done by the Americans if they wish to be looked upon by archæologists as thoroughly competent and conscientious excavators. Dr. Robinson said a good word to this effect about the excavations at the Heraion; it applies also to Eretria. Dr. Dörpfeld takes his large company of scholars of all nations each year to Eretria to see this theatre, and also to Megalopolis. I can testify that the clean work of the English School contrasted strongly with that of the American, and was noticed and commented on by all. A few years ago we had a first claim on the thousands of tombs, rich in archæological material, some of which Dr. Waldstein opened with marked success. Now the enterprising Greek Archæological Society has undertaken this work on its own account, and a unique opportunity for archæological discovery has passed from our hands. But there is plenty of work left to be done in Eretria. The whole site is teeming with ruins a few feet under the surface. It is earnestly to be hoped that the American School will be able not only to finish the work at Argos, but to continue that at Eretria, so as to leave the latter site as creditable a monument to its archæological activity as the former bids fair to be.

EDWARD CAPPS.

ATHENS, July 15, 1894.

## DISCOVERIES IN CRETE.

TO THE EDITOR OF THE NATION:

SIR: The explorations of Dr. Halbherr in Crete, under the auspices of the Archæological Institute of America, have met with interesting and important results since my report upon them before the New York Society of the Institute in April. Dr. Halbherr has been directing his attention especially to prehistoric and Mycenæan remains, where so much has been hoped for in Crete, and where these hopes are now finding their fruition. The extent and significance of his discoveries may be seen from the substance of a letter which I have just received from him. He says:

"My recent explorations have extended from the heights of Camares, upon the southern slopes of Ida, as far as the mountains of Lassithi toward the provinces of Pediada and Rhizokastron. After the partial examination of the necropoles of Curtes and Camares, I made an important investigation in the necropolis of Erganos, where I searched three beehive tombs of the Mycenæan epoch, one of which was quite intact and completely preserved. It contained the remains of six bodies with all their funeral furniture, consisting of a varied collection of Mycenæan vases, almost unharmed, and in the original position in which they were deposited a thousand years before Christ. These were all gathered after their position had been noted, careful plans were made of the tombs, and the best preserved skulls were deposited in the Museum at Candia, where they will serve for the study of the race which spread the Mycenæan culture in Crete. The importance of this discovery is enhanced by the fact that no necropolis here has ever been studied before with scientific accuracy. Now we have the materials from Camares, Curtes, and Erganos for the first essay upon these primitive remains in Crete, and for considerably advancing the question of the Mycenæan culture in the isles of the Mediterranean.

"Besides this, I have discovered two towns hitherto unknown. The one is that to which the necropolis upon the mountains of Erganos belonged, the other a large city situated upon a height between Lyttos and Tnatos. The former was rather poor; the latter has furnished me with some inscriptions, one of which was archaic, and also a good harvest of fragments of fine Mycenæan vases and of archaic Greek pottery with representations in relief. I obtained here also some small prehistoric or Eteocretan stones, bearing new syllabic signs which connect them with the discoveries made recently by Mr. Arthur J. Evans of the Ashmolean Museum, Oxford (see the London *Athenæum* of June 23). I too have turned my attention to the study of this prehellenic writing of Crete, and am adding some contribution each day. During the past week I have entered in my list two new signs on two stones discovered at Vorus, near Phæstus.

"We have also explored a grotto near Lebena, where some vases were found similar to those called Theran (often placed about 2000 B. C.), some objects in stone, and a prehistoric habitation. In another grotto situated on the slopes of Ida, a large number of fragments of very ancient pottery have also been gathered."

The interest of these finds for comparison with those of the Athens school at the Argive Heræum will be apparent to any one familiar with the problems involved.

A. C. MERRIAM.

LONDON, July 18, 1894.

# Notes.

IN conjunction with the Société des Bibliophiles of Guyenne, the family of Montesquieu began, two years ago, putting into print some unpublished works of their illustrious ancestor, leading off with 'Mélanges inédits.' A second volume, being the diary of a tour in Austria and Italy, is on the eve of appearing, and extracts from it are already allowed to see the light in the French press. Those given in the *Débats* of July 11 show Montesquieu in the unfamiliar rôle of an art critic.

There was some discussion last spring in London as to whether the English publisher of Mr. Butler's translation of Count Nigra's collection of letters of Cavour and the Countess de Circourt ought to describe the contents of his edition as "now first printed," when M. Roux, the Roman publisher, had some time before brought them out in their original French form. We catch glimpses in the volume of the Countess's husband, Count Adolphe de Circourt, a man of exceptional parts, who passed through life, however, almost unknown. In his introduction to the letters, Count Nigra mentions a biography of Count de Circourt which was privately printed in 1881 by the latter's friend, the late Colonel Huber-Saladin of the Swiss army. A few copies of this rare book are still in the possession of the author's son, M. William Huber of Paris, who is disposed to present them to public libraries or important private collections.

We had anticipated the conclusion of Dr. Billings's great 'Index-Catalogue of the Library of the Surgeon-General's Office, U. S. A.' with the fifteenth volume, but we had reckoned without the letter W, which, with some addenda, perhaps, will claim a sixteenth. The fifteenth, somewhat thin in bulk, yet quite up to the average in the number of periodical articles recorded, ranges from Universitad to the end of V. One notices, in passing, the extraordinary richness of the library in documents pertaining to universities, but the titles which surpass all others and easily make a volume are Uræmia, Urea, Urine; Urethra, Uterus, Vagina, Venereal; Vaccination, Varioloid; Varix, Veins; Ventilation, and Vivisection. Vaccination is classified historically by countries, and all the bitter controversy over it, as over Vivisection, may be read in these close-packed entries. There is nothing new to say of this splendid and enormous labor, whose "explicit" will soon be written.

'Fair Women,' by William Sharp, is the "monograph" of the July *Portfolio* (Macmillan). It is a piece of elaborate fooling and more or less poetic rhapsody hung on the peg of an exhibition at the Grafton Gallery, and serves as an excuse for the reproduction of a number of female portraits, ancient and modern. These are welcome, especially those after Luini's Leonardesque and subtle "Portrait of a Lady" and Sir Joshua's charming "Snake in the Grass."

There is little in Ruskin's 'Letters to a College Friend' (Macmillan) to justify their publication. They show some of the traits of the future Graduate of Oxford, his positiveness, self-contradiction, industry, and Turner worship, but they are for the most part in a jocular vein which is not very funny now. His essay on the question "Was there Death before Adam fell, in other Parts of Creation?" has a very far-away air, and his instructions, after Harding, as to the proper foliage touch in chalks seem equally remote from this generation. Neither is the magic style of the author

of 'Modern Painters' visible in these early letters, and it is difficult to see that anything would have been lost to the world if they had remained unpublished. Their only interest is biographical, and there is not much of that.

M. Paul Flat gives us a second volume, 'Seconds Essais sur Balzac' (Paris: Plon, Nourrit & Cie.), for which one may well feel grateful, so substantial and satisfying is his study of the great novelist. A large part of the book is devoted to an examination of Balzac's philosophy, always an interesting topic. The admirable table of contents greatly facilitates reference. In his two volumes M. Flat has made a worthy contribution to the "literature" of his subject.

'Les Lundis d'un Chercheur' (Paris: Calmann Lévy) is the latest contribution to bibliography of that eminent authority the Vicomte de Spoelberch de Louvenjol. The book was begun before the three great histories which have made M. de Louvenjol's reputation, and is composed of articles of different lengths upon unexpected discoveries on interesting points in bibliography. Gautier, Vigny, Sand, Musset, Baudelaire, Féval, are some of the authors treated of in this volume.

Firmin-Didot & Cie. have issued the first volume of M. J. J. Jusserand's "Histoire littéraire du Peuple Anglais." This volume covers the period from the Origins to the Renaissance, the second will take the reader to the time of Pope, and the third and last from Pope to the present day.

The Librairie des Bibliophiles has brought out an edition of Florian's 'Fables,' with the "Avant-propos sur la Fable" prefaced to the volume. Florian is not La Fontaine's equal, but he is a very charming fabulist, and this edition is welcome.

M. Jules Lemaître is not only a brilliant critic, he is, as every one knows, a dramatist and a *nouvelliste*. His latest volume, 'Myrrha, Vierge et Martyre' (Paris: Lecène, Oudin et Cie.; New York: Dyrsen & Pfeiffer), is a collection of very short tales of various epochs and different countries, in all of which the attractiveness of this author is felt. "Le petit Racine" and "La Cloche" may perhaps be specially picked out.

'Vieille Histoire,' by Charles de Berkeley (Paris: Armand Colin et Cie.), is quite sufficiently entertaining to make it worth reading. It is a good average novel, resembling the ordinary English production, especially in the lack of the sensual element. There are plenty of pages which can be skipped and leave the real story untouched; the characters are somewhat sentimental, and the tone is rather of the young-girl order.

The 'Grammaire Raisonnée de la Langue Française' of M. Léon Clédat (Paris: Le Soudier; New York: Westermann) is a very interesting book. It is, to begin with, a valuable exposition of the grammatical forms of the language from a scientific standpoint and in clear, precise language. Next it is an arraignment of the needless complications and difficulties introduced at various times by grammarians usually ignorant of the history of the language they were engaged in regulating. A very large part of the book is occupied with phonetics, and is evidently inspired by the desire—or, more exactly, determination—to bring about a reform in orthography. M. Clédat makes out a very strong case for the reformers, whose recent failure to enlist the Academy's sympathy has evidently not daunted them, for both he and M. Gaston Paris, who has written a solid and thoughtful preface to the work, are resolved to continue the attack until victory crowns their efforts. As for the second part of the grammar, which treats of flexions and syntax, it is simply admirable, and certainly no one studying French seriously can afford to be ignorant of what M. Clédat has to say. The 'Grammaire' is one of the most valuable scientific contributions to this class of literature which have appeared for many years.

It is seldom that the dust of historical libraries blossoms into such a pretty romance as that which forms a prefatory note to the first paper in the July number of the *Pennsylvania Magazine of History and Biography*, "Journal of a Volunteer Expedition to Sandusky, from May 24 to June 13, 1782." This was the military adventure against the Ohio Indians which ended in the awful torture of the commander, Col. Crawford, one of whose aids was Major "John Rose," a Russian nobleman who had volunteered in the service of the colonists during the Revolutionary war. A great-grandson of this interesting and respectable character, Baron George Pilar von Pilchau, one of the Russian delegates to the Chicago Fair last summer, was directed to the rooms of the Pennsylvania Historical Society, in Philadelphia, where he astonished the librarian "by taking from his pocket a package containing the original drafts of some of the letters" being shown him among the "Irvine Papers." On his return to Russia, Baron von Pilchau forwarded this Journal, which possesses a decided historical value, and a photograph of his ancestor, Gustavus H. de Rosenthal, which is reproduced in the *Magazine*.

The first number of a new literary periodical entitled *Euphorion*, "Zeitschrift für Literaturgeschichte," and edited by August Sauer, has just been issued by C. C. Bucher in Bamberg, Bavaria, at four marks a number. It is intended to supply the place of Seuffert's *Vierteljahrschrift für Literaturgeschichte*, and Schnorr von Carolfeld's *Archiv für Literaturgeschichte*, the former published by Böhlau at Weimar and the latter by Teubner at Leipzig. *Euphorion* is intended to embrace the whole field of literary research from the close of the middle ages to the present time, and will comprise essays of a general character, special studies, important contributions in the form of letters, diaries, archival documents, texts, criticisms, and bibliographical communications. Although chiefly German, the periodical will be somewhat international in character, and will include brief reports on American, English, Russian, Hungarian, and other foreign literatures. In the present number the articles are signed; hereafter they will all be anonymous.

The official organ of the Bureau of the International-Copyright Union, *Le Droit d'Auteur*, is issued at Berne on the 15th of each month, under the able editorship of M. Henri Morel, the director of the bureau. It furnishes reliable summaries of the copyright movements of the world, learned essays on interesting questions relating to the legal protection of literary and artistic property, analyses of copyright decisions, together with much else that is of permanent worth relating to a subject of growing importance. Of special value for present use as well as for future reference are the texts of copyright statutes, and related ordinances, which are printed in full, in French, and include not only all legislation since the formation of the Copyright Union, but, in the case of some countries, all the copyright laws in force. To this important material the editor has now furnished a special index covering all the legislative documents printed from 1888 to 1893, inclusive. It is quite certain that within a few years copyright must assume in the United States something of the importance ascribed to it abroad, and the prudent librarian should prepare for that time by securing a complete file of this periodical before the back numbers are exhausted.

An apparently well-informed writer in *Blackwood* for July sounds a note of alarm in respect to the Senussi confraternity of Mohammedans. Its founder was a native of Algiers, a descendant of the Prophet, who, after preaching reform throughout northern Africa, retired about the year 1845 to Jerbum. This is a small walled town in an oasis in the Libyan desert, about 400 miles west of Cairo and on one of the principal caravan routes between the Mediterranean coast, the central and western Sudan, and Egypt. Here he built a *zawia*, or convent, and devoted the rest of his life to the organization and propagation of his order. In 1859 he died, first nominating as his successor his son Mohammed es Senussi, at the same time hinting that he was to be the Mahdi. Up to this time the son has lived in strict seclusion in Jerbum, "a mystic being enshrouded in an atmosphere of saintliness." His missionaries, however, have gone through the regions west of the Nile valley, establishing countless zawias, in which the priesthood are the political as well as the spiritual leaders. Their methods are as yet entirely peaceful and conducive to the prosperity of their followers. They promote agriculture, open wells, plant crops, and cultivate date-palms. Only in Egypt and the Nile valley has the order failed to establish itself. The great interest in this wave of religious feeling which has swept over so large a part of Africa is in the possibility of a change in its character.

"The Partition of Africa," by Mr. A. Silva White, in the *Nineteenth Century* for July, is a not very clear or convincing discussion of the Uganda settlement and the recent Anglo-Congo agreement. In criticising the Government for its lack of vigor in respect to Uganda, and especially for its refusal to build a railway from the coast, at least part way to the Lake Victoria, he shows what seems to us an absurdly exaggerated estimate of the value of this country to the English. He even goes so far as to assert that, if it had been abandoned, the English hold upon Egypt "would have been undermined," apparently forgetting that, though this region is the Nile source, more than 1,500 miles of at times absolutely unnavigable waters lie between it and the Egyptian frontier. Very doubtful, also, is his statement that the retention of Uganda by the English involves "the pacification of the Sudan," or, in other words, another costly expedition against the Mahdists. In his treatment of the protests against the Anglo-Congo agreement Mr. White has little difficulty in proving the weakness of the French position, as well as its inconsistency in the light of the occupation of Tunis and their more recent operations in the Hinterland of the German and English possessions in West Africa. The article is accompanied by an admirably clear map showing the present political divisions of the continent.

The article in the *Nineteenth Century* in January last by Dr. Mills on Zoroaster excited much interest in Bombay. A request has been made by a Mr. Coorlawalla, a prize essayist of the local Sir J. Jejeebhoy Zend College, to allow the article to be translated into Gujrati. Consent has been given, and the article will be published in a large edition by

the Trustees of the Sir J. Jejeebhoy Translation Fund.

We cannot speak from personal acquaintance as to the fidelity of the imperial-panel photograph of Chief Engineer George Melville, U. S. N., just published by F. Gutekunst, Philadelphia. The character which has won such a position, however, and which distinguished one of the heroes and historians of the ill-fated *Jeannette* polar expedition, is clearly visible in this powerful and attractive head.

—From the statistics of illiteracy in the United States in 1890, it appears that, of the total population ten years of age and over in 1890, 12.4 per cent., or one-eighth, were illiterate. Ten years earlier a similar proportion was 17 per cent., or about one-sixth, showing an immense reduction in the proportion of illiterates. This reduction has taken place in the ranks of the native-born whites and of the colored, while among the foreign-born the proportion has increased. Thus, the proportion of illiterates among the native whites was in 1890 6.2 per cent., and in 1880 8.7 per cent. Among the colored the corresponding proportions were 56.1 per cent., and 70 per cent. Among the foreign-born, on the other hand, the proportion of illiterates in 1890 was 13.1 per cent., and in 1880 12 per cent., an increase to be accounted for by the excessive immigration of the decade and by the character of much of that immigration, which consisted of the lower classes of southern and eastern Europe—Italians, Huns, Poles, and Bohemians. The illiteracy of the country is therefore mainly represented by the foreign-born and the colored elements, and by the latter in much greater degree than the former. Considering the entire population, the States in which illiteracy is most prevalent are those of the South. Mason and Dixon's line, the Ohio River, and the thirty-seventh parallel of latitude separate the literate from the illiterate States. North of that line the proportion of illiteracy ranges from 3.1 in Nebraska up to 12.8 in Nevada. South of that line it ranges from 14.6 in the District of Columbia to 45.8 in Louisiana, if we except Oklahoma, which was largely settled from Kansas and carried Kansas education with it. Indeed, throughout the cotton States the proportion ranges high, being 40 per cent. in Mississippi, 41 in Alabama, nearly 40 in Georgia, and 45 in South Carolina. In the Northern States, throughout New England and the upper Mississippi valley, the average is between 5 and 6 per cent.

—Analysis shows that the colored people of the South measurably offset the foreign-born of the North. The distribution of illiteracy among the native whites is in its broader features quite similar to that of the total population. The North contains a very small proportion of illiterates, ranging from 0.8 per cent. in Nevada up to 6.8 in Missouri, while in the South, again leaving Oklahoma out of consideration, the proportion ranges from 5.9 in Maryland up to 23.1 per cent. in North Carolina. The proportion of illiterates among the native whites of the Western States and Territories is smaller than anywhere else, with the exception of New Mexico, where it is larger than in any other State or Territory, being not less than 42.8 per cent., owing, of course, to the presence of the large Mexican population. Among the foreign-born the proportion ranges in those States where this element is significant from 7 per cent. in Washington up to 26 in New Hampshire. It is very high in New England—much higher than in other of the Northern States, owing to the large number of French Canadians. It is low in the West and Northwest, where the foreign element mainly consists of Germans and Scandinavians. The colored inhabitants of the Northern States have a much smaller proportion of illiterates than those of the Southern States. In the North the average is not far from 30 per cent., while in the South it is probably nearly or quite double that proportion. Among the cotton States it ranges from 50 per cent. in Florida to 72 in Louisiana. In Mississippi, Georgia, Alabama, and the Carolinas it ranges between 60 and 70 per cent.

—One of our correspondents has been so lucky as to fall in with a little leather-covered book, like those of bank depositors, which contains Daniel Webster's autograph record of his legal receipts. This chronicle fills twenty-eight pages, and extends a little more than from 1833 to 1836 inclusive. The first entry, dated September in the former year, is of $50, and the second of $20, for retainers on the New Hampshire circuit. The first fee of $1,000 was paid in May, 1834, by a Mr. Badger. Services regarding Cilley's will commanded $800. The total amount for the first year was footed up as $13,140, with the remark, "September 22nd, 1834, thus done and concluded." A similar summing up appears at the close of each other year. The second total is $15,-183.74; the third is $21,793. The first entry of $2,000 was in 1835, March 7; the first of $3,000 December 7 in the same year. This last payment was in respect to Florida land. The largest single honorarium was $7,500. In February of the fourth year $5,000 is set down as bestowed in a case of Trinity Church (N. Y.). In turning over this record leading metropolitan and even provincial lawyers are astonished that Webster, already twenty years in Boston, so undervalued his services. He learned better at last. When Robert C. Winthrop looked at the earliest date, he said, "That's just the time that I was ending my studies in Webster's office," and the chirography led him to add that Webster never wrote a firm hand. Nobody has surveyed the relic with more interest than Dr. O. W. Holmes. Among other things he said: "Had the influx been tenfold, Webster's purse would have remained empty still. Had its capacity received like the sea, whatever entered there would have run off like water from the back of a duck."

—Petrarch once was at pains to explain to Boccaccio that he had forborne to read Dante for fear of unconscious imitation. Whatever Petrarch may or may not have done unconsciously, of conscious imitation there is in his work no end. Frankly, the *Canzoniere* are just a new orchestration, with a few original variations or cadenze introduced, of the 'Vita Nuova'; the dependence of the *Trionfi* upon the 'Commedia' is obvious; and the identity of development of the whole theme from a comparatively human love-song in the 'Vita Nuova' and 'Canzoniere,' through moods of ever more and more mystical unction up to the final pietistical pæans of the "Paradiso" and the *Trionfo della Divinità*—this identity needs no proof but assertion. It has remained, however, for two Italian scholars, Prof. G. A. Cesareo and Signor A. Moschetti, working simultaneously but quite independently, to expose the details of this intimate relationship between the duumvirs of Italian poetry. Prof. Cesareo's monograph, which appeared in a recent number of the *Giornale Dantesco*, shows up more especially the formal and stylistic indebtedness of Petrarch to Dante. Signor Moschetti, in his separately published pamphlet, lays stress rather on the Dantesque inspiration of the *Rime*. Certainly the counts against Petrarch are numerous and strong. We are made to see him at his desk with the 'Vita Nuova' before him, sugaring, watering, and refining upon its condensed and rugged motives very much as Liszt worked up Hungarian folk-songs into grandiloquent rhapsodies. If, as is true, the crises of his passion occur in exactly the same relative order as those of Dante's, at least there is originality in the very different virulence and duration of these, as it were, sympathetic attacks. This difference appears very nicely in the comparative number of verses in which the several crises are described. Thus, the intense subjectivity and frankly human passion of Petrarch expand the more personal portion of his work, the *Canzoniere*, into 331 sonnets and other poems; whereas the corresponding portion of Dante's work, the "Vita Nuova," amounts all told to barely 31 sonnets and poems. The 'Commedia,' on the other hand, the especial masterpiece of the divine theologian and all too Platonic lover, is about five times as long as the *Trionfi*—among the laborious heights of which, if truth must be told, the now corpulent Petrarch appears somewhat sluggish and scant of breath.

—The student of mediæval culture has reason to be grateful to Dr. Sutter for his monograph, 'Aus Leben und Schriften des Magisters Boncompagno' (Freiburg i. B., 1894). He had already shown his mastery of the intellectual and spiritual movements of the thirteenth century by an excellent work on Giovanni Schio of Vicenza, and this companion volume will not detract from the reputation earned by its predecessor. All accessible sources of information, printed and manuscript, have been ransacked to throw light upon the somewhat erratic career of the forgotten worthy whose renown in his time stood high as professor of grammar and rhetoric at the University of Bologna, and who deserves the place assigned to him by Dr. Sutter as one of the precursors of the Renaissance. Investigators of the legends of the Wandering Jew will find here the earliest description of that individual in an old man whom Boncompagno met in Jerusaem, claiming to have been with Pontius Pilate when Christ was crucified. This doubtless explains the legend, for the credulity of pilgrims to the Holy Sepulchre was so industriously exploited that there probably was almost always there some ancient impostor to personate the immortal vagrant. Though Boncompagno had no faith in the story, he was sufficiently a son of his period to embody in his treatise on rhetoric the ascription of the origin of letter-writing to the Ark, when a message on a laurel leaf conveyed to a son of Noah the suggestion that he should cover the nakedness of his father. The "Rota Veneris"—a series of examples of the art of love-letter writing—of which Dr. Sutter gives us an abstract, throws a curious light on the easy morals of the time. As a whole, the little volume is well worth the attention of scholars, who will find that the author's lightness of touch renders it pleasant reading in spite of its solid learning.

—'The Home Life of the Ancient Greeks,' translated from the German of Prof. H. Blümner by Miss Alice Zimmern (Cassell Publishing Co.), is a timely publication well adapted for intelligent readers of all kinds, as well as for

use by classical students. The original constituted vols. lx.–lxiii. in the series entitled "Deutsche Universal-Bibliothek für Gebildete," and is the work of a thorough scholar and antiquarian, editor of the third edition of Hermann's 'Griechische Privataltertümer.' Its scope is distinct from that of Guhl and Koner's 'Life of the Greeks and Romans,' which is strictly an illustrated treatise on antiquities. The special merit of this book is that it sums up, in a clear and consecutive narrative, whatever is known on such topics as costume, birth and infancy, education, daily life within and without the house, public festivals, agriculture, trade and handicraft, slavery, etc. These and kindred subjects are treated in the several chapters in a manner which, while free from superfluous technicalities, is trustworthy and accurate, so far as the constant progress of antiquarian discovery will permit. For example, a reproduction of the beautiful theatre of Polycleitus at Epidaurus would have been preferable, as a type of the genuine Greek theatre of the best period, to Strack's restoration of the theatre at Segesta, p. 397; and the description of the stage as raised ten or twelve feet above the orchestra certainly needs some qualification, in the light of recent exploration and theories. The illustrations, without being artistic, are well chosen and sufficient for the purpose. The translation is in some respects an improvement on the original. It is more accessible, being furnished with headlines and a good index, which the original does not possess. Moreover, Miss Zimmern's English is clearer, neater, and more straightforward than the German, presenting substantially the author's meaning without his repetitions and divagations, for the learned author often permits his sentences to sprawl and twist with that casual clumsiness which the German public mildly tolerates and the French so sternly represses. One small speck we notice in glancing over the chapter on slavery, p. 525, where the rendering "At Athens the *hangman*" (*Henker*) is liable to convey the false impression that hanging was customary in Athens.

—The late Bruno Piglhein, who died at the age of forty-six on the 15th of July, is a great loss to the new school of artists in Munich. He was the first president of the new society of Bildende Künstler, formed by the 160 "secessionists" who lately rebelled against the discrimination against foreign exhibitors. In this country Piglhein's name was first made known by the copious reproductions of his humorous pastel of a little girl and dog, seated, with their backs to the spectator, over a stream; which was turned into a clever cartoon called "Jack and Me" during the Blaine campaign in 1884. A spurious cyclorama of the Crucifixion, which he vainly tried to suppress by legal process, further served to draw attention to him here. Piglhein began by failing in his chosen specialty of painting religious panels. He then turned to the trivial treatment of slight and meretricious subjects and succeeded. When success was once assured, he returned to his old love. He came to Munich after having failed as a sculptor in Hamburg and Dresden, and spent ten long years in painting saints and madonnas, most of which returned to his studio unsold. One large picture of the Crucifixion, which was exhibited in Munich and Dresden in 1878 and 1880, was so roughly handled by the critics that Piglhein gave up the attempt and fled from his creditors to Paris. When he returned after a few years, he brought with him some daring pastels of actresses and painted women which found instant admirers. Then followed an endless series of similar pastels and of chalk portraits of children, all of which were distinguished by their bold execution and richness of color, so that within a few months Piglhein had risen to be the acknowledged master of the pastel in Munich. His tricks of style were copied by hosts of imitators, and eagerly studied by the students who flocked to his studio. At this same time, "for himself," as he expressed it, the artist was painting sombre pictures with religious subjects, which were never put on sale. In 1886 an offer from an English firm for a large cyclorama painting, leaving the choice of subject free, gave him the chance to return to his old field. Once more he painted the Crucifixion, and had the satisfaction of receiving praise where he formerly had encountered nothing but derision. The Royal Academy of Munich made him an honorary professor, and when the art war broke out in that city, his large painting of a blind girl groping her way through a flaming field of poppies was at once pronounced the *chef-d'œuvre* of the rival exhibition. This picture, it is safe to predict, will rank as his masterpiece, though it may never attain a reproduction like that which fell to the lot of the original of "Jack and Me."

## LUDLOW'S MEMOIRS.

*The Memoirs of Edmund Ludlow*, Lieutenant-General of the Horse in the Army of the Commonwealth of England, 1625-1672. Edited, with appendices of letters and illustrative documents, by C. H. Firth, M.A. 2 vols., pp. lxix, 548, 571. Oxford: Clarendon Press; New York: Macmillan. 1894.

THIS new edition of Ludlow's Memoirs by Mr. Firth contains passages heretofore suppressed. They are of little importance, being, not historical revelations, but reflections on the character of Shaftesbury, struck out by the first editor because Shaftesbury had at that time redeemed himself in republican eyes by turning against the court. Still, they make the memoir complete and authentic. But the most valuable features of this edition are the introduction and notes.

To readers whose ideas of the Cromwellian period and its characters are taken from Carlyle, Ludlow is known as "solid Ludlow," "wooden Ludlow," a man who could not have the divine spark in himself since he failed to recognize the divinity of Cromwell. Ludlow unquestionably was a heavy man, an obstinate man, and a man of one idea. His idea was abolition of monarchy. Whence his republicanism was derived—whether, like that of Marten, from the classics, or, like that of Harrison, from the anti-monarchical passages in the Old Testament—hardly appears. Probably it was from the former. He was, like many of the revolutionary leaders, a wealthy gentleman, and had been educated at Oxford, where, as we learn from an anecdote in the Introduction, his dogged pertinacity of opinion had already been displayed. Hatred of monarchy was his guiding star. With his eye fixed on this, he was blind to all beside—to the tyranny, corruption, and violence of the Rump, to the need of amnesty and reconciliation after the Civil War, to the practical fruits of the Revolution, offered together with toleration and national greatness by the Protectorate, to the monarchical tendencies plainly manifested by the people, and to the necessities of successive situations. Consequently he earned by his fractiousness and perversity a conspicuous place in the purgatory of those political suicides who largely helped the Cavaliers to bring about the Restoration. His political fanaticism formed a counterpart to the religious fanaticism of Harrison. It is due to him at the same time to say that his devotion to his idea, his integrity, his disinterestedness, and his fortitude seem to have been not less unquestionable than his wrong-headedness. In the field he approved himself a stout soldier and a trustworthy officer, though he was not fit for high command. He seems also to have upheld the humanities and courtesies of war. In his Irish campaign, it is true, he stifled a band of natives with smoke in a cave, anticipating thereby the Algerian exploits of Pélissier and St. Arnaud. But in Ireland it is the literal truth that the general who only put to the sword the inhabitants of Drogheda and Wrexford when they had refused to surrender, was the most humane commander on either side.

Ludlow is, of course, vehemently anti-Cromwellian from the moment when Cromwell became the "Single Person"; and his prejudice casts back a lurid light on the whole of the Protector's career, which he imagines to have been one long intrigue, pointing to the ultimate usurpation of supreme power. It happens that this hypothesis at all events is decisively confuted by one fact, the significance of which Carlyle would hardly have failed to note had he not been dazzled by the general glory of the Cromwellian Shechinah. It was after the death of the King, when the summit of Cromwell's ambition must have been full in his view, that he married his eldest son, Richard, to the daughter of Mr. Mayor, a private gentleman, negotiating strictly, though not covetously, about the settlement, and seeming to care for nothing so much as that the family with which he connected himself should be religious. It is hardly possible that Richard can have been at that time in his father's mind the destined heir to a crown or even to an hereditary Protectorate. Probably the best key to the enigmas of Cromwell's career is the assumption that he had not so much of forecast as he had of sagacity in deciding the question of the day, but was borne on by the current of events which carried him at last to supreme power. It was not to be expected that he should wear his heart on his sleeve. When the prospect of supreme power began to open, he sounded those about him and felt his way. This was not insidiousness, but common prudence. There is nothing to convict him of treachery towards any one, or of apostasy from any cause. He was a soldier of the religious rather than of the political movement, and had never, so far as we know, pledged himself against monarchy, though he had drawn his sword to put an end to the High Church tyranny of Charles and Laud. Nothing seems more certain than that, at the close of the first civil war, he did his best to make terms with the King. It was apparently only Charles's fatuous reliance on his own indispensability that prevented Cromwell's design of restoring him from taking effect, and drove Cromwell himself into the arms of the extreme party in the army, which, when Charles had a second time kindled the flames of civil war by his intrigues, resolved to take his life. Cromwell, though his mind cleared as he rose, was never free from fanaticism or from the moral self-delusion and tendency to cant which attend it. But he owed his supremacy to necessity, which led him by the hand from step to step; not to forecasting ambition or crafty intrigue.

Ludlow shared, if he did not start, the belief that the calling and dismissal of the Barebones Parliament were a stroke of Crom-

well's satanic cunning. The scheme was, it seems, by setting at work an assembly of extremists who would assail the law and the church, to frighten the lawyers, the clergy, and the conservatives generally into Cromwell's arms. Cunning so deep Satan himself might have envied. The Barebones Parliament comprised the most respectable representatives of Cromwell's own party, the Independents. These men, we are asked to believe, Cromwell brought together with the deliberate intention of discrediting them by failure and then estranging them by dismissal, in order that he might conciliate the precarious support of men who hated them and him; as though the hollowness of the bugbear would not have appeared and its efficacy have ceased as soon as the assembly had dispersed.

Ludlow's prejudice is, in fact, such as to deprive him of all value as a witness against Cromwell:

"Cromwell," he says, "having been disappointed, as I formerly mentioned, in his endeavours of procuring a civil authority to countenance his arbitrary power, made it his business so to balance all interests that they should not dare to oppose him, for fear of bringing themselves into a worse condition than that wherein they were. To this end he gratified such of the Presbyterian party as were the most complying, and courted divers of the nobility, particularly the Earl of Warwick, whose grandson was admitted to be a suitor to his youngest daughter. But because that this alliance was not at all grateful to some persons about him, he contrived to appear averse to the match; and then by the management of Sir Edward Sydenham it was brought about that the young couple were married without the knowledge of their parents: for which contrivance Sir Edward was for a time forbidden the court."

This, as Mr. Firth observes in the Notes, can scarcely be correct, inasmuch as it appears from Thurloe that the match was publicly negotiated and publicly celebrated. The parish register of St. Martin's-in-the-Fields shows that the banns of marriage were three times published, and "Mercurius Politicus" says:

"This day the most illustrious lady, the Lady Frances Cromwell, youngest daughter of his Highness the Lord Protector, was married to the most noble gentleman, Mr. Robert Rich, son of the Lord Rich, grandchild of the Earl of Warwick and of the Countess Dowager of Devonshire, in the presence of their Highnesses, of his grandfather and father, and the said Countess, with many other persons of high honor and quality."

The insinuation that Cromwell rejoiced at the death of Ireton, and the story of the programme for his funeral having been borrowed from that of the funeral of Philip II., are probably instances of the same credulity of hatred.

Justice at the same time requires us to say that Ludlow's resistance to the Protectorate was straightforward, manly, and dignified. He frankly avowed to the Protector his intention of taking advantage of any fair opening that might present itself for a return to his own political ideal. But in the meantime he did not intrigue or plot. Conspiracy with royalists and schemes for assassination would have been abhorrent to his honest nature. Some of Cromwell's critics have treated the plots as creations of Cromwell's secret service, got up to excuse arbitrary measures and to warrant confiscation. Ludlow affects no doubt of their genuineness. Was it Cromwell's secret service that got up the murder of the Commonwealth's ambassadors, Ascham and Dorislaus, or that of the regicide Lisle?

With the most questionable of Cromwell's acts Ludlow was not the man to reproach him, for we may be sure that his own hand was set to the death-warrant of the King with far less misgiving or compunction than that of Cromwell. Carlyle never was more mistaken than in saying that the execution of Charles gave flunkeyism a blow of which it has gone about sick ever since. Flunkeyism throve and has continued to thrive on the royal martyrdom. There are churches in England dedicated to Charles the Martyr, there are no monuments to James II. Vane protested against the execution of Charles, whose son requited him with judicial murder.

That Cromwell's government was a government of the sword, as Ludlow passionately complains, was true only in this sense, that it was supported by military force, as every government must be which emerges from civil war, though the soldiers in this case were not mere musketeers and pikemen, but the flower of English citizens in arms for a great cause. But Ludlow's "civil power" was the Rump. On what, except on military force, had the authority of the Rump rested? What was Pride's Purge but a triumph of military force over civil power? No one could show less desire to make the sword the permanent instrument of government, when order had been once restored, than Cromwell.

The strongest point which Ludlow makes against the Protectorate is in regard to its foreign policy. Cromwell's alliance with France against Spain, he says, upset the balance of power in Europe and paved the way for French domination. The criticism seems justified by the event. But Ludlow wrote after the event, under the Restoration; and it was to the ignominious and corrupt policy of the Restoration, which made England subservient to France, that the event was due. Had the policy of the Protector continued in force, England, instead of being subservient to France, would have been the ally of the Dutch Republic against French aggrandizement. Of the two Catholic powers, France was the more liberal, while Spain was the Apollyon of Protestants, and her decline, though it had set in, was still masked by the hugeness of her frame. It is true that Spain was also the richest and easiest prey, and that the Cromwellian policy, like the enterprise of the Elizabethan rovers, had in it a filibustering strain.

In the last agony of the Commonwealth, after the death of Cromwell, Ludlow remained faithful to his idea, and exerted himself most strenuously (and, if we were to grant the truth of his hallucination, not without sagacity) to bring about its realization. Heroically he struggled for the reinstalment of the Rump, which alone, in his eyes, possessed legality, and which for him retained indefeasible authority and unquenchable existence; its decimation by military force, the death of the King by whom the Long Parliament had been called, expulsion, and the subsequent existence of a totally different government with Parliaments of its own, all notwithstanding. The case was pretty desperate, as Cromwell seems to have felt when he omitted to execute, or destroyed, the deed nominating his successor, and only faltered Richard's name *in articulo mortis*. Yet had the opponents of the Restoration been wise and united, they might have averted the catastrophe. Richard, though feeble, and perhaps, in Puritan eyes, loose, was not idiotic or disreputable; personally he appears to have been popular, and he was free from the stain of regicide. He seems to have been amenable to guidance. An able Council of State, with a patriotic Parliament elected under a republican test and an army true to the cause, might have got along without disaster. There would have been nothing in an hereditary Protectorate more incongruous than an hereditary Stadholderate, while the monarchical cravings of the nation might have been satisfied. Mazarin and Don Louis de Haro, most competent judges, regarded the Protectorate as established, and Monk, also a most competent judge, was apparently of the same mind. From the Anglican hierarchy the people, as we learn from Pepys, were completely estranged. The royalist rising under Booth was put down with great ease; and Monk found it necessary at last to creep to his mark very cautiously and under a cloud of lies. But the opponents of the Restoration were as far as possible from being wise or united, and the result was that Ludlow, peering out of the window of the lodging into which he had withdrawn, saw the troopers of the Commonwealth return from escorting Charles Stuart. The soldiers seem to have contracted the professional character of a standing army, and to have lost in part that of soldiers of a cause. Yet the Court, till the army had been disbanded, restrained its vengeance and kept on its mask.

Ludlow the regicide, as an exile in Switzerland, where he was nobly protected by the native government, continued to be regarded as the head of the Republican party in England, and was accordingly the mark of Royalist assassination, to which his fellow-exile Lisle fell a victim. But for the leadership of conspiracy he was ill-qualified. After the Revolution of 1688 he appeared in England, but only to find that, though Stuart despotism had been overthrown, the hatred of regicide Republicanism was little abated, and that there was no part for him to play on his old political stage. The "Single Person" was as firmly established as ever in the popular superstition. Could he have foreseen the future, he might have been comforted by knowing that William III. was the last king who would govern, while behind him came a procession of phantoms who would only reign; so that practically the Commonwealth had won. If his foresight could have extended to Mr. Keir Hardie, he might have flattered himself that even the formal realization of his ideal would be merely a question of time.

## LILLY'S CLAIMS OF CHRISTIANITY.

*The Claims of Christianity.* By William Samuel Lilly. D. Appleton & Co. 1894. 8vo.

THIS is an attractive volume in its externals, and is not without interest to the reader, for its subject is of supreme importance, the writer is thoroughly in earnest, and his style is vigorous, though sometimes incorrect and occasionally marred with undignified colloquialisms. Yet one cannot but feel a certain amount of compassion for an author so zealous whose acquaintance with his subject is so superficial, and who is unable to convey a clear conception of his object. Apparently this is to show that Christianity is the true universal religion, and that it can manifest itself as such only through the Catholic Church with the Papacy at its head. To accomplish this, he devotes a third of the volume to Buddhism and Islam, and then considers the vicissitudes of the Church through the middle ages, the Renaissance, the Reformation, and in modern times; but the mode of treatment is so discursive and the book consists so largely of quotations from writers of all kinds, mostly modern, with the author's comments on them, that it leaves no clear im-

pression on the reader of having any definite purpose, and rather suggests that it is a promiscuous emptying of a commonplace-book of elegant extracts pieced together after a fashion.

Mr. Lilly is too honest to gloss over the dark spots in the career of the Papacy—its degradation in the first half of the tenth and eleventh centuries, its secularization and immorality in the fifteenth, and the intolerable abuses of the curia which no Pope, however well intentioned, could reform. This honesty affords an insight into the curious paralysis of the reasoning faculties which seems to afflict those who surrender themselves to dogma, and who can reconcile with divine order the human depravity of pontiffs whom they regard as the visible representatives of God. This inability to frame a logical connection of ideas runs through the whole work. We are told (p. 55) that "toleration is essentially a modern notion," and in defining (p. 157) the "three kinds of freedom," freedom of conscience is omitted. Mr. Lilly admits and deplores in several passages the persecuting spirit with which the Church has always, when able, crushed schism and heresy, and yet he tells us (p. 105) that it was the destined work of Gregory VII. "to rescue liberty of conscience," and he perpetually (pp. 87, 236, 240, 243) insists that the Church is the champion of the rights of conscience. The reader who reflects on the Inquisition of Spain and Italy, or even on the measures through which Clement XI. and Innocent XIII. enforced the bull *Unigenitus* on the Gallican Church, may well ask himself whether some new definition is to be assigned to the words toleration and freedom of conscience.

Similar intellectual color-blindness is observable in Mr. Lilly's objurgation of the German princes of the Reformation and of Henry VIII. for resuming the powers exercised by Constantine and Charlemagne. Constantine, it appears (p. 86), was "sagacious" when he made the Church an affair of State, but when Henry VIII. did the same thing, it was "the finishing stroke of Tudor absolutism" (p. 205). Both monarchs acted from purely selfish motives, and an ordinarily rational writer would not have allowed his imagination to be controlled by the accident of the ownership of the ox that was gored. In this case, however, allowance should perhaps be made for deficiency of knowledge, for Mr. Lilly evidently is not aware that the principle which he denounces so roundly, *cujus regio ejus religio*, was the accepted doctrine of the Church in the time of St. Optatus. This deficiency of knowledge is further apparent in his remark (p. 118), "Dante describes Constantine as founding his new capital on the Bosphorus that 'he might give the Shepherd room.' Whether or not this was his intention in the transfer of the seat of empire, such unquestionably was its result." He evidently does not know that Dante only voiced a current notion derived from the forged Donation of Constantine, and is oblivious of the fact that the Western Empire lasted for a century and a half after the founding of the new Rome.

Mr. Lilly tells us that he writes as a publicist, and perhaps this may explain why he has so little to say as to the supreme function of religion as the teacher and guardian of morals, and why he seems to have little conception of it as a force making for righteousness. He admits that the Ages of Faith, which he so earnestly admires as exhibiting the practical realization of the "Claims of Christianity," were also ages in which "the firmest faith and the grossest corruption of life . . . were found united in the same person" (p. 134). There is nothing shocking to him in this dissociation of faith and morals so long as the faith is the true faith; but when he comes to treat of Protestantism, he employs a different standard, and resorts to sweeping *a priori* assertions of which he does not and cannot give a scintilla of evidence. Thus (p. 192) he tells us that "The Antinomian doctrine of justification which he [Luther] fabricated was productive of far worse results in the lives of men than had been the traffic in indulgences so strongly denounced by him"; and again (p. 212), he speaks of Protestantism as resulting "in the decay of the moralities essential to the maintenance of civilized life." Before committing himself publicly to charges so serious, a self-respecting writer would have examined a little into facts, and would have readily learned from statistics that in Vienna 50 per cent. of bir hs are illegitimate, in Graz 62 per cent., in Berlin 15 per cent., and in London 4 per cent., while Rome, with 44 per cent., still holds the preëminence which Mr. Lilly admits (p. 160) it enjoyed in the fifteenth century, of being the most dissolute city of Italy. Far be it from us to follow his example and to assume, from these figures, that our Catholic brethren are immoral because they are Catholics, for it is well known that the Irish Catholics are the chastest race in Europe; but facts so readily ascertainable should restrain even so emotional and inconsequential a writer as Mr. Lilly from evolving such figments from his inner consciousness, and from sneering (p, 70) at "the mild virtues of the British 'lower middles,' the peculiar tenderness of the Nonconformist conscience."

We might proceed indefinitely with illustrations of Mr. Lilly's incompetence to handle the great subject with which he has grappled, but these will probably suffice, and we will only add a comment on a matter which possesses interest beyond his method of its treatment. In one of his discursive excursions he maltreats violently the late Mr. Symonds for aspersing the Society of Jesus, and makes a special point (p. 176) of his "amazing blunder" in repeating the accusation that in the Society sin must be committed at the command of a superior. With a somewhat elaborate display of learning, he explains away the passage in the Constitutions (p. vi., cap. 5) on which the charge is usually based, but a little more familiarity with Jesuit rule and practice would have preserved him from this fruitless labor. An earlier clause in the Constitutions (p. vi., cap. 1) prescribes that the inferior shall abnegate in blind obedience his own judgment and opinion as to all commands of a superior, unless he can define that there is sin in them. Defining a sin in anything, under the Jesuit system of probabilism, is by no means an easy matter, and is especially so in the commands of a superior, for the most rigid of Jesuit moralists, the General Thyrsus Gonzalez, declares that the subject must abandon his own opinion and accept that of his superior as righteous, while the construction placed on the rule of obedience is explained by La Croix, who says that even if the command is wrongful, the subject in obeying it only incurs material sin (that is, nominal sin, which is not an offence to God) and avoids the greater evil of insubordination. This was not the teaching of the other religious orders. Father Sayre, who was a Benedictine, and Father Marchant, who was a Franciscan Recollet, say that, if an inferior feels doubt as to the innocence of a command, he must not obey it while the doubt exists; conscience holds the first place, and obedience is due only for what is licit.

## JUSSERAND'S PIERS PLOWMAN.

*Piers Plowman:* A Contribution to the History of English Mysticism. By J. J. Jusserand. Translated from the French by M. E. R. Revised and enlarged by the author. London: Unwin; N. Y.: Putnams. 1894.

M. JUSSERAND is well known as an enthusiastic student of English literature and English life in the Middle English and Elizabethan periods, and as the author of several valuable works on these subjects. In the original, the present volume is linked to a preceding study —translated by Miss Toulmin Smith as 'English Wayfaring Life'—by the general title "Les Anglais au Moyen-âge," but this title is left out in the English version. Like Miss Toulmin Smith's translation just referred to, the book before us is an authorized rendering, revised by M. Jusserand himself, and may fairly be called a second edition. The notes are much fuller than those in the original, and there are a number of really illustrative pictures. The translation is thus a better "state" of the work than the French edition.

After an excellent sketch of the historical background of the poem and a sufficient analysis and account of the three versions in which we have it, M. Jusserand proceeds to an examination of "the author's name, life, and character." According to M. Jusserand, the author's name was William Langland, not Langley. He was born a serf. His father being too poor to educate him, he was enabled to learn "clergy" by the benefactions of friends, and contrived, illegally and perhaps fraudulently, to take orders. Taking orders was *ipso facto* emancipation, and this explains the language of Holy Church when she tells William that "she received him first and a free man him made."

"The friends of the poet died. They disappeared, perhaps, during one of those terrible epidemics that swept away whole villages. Being young, strong, and full of hope, he must have kept his illusions some time longer. But little by little the lights faded and the clouds grew darker. Isolation, poverty, and desire, all evil counsellors, now influence him. He has no one to help him; he has only his 'clergie,' which is extensive, if superficial, and we find him in London, trying to live by means of it, of 'that labour that ich lerned best.'"

That is, he lives on what he can pick up from the charitable, repaying them by singing masses for their souls and in similar ways. He condemns such ways, to be sure, just as he does not approve of bondsmen's sons' becoming clerks, but M. Jusserand maintains that his thus violating in his own practice two of his main precepts is quite in accordance with his character. *Deteriora sequor.* He was afflicted with a disease of the will such as those studied by Ribot. *Diboulie, aboulie*—these explain in Langland "the ebb and flow of contrary desires, his being successively drawn to the world and to God, and his sudden conversions."

It is impossible in the space at our command to do justice to the brilliancy of M. Jusserand's argument. We must rest content with a cautionary remark or two. As to the name—whether Langland or Langley—that is of slight moment. It is alleged that "tradition" is in favor of Langland. Prof. Skeat yields reluctantly to this tradition, feeling almost convinced by Pearson's arguments for Langley. M. Jusserand, not to put too fine a point upon it, does not state Pearson's case, which is very strong, with any degree of fairness, and he plays fast and loose with the "tradition." One would hardly guess, from his treatment of the subject, that the most important evidence

for this "tradition" is the fifteenth-century note in the Dublin MS.—a note which also contains the statement that William's father was a franklin or gentleman (*generosus*) named Stacy de Rokyle, who held of Lord Spenser in Oxfordshire. If this note is to be accepted as tradition in favor of the name Langland, why should it not be accepted in other matters as to which M. Jusserand rejects its trustworthiness? The note in the Ashburnham MS. to the effect that "Robert or William Langland made Piers Ploughman," shows by its vacillation that the writer did not know what he was talking about, for the poet tells us over and over again that his name was Will. It is to be hoped that Bale (who also absurdly calls the poet Robert) and Crowley will not be accepted as giving *traditional* evidence. Yet Bale it is who is the earliest authority for Cleobury Mortimer as Langland's birthplace, and M. Jusserand calls this tradition. The fact remains that Pearson's reasoning, based on the bulk of the information furnished us by the Dublin note, alone accounts for all the facts. To assert that this reasoning is opposed to "tradition" is surely to play fast and loose with words and logic.

M. Jusserand thinks the language of Holy Church to William is reconcilable only with the supposition that he was born a serf and was emancipated by taking orders. But this is a gross misreading, as Prof. Skeat long ago pointed out. The passage clearly refers to the reception of the child by Holy Church at baptism—a rite which sets him free from hereditary bondage to sin; the *borwes* (sureties) are the sponsors. No other interpretation is possible unless one has a theory to maintain. Further, William's words in reply to Reson in passus vi. (C text), if read with unprejudiced attention to the context, make it impossible to believe that he was born a bondman. The friends there referred to appear to be kinsmen or family friends, rather than rich patrons who enable a bright young serf to evade the law and go to the University. The same passage gives satisfactory evidence that William was not ashamed of living by means of *pater*, *placebo*, and *dirige*, remaining in that vo cation to which he had been called. "Prayers of a perfect man and discreet penance are the labor best pleasing to God." His denunciation of parsons who run to London to become chantry-priests, "singing for simony, for silver is sweet," is in no wise inconsistent with his own practice. He had no benefice; he left no "sheep encumbered in the mire." In short, we are convinced that M. Jusserand's account of William's station and of the "false position" in which the poet found himself is utterly mistaken, and that his theories about our dreamer's character are therefore in several particulars unsound.

In the chapters on Langland's view of the World and the Church and on his "Art and Aim," M. Jusserand is at his best. There is an abundance of matter set forth with masterly powers of exposition and with much brilliancy of portraiture. The scholar will here find a good deal that is to his purpose, and the reader for pleasure will be fascinated and instructed. The chapter on Langland's "Place in Mystic Literature" is equally brilliant and interesting, but not so sound. The parallel between Langland and Blake is almost absurd.

Though intended for the general reader, M. Jusserand's book contains many notes and observations of interest to the specialist. Such are the suggestions as to the wars "between two Christian Kings" (p. 49), the jubilee of Edward III. (p. 52), the date of the C text (p. 57), the "poor priests" (p. 127). But his accuracy is not always unimpeachable. He bases an assertion that Chaucer "found the rules of rhyme difficult" on a remark in the "Complaint of Venus," though that remark applies in reality only to a specially complicated rhyme-system which he is reproducing in that particular poem. He also declares that Chaucer "sneered at alliteration," quoting in evidence the Parson's "rim, ram, ruf," but suppressing the next line in which the same speaker avows a similar scorn of rhyme. His treatment of the metre of 'Piers Plowman' is far from satisfactory. But these defects and more than these we can well pardon in view of the pleasure and profit we have derived from the work as a whole. It is to be hoped that M. Jusserand will continue his series of monographs.

---

*B. F. Stevens's Facsimiles of Manuscripts in European Archives relating to America, 1773-1783.* Vol. XX., Nos. 1762-1813. December, 1893. London: B. F. Stevens.

DECEMBER, 1777, was a short month, but not a merry one, for the three anxious political forces centred in Paris. The last of the fifty-one papers of vol. xx. of these facsimiles, dated on the 31st, from Stormont to Weymouth, leaves matters really as unsettled as do the memoranda, with which the volume opens, jotted down by Vergennes on the 6th of the month, and signed "approuvé" by the King, who expresses his willingness to establish a close understanding with the Americans, but refuses to recognize their independence or to conclude anything with them unless conjointly with the Spanish King; he furthermore enjoins the Deputies "to confide only in the President of Congress, while pointing out to him the necessity and desirability of inviolable secrecy." By this time Stormont is so close to the limit of any service which he may possibly render his Government, that his despatches begin to cease to have a vital interest, though he maintains to the last the indomitable persistency of his race and the personal courage of his class.

We turn, then, towards the Count de Vergennes and his strenuous attempts to induce the Spanish Court to see matters in exactly the same light in which he himself views them. From the first, he carries with him, or seems to, the convictions of the Count d'Aranda; but, in attempting to force into speedier action the Count de Florida Blanca, through the medium of the Count de Montmorin, who succeeded the Marquis d'Ossun at the Court of Spain, he is baffled by the superb dignity of the Spanish statesman, who does not recognize haste as suited to the exigencies of diplomacy or of war itself. In No. 1767, Aranda reveals an ingenious plot to dispose of Mr. Arthur Lee, whom Vergennes calls "that Deputy, who is very troublesome, and English to the marrow of his bones," and whom Aranda has told that he "could not comply with his desires, by order of my Court, which did not think him [Lee] necessary at Madrid, as everything was to be transacted at Paris, and for other reasons known to him since his first journey." The plan was the simple one of causing Mr. Lee to go as far as the frontier under the pretext of there being able to cross over into Spain when the Court of Madrid should give its consent! The contention of Vergennes is fully outlined in No. 1769, wherein he says: "The Power which first recognizes the independence of the Americans will be the one to gather all the fruits of this war"; and later: "Whatever course is taken, we shall have difficulty in avoiding war with England. It is not what we have done in favor of America which hurts her most grievously; it is the reëstablishment of the navy of the two crowns." He constantly shows his distrust of the consanguinity of the English and American race, and seeks to impress Spain (No. 1775) with the fact that her possessions on the mainland are more tempting to England than are the French islands. Without assurances from the Americans as to the expectations to which the two Crowns have a right to look, he hints that Florida might be lost in any event, although he admits that the Americans "are still too young to have ambitious views about opening up an interloping trade for themselves." Then follow (Nos. 1780, 1786) the rumors, derived through Deane, that the English Ministry is seeking to treat with the Deputies, through the medium of an "unknown," who is, of course, no other than Paul Wentworth.

On the 23d (No. 1790) Florida Blanca informs Montmorin that the Spanish King has decided to give abundant aid in money on condition of absolute secrecy, to offer protection (provided the colonists conduct themselves with fidelity and caution), and to watch attentively affairs in London. No. 1792 covers a heated interview between Florida Blanca and Montmorin, in the course of which the former asserts that the Deputies are trying to compromise Spain and France with England, but, growing calmer, admits that the Spanish King has a repugnance to treating with the Americans, and says it is "not easy to change the mind of a King sixty-two years of age, whose head is filled with Don Quixotism." The real cause of Spain's delay is now recognized to be the necessity of waiting for the return of the Mexican fleet, without whose safety in port it would be dangerous to excite England; the colonists, however, are promised 15,000,000 livres at the end of six months. The communication of Vergennes to Montmorin on December 27 (No. 1805) leaves the Spanish negotiation pending, though Vergennes earnestly urges that hesitation may "allow to escape the only opportunity which may perhaps happen for many centuries for putting England in its true place"; and that this war of necessity is "the most fortunate opportunity which Providence ever offered to the House of Bourbon."

Meanwhile Paris is alive with rumors that a treaty is really concluded between France and America, and that the English ministry is seeking peace on any terms short of conceding the complete independence of America. Stormont, always a ready listener to the gossip of spies, is at last driven to say to Vergennes (No. 1796): "If one-half of the news of Paris is true, it seems to me very doubtful whether I shall have an opportunity of wishing your Excellency a happy New Year; vous me permettrez donc de vous souhaiter la bonne année d'avance." All this because he hears that "on Sunday night a Resolution was taken in Council to assist the Rebels openly, and that a Treaty with them as an independent State was agreed upon, and on the point of being concluded and signed." To this Vergennes replies "that He had been at both Councils, and could assure me upon his Honour, that no Mention had been made of North America, nor of anything relative to it."

While Stormont is plied with information, principally through Paul Wentworth, of whom a rather cold vindication is offered through compulsion (No. 1812) by a Monsieur Favier, Beaumarchais, whose mind "wanders on shore-

less ocean" (No. 1773) by reason of Lee's malicious lunacies, is pouring into the ear of the French minister much information relative to English efforts to approach the Deputies. No. 1778 is a sensational account of the tracking by a French spy of a mysterious Englishman to Deane's house, and thence, by "numberless détours," to the Hôtel du Bain Royal in the Rue de Richelieu. Beaumarchais holds this person to be Mr. Smith, Lord Germain's secretary, but he learns later (No. 1781) that it is "Mr. Wintweth," and that he "feeds at two mangers," meaning that he, Wentworth, was on good terms with both Ministry and Opposition. Then Beaumarchais ejaculates despairingly, "I say, like M. D'Aranda, *God is a Bourbon, it is only the Bourbons who will not be Bourbons.*"

Of surpassing value and interest is No. 1787, written by a still unknown person to Dr. Bancroft. Many attempts have been made to identify the handwriting. Mr. Stevens, who reproduces the very indistinct seal, as a possible clue, remarks that "the last few words, signature, address, and one or two words on the second page of Facsimile 1756 are in the same hand." This letter, which it is a pity not to quote in full, is an open request for "some general intimation concerning the Terms which are likely to satisfy the Congress and People of America"; these terms must, however, stop "a little short of absolute Independency." The letter is written "by desire of a Person of high rank," and the writer closes by saying that "the Subject on which I write is of so delicate a nature, that you will excuse the Omission of my name; as you will readily know it by the Hand writing." It would be now a pleasure to share the knowledge once held by Dr. Edward Bancroft in this matter.

---

*Diary of a Journey across Tibet.* By Capt. Hamilton Bower. Macmillan. 1894.

In his preface Capt. Bower modestly calls his book "a plain, unvarnished diary," without any "claim to literary merit or style," directed chiefly "to those interested in geographical research, and to those who may be contemplating travel in the same or similar regions." We only wish there were more diaries like this one. It has a freshness and simple directness which make it very pleasant reading in spite of occasional slips in grammar; and while all we are told is worth the telling, there is nothing that need fatigue the unlearned reader. We are carried along from one scene or adventure to another without losing interest, and we catch many vivid glimpses of men and things. The author also shows a keen sense of humor with a decided gift for expressing it. Indeed, he speaks of what he underwent and accomplished in such a plain, every-day manner that we are in danger of forgetting that his journey was quite out of the common run, and puts him in the front rank of living explorers.

In company with Surgeon-Capt. W. G. Thorold, starting from Kashmir, he crossed the whole length of the Chang or great Tibetan plateau. Near Lhasa, the sacred city which no living European has reached, he was compelled, after long discussion with the jealous authorities, to retrace his steps for a short distance and then continue by a route further to the north, until finally he came out on the Yang-tse-Kiang, which he descended to the sea. From June to November the average altitude of the ground where the party camped was over 16,000 ft. and much of the region traversed had never before been visited. On one occasion, deserted by their guides, they wandered for days, lost among the high mountains, in constant peril of lacking food or water. In more inhabited tracts they fared little better. One of the main difficulties with which the leader of the expedition had to contend was the character of the natives he encountered. Most of them were hostile, all entirely untrustworthy. Although he met with a few intelligent men among the highest class, the picture he gives us of the Tibetans in general is far from flattering:

"They are cowardly, faithless, and immoral; to those they are afraid of they are servile, to those they are not afraid of, insolent."

"It is almost impossible to get the correct names of places or lakes in Tibet, as every Tibetan lies on every occasion on which he does not see a good valid reason for telling the truth. Sometimes I have asked half-a-dozen men separately the name of a lake and received half-a-dozen different answers."

"It is a long time before one thoroughly understands what a mistake it is ever to be polite, or assume any affectation of friendliness, with Tibetans or Chinese. Even after being taught by experience the folly of it, I have unconsciously often treated them with courtesy and consideration, only to find in return that, while possibly showing politeness outwardly, they would lay themselves out to covertly degrade me in the eyes of the people by insults so far-fetched as often to be quite unperceived at the time, and would invariably manage to shuffle out of any compact. By taking a high tone, civility and as much honesty as their natures are capable of are insured."

And again:

"Poisoning is very prevalent. . . . If one offers a man tea, he generally refuses unless some one first drinks some in his presence; and when offering to eat or drink, a Tibetan invariably ostentatiously takes some in order to show there is nothing to be afraid of."

The government, as is well known, is a theocracy. In theory the Talai Lama, or Deva Zhung (happiness centre), is a *pape-roi;* in practice he is poisoned off before he comes of age. The lamas or monks, some half a million in number, are supported by the rest of the people, whom "they rule with a rod of iron."

"In no country is religion so much *en évidence:* every man has a praying wheel in his hand, which he continually turns, even when on horseback; piles of stones engraved with mystical sentences are met with; flags bearing the same mystical sentences flutter in the wind; and in the very hills and rocks they are inscribed. But all this outward show means nothing but a gross superstition; in no way do the people regard their religion as being a rule of life inculcating virtue and morality; all they think is that, by observing certain rules, benefit—but they know not what benefit—is obtained; and, by neglecting them, calamities—but they know not what calamities—would ensue."

It is perhaps doubtful whether Lamaism can be classed as Buddhism at all. The population (some 8,000,000, of whom perhaps half are in so-called Chinese Tibet) is kept by the custom of polyandry from outgrowing the scanty means of subsistence in this immense region.

The relations of Tibet and China, which are peculiar, may some day be of importance in the complicated game of Asiatic politics. According to the author, the *Amban*, or Chinese Resident, at Lhasa has no power whatever, and the Chinese are "a stalking-horse" to use against the outside world. Even further west, in regions nominally under their direct jurisdiction, the *Amban* is little more than a figurehead. So much for the present, but the author does not refer to the meaning of such a relation for the future. However shadowy Chinese suzerainty may now be, it probably has substance enough to keep off Great Britain and Russia; and as the military power of the lamas is *nil*, we may confidently expect that the Imperial Government will slowly but surely tighten its grasp, as it has in the last few years in other outlying provinces and dependencies. Kashgar is as far away as Lhasa from Pekin, and its inhabitants were far more warlike, but eastern Turkestan has been thoroughly subdued, and what is left of the population has been taught a lesson it will not soon forget. Already the peaceful invasion of Tibet has begun. The Chinese are coming in increasing numbers, pushing further and further west; and, as elsewhere, the natives, the weaker race, cannot in the end compete with them. Whether the country will be better off as a province of the Celestial Empire than under the present régime may perhaps be doubted.

"The identical people under the rule of China differ enormously from those under Lhasa. The Lhasa Government may not be a strong one, but, compared to the Chinese, it seems so; thieves, instead of being the rule, are the exception, and the people can certainly be restrained and kept in order by those in authority over them. A good deal of it may be owing to the fact that the Tibetan of high rank is immeasurably superior to the Chinese mandarin—in intellect his equal, in strength of character his superior; there is a more manly, healthy tone about him than about the time-serving literati of the Celestial Empire."

We doubt if the writer's experience was sufficient to authorize him to make such sweeping statements as some of the above. Still, we do not wish to close with a criticism, but rather to repeat that Capt. Bower, after making a remarkable journey, also deserves credit for the excellent and very readable account he has given us of it.

---

*Modern Mystics and Modern Magic.* By Arthur Lillie. Scribners. 1894.

This book affords matter for curious reflections. Its purpose, if it has any definite purpose, is to draw attention to the mediumship of the Rev. W. Stainton Moses, and to urge the claims of the spiritualism that was in fashion twenty years ago. This Rev. Stainton Moses, a man of defective health—though whether epileptic or subject to insanity we are not told—was a country curate, and an undermaster in an unimportant school. He is said to have been one of the half-dozen greatest mediums, and the only one of the half-dozen whose mediumship was adverse to his worldly interests. That he must have seen it to be so, in advance of committing himself to it, is not made clear; but we are disposed to think that he did.

Spiritualism may be considered under two aspects: that of the phenomena or miracles (as we may, without prejudice, conveniently term them), and that of the character of its doctrines. Modern psychology has made a beginning towards an explanation of the former, still quite defective, and leaving their genuineness still in doubt. But the materialistic, and generally grovelling, character of the upshot, assuming the manifestations to be veritable, appears unmistakable in regard to the revelations of Stainton Moses. The clergyman seems to have written a book of his personal objections to the theological teachings of his spirit-guide, with the replies, which brought him to a state of belief that deprived him of his curacy and ultimately caused his death. Of these teachings, we can at best say that they might have been more flat. Many sects are founded upon less elevated ideas. But they are, on the whole, pretty commonplace, and not at all extraordinary. They show no wonderful insight, no deep spirituality; they seem rather to skim the surface of religion.

It is not an unparalleled occurrence to meet

an Anglican clergyman, only slightly acquainted with the sort of thought which has made the modern world, whose ideas of the divine order seem rather wooden and lifeless. That sort of man, it would seem, was the Rev. Stainton Moses. He took a part, at first, in the work of the Psychical Research Society; but his colleagues (though the scientific world has thought them rather credulous, and some facts have gone to bear out that estimate) found him altogether too incautious and hasty, while their ways of thinking were to him incomprehensible. The logical maxim called Ockham's razor was held by him, as it is by Mr. Lillie, in utter scorn. The latter declares substantially that if this principle be adopted, the conclusion must be Büchnerism. Namely, he remarks (p. 132) concerning Mr. Hodgson's saying, "I was compelled to assume, in the first instance, that Mrs. Piper was fraudulent," that "a man who starts on the investigation of psychical matters in that spirit" will come out with the doctrine (p. 135) "labelled 'Büchner.'" Surely, this is a very large concession. Were it a proper one, it would seem to settle the whole dispute. But it is not a proper concession. Büchnerism consists in a materialistic conception of the universe, due to a hasty and superficial generalization from some of the most striking results of physical science. The Psychical Research Societies cannot be accused of this. On the contrary, precisely what they are engaged in is the inquiry whether there are not phenomena which cannot possibly be brought under such a formula, They may not have been very wise to spend their lives in researches which, with the means now at command, did not promise decisive results. There is such a thing as economy in scientific investigations; and it was perhaps a rash undertaking for those men to stake their lives on such an exploration. Nor have they shown any fine genius—any Faradayesque power—of bridging the chasm between the known and the unknown. But they have shown themselves to be fairly candid and, under human limitations, rational inquirers. Certainly, if they have not been in haste to announce positive results which would have redeemed their reputation for good judgment in embarking in their enterprise, this reserve should redound to their credit. Sober-minded judges are inclined to think they look too favorably upon the slender promises of such results; not too sceptically.

The opinions of the prudent in regard to another world are very unsettled in our age; inclinations towards opinions are very divergent; but no doubt the resultant of them all is a vague faith that the creed of Büchner will not answer the conditions of the problem. Twenty years ago sensible people dwelt with emphasis on the vast amount of cheating and mendacity connected with marvels of all kinds. But during the interval many things have been brought to light to increase our respect for human honesty, until now it is likely the pendulum is on the other side of the equilibrium of justice. Most of us to-day are somewhat disposed to admit that, for example, Swedenborg had a miraculous knowledge of the fire in Stockholm, trivial as the miracle was, and in spite of the manifest falsification of his more important prophecies. Then, too, twenty or thirty years ago, thinkers dealt largely in necessity. Such and such a thing *must* be the case; such and such other thing *cannot* be. But since the axioms of geometry were exploded, as anything more than probable approximations, we fight shy of asserting that anything in nature is exactly accordant with our inductions. The question is no longer whether disembodied spirits *can* move matter, but whether the collective observations of experience are favorable to their frequently playing the particular sort of tricks which they are supposed by spiritualists to play. So in regard to miracles, we no longer ask whether the sun *could* go back on the dial of Ahaz, but whether the evidence is sufficient that it really did so.

Mr. Stainton Moses instituted many intended crucial tests of the manifestations. These are all, or nearly all, of one description. Namely, with or without the suggestion of a "spirit," he asks for information he is not aware of possessing, and under the supposed guidance of the spirit he writes down that information. Thus, he asks the spirit to write the first words of the last paragraph on page 98 of a book he has forgotten all about; and it is done. A modern psychologist would see in such phenomena indications of two or more states of consciousness capable of producing suggestions the one in the other. Perfumes played a great part in Moses's manifestations. Sweet odors, often of strange kinds, were usually perceived when something extraordinary was about to occur. As there seems to be no rational connection between the perfumes and the significance of the revelations, their occurrence naturally suggests some derangement of the brain.

Mr. Lillie practically admits the explanation by multiple consciousness, for his only reply to it is that all multiple consciousness is obsession by spirits. This is granting that the phenomena of Stainton Moses are of the same class as those of multiple consciousness; but Mr. Lillie fails to show how it is necessary to invoke the hypothesis of spirit influence to explain either the one or the other.

---

*Edward Livingston Youmans*, Interpreter of Science for the People: A Sketch of his Life, with selections from his published writings, and extracts from his correspondence with Spencer, Huxley, Tyndall, and others. By John Fiske. D. Appleton & Co. 1894.

It is often remarked that the life of a man of science, how great soever his works may be, can offer but little of interest to the general reader. When the lives and letters of such men appear, we are accustomed to regard them as designed mainly for the edification of friends and relatives, and as performing for posterity much the same functions as an extended inscription on a tombstone. But one soon finds, on looking through Mr. Fiske's book, that an exceptional interest attaches to the history which it embodies. The characterization of Youmans as interpreter of science for the people may perhaps do the book a little injustice in giving the impression that his most important work took this direction. It was not as an interpreter of chemistry, or even of the doctrine of evolution, to the people, that Mr. Youmans most deserves to be remembered, but rather as the agent through which the doctrines and works of Spencer were first brought prominently to the notice of the American people. He may even have been a not inconsiderable factor in bringing Spencer to notice among his own countrymen. There is nothing uncommon in finding a philosopher without honor at home until it is reflected upon him from abroad. This is frequently the case with Americans—so frequently, in fact, that one never expects such a reflection to be thrown from America upon any European country. But in the present case it is certain that thirty years ago Spencer was much more widely read and highly appreciated in America than in England, and there is nothing unreasonable in supposing that American appreciation was an important factor in drawing English attention to his writings. That Youmans was the leading agent in this result was well known, but the full extent of his activity is now brought to view for the first time.

In his earlier chapters one cannot but admire the way in which Mr. Fiske makes a rather commonplace story both pleasing and instructive. A rural community in which social, political, and philosophic questions were freely discussed by young men and old, each determined to reach his own conclusions for himself, seems a very familiar sort of thing to us; but will it seem so to our children? Common enough to this day is the doubting and rationalistic husband abdicating his reason to a religious wife who does not use her reason at all. We have often read and heard of the youthful seeker after knowledge who reads all the good books he can get hold of, busies himself in demonstrating the laws of mechanics by windmills and waterwheels, and scares his mother with chemical experiments. But we much fear that as the graded school and the iron curriculum extend their influence over the land, this bright boy will disappear as the buffalo has disappeared before the advance of a semi-barbaric civilization. The country teacher caring little for rote learning, aiming rather at the development of the thinking faculty and the right guidance of spontaneity, is often described as one of the actors in the millennium, who is to take the leading part in showing the bright boy how to use his faculties. We are glad to learn that he actually existed sixty years ago in a New York village in the person of Jeremiah Goodrich, alias "Uncle Good." It is only just to remark that a most exceptional feature of the story is the almost total blindness of Youmans from the age of seventeen till twenty-three, and even longer, as recovery was very slow.

In the later chapters Mr. Fiske quite judiciously lets his subject tell the greater part of his story, through his letters and correspondence. No one who knew him only from his very grave articles in the *Popular Science Monthly* would ever have suspected him of being so lively and humorous a correspondent. In the letters the entire story of the arrangements through which Spencer's works were brought out in this country is told very fully. The story is an important and readable contribution to the history of an enterprise which has had an important bearing on thought in our times.

We lay the book down with a feeling that the author has put forth one of his best efforts in depicting a life which deserved more fame than it got, and offers a more instructive example to youth and manhood than the history of many more prominent actors in the world's drama.

---

*Dante Rossetti and the Pre-Raphaelite Movement.* By Esther Wood. Charles Scribner's Sons.

*Dante Gabriel Rossetti.* By F. G. Stephens. London: Seeley & Co.; New York: Macmillan. [Portfolio Monographs on Artistic Subjects.]

The simultaneous appearance of two books on Rossetti, following the earlier and timely publications, shows an interest in the life and work of that unique artist which only those who knew him personally can thoroughly understand, as only a wide knowledge of art can

enable one to estimate their value. But a just comparative estimate of Rossetti as painter or poet is hardly possible yet, and no more can the truth of his life be told in the lifetime of persons now living, and who were in too close relation to him to be able to speak freely of him. The personal fascination of the man was such that those who lived under it long would never be able to judge his work coolly, while its peculiarities, defects, and qualities are such that time must be given for a broad estimate of its rank as art. To the material for forming this true estimate the book of Mrs. Wood furnishes no additional material; it is all hearsay; its opinions have all the inconsistency of the overestimate of the contemporary, without any apparent knowledge of the individual; it is at once inflated, exaggerated, and very insufficient, starts from the purely sentimental side of art, and rings the changes on mysticism and symbolism, poetry and painting, till one lays down the book with a wonder as to what kind of world the author has lived in. We alternate between dogmatism of the emptiest because founded on no knowledge of art, and declamation which is but the vagary of language.

The generalizations of the book may be fairly judged by a single example which we quote entire, the subject being the coming on the scene of the school (?) called pre-Raphaelite:

"Then the great wave of rebellion, surging through the life of Europe, swept into the deep backwaters of imaginative and creative thought. Men born into the storm and stress of revolution, and confronted with the great practical problems of practical life, were thrown once more upon the spiritual world. And as the outward struggle spent itself, its full significance weighed more upon the peoples. The deep charm of the contemplative, the reflective, the critical, fell once more upon the European mind."

One hears in this a murmur of Ruskin and Carlyle, about as he does the roar of the sea in a conch-shell. Next this, describing the "neo-romantic revival . . . which appeared soon after the year 1845 on English exhibition walls":

"And to do this it became necessary to set out, as it were, the terms on which life is lived; to deal not merely with the beauty which man loves and the joy which he desires, but also with the stern conditions of their attainment. The struggle between the present evil and the recognized good, the conflict of the soul with earthly bonds, Love baffled in dire cross-currents of fate and duty, or wasted and despoiled in sin, Faith shaken by the storms of circumstance, Hope bowed down before the closing doors of death; and, on the other hand, the glory of consummated joys (though never without the under-thought of their transiency) or the strength of human fidelity and endurance—these are the themes of the second renaissance."

After a rambling medley on the whole school, of which the only new matter is certain anecdotes furnished by a fellow-student at the R. A. school, Mr. J. A. Vintner, and which finishes with the death of Dante at Birchington, we have a rehash nearly as long, which reminds one of Agassiz's first lecture, in which, having told the audience all he knew in twenty minutes, to make out his hour he recapitulated it, and succeeded in occupying only a half-hour, and was obliged to stop for want of more to say.

Mr. Stephens's monograph is of a different type; and if posterity should find it necessary to give Rossetti his position among the immortals, his biographer will have furnished at least safe material to be guided by. The author knew Rossetti intimately from the beginning of his career, and, if affected in his judgments by the fascination of the circle, at least in his comparative estimates he is sound, as in his art opinions he is informed by a large critical experience. His judgments are toned by a strong personal attachment, and his facts are mainly accurate; but there are certain passages of Rossetti's life about which both he and Mrs. Wood are mistaken, and of which Stephens does not, perhaps, care to tell the truth. We think that Stephens, like all the admirers of Rossetti, overestimates the value of his technique, which was, as compared with his ideal of art, juvenile; he always lamented that he had not in the beginning been taught to paint, and he blundered all his life through experiments in methods of which he could not hope to see the success. He was essentially a subjective painter, and never profited much by direct study from Nature, unlike Millais and Holman Hunt, who never were able to leave her. There was nothing in common between him and them, if it be not originality. The samples of illustration in both the books under review show that Rossetti, unlike Millais, never learned to draw accurately, and in his later life his drawing is often curious in its distortion; but his sense of color was one of the most remarkable of all time, and makes us all the more regret that he had not been educated in a true and solid school which would have given permanence to his coloring and developed still further its motive. He was to the last a student, trying, often blundering, rarely satisfying himself. All the biographies of Rossetti mistake and misstate the circumstances of his final breaking down in health, which began, long before they noticed it, in over-work at night, and was already a grave menace in 1868. Most of the later works of Rossetti in which the female head was rendered, were taken from Mrs. William Morris, who shared the judgment of beauty with Miss Wilding; the two giving him the material for most of his later work. The head which Mr. Stephens gives in his illustration on p. 63 is not, as he says, of Mrs. Stillman, but of Miss Wilding; the "Lady with the gold chain," "Our Lady of Pity," "Pandora," "Proserpine," and many others at the time these were drawn, being portraits of Mrs. Morris.

---

*An Illustrated Dictionary of Medicine, Biology, and Allied Sciences.* . . . Based upon recent scientific literature. By George M. Gould, A.M., M.D. Philadelphia: P. Blakiston, Son & Co. 1894. 4to, pp. 1633.

NOT to compare this dictionary with smaller ones in extensive use, by the same editor, we have confronted it first with the twelfth edition of Hoblyn's 'Dictionary of Terms Used in Medicine and the Collateral Sciences' (London, 1892), a plump duodecimo of 822 pages. Page 562 of the latter embraces *pith* to *placenta*, or ten items in all; while in the same limits there are twenty-one in Gould. Again, p. 672, Hoblyn has fifteen to Gould's sixty-nine. The compounds of *ophthal-* (Dr. Gould's specialty) number eight in the English and one hundred and sixteen in the American work. Hoblyn has no illustrations, while those in Gould are abundant and of great beauty of execution; among them we will single out the group of postures in surgical operations, which is backed by a table explaining the uses of each; the group of bandages, etc. The tables form an admirable feature, and we may particularize that of eponymic diseases, as Addison's disease, Barton's fracture, Bérard's aneurysm, etc., filling thirteen pages; parallel with which is the untabulated list under *Operations*, a perfect columbarium of eminent practitioners. Other remarkable tables are of arteries, bones, foramina, ganglia, muscles, pigments, poisons, stains, tests, and tumors; and lists of bacilli, bacteria, and parasites.

We have applied also the test of the 'Century Dictionary,' choosing the compounds of *hyper-*. This rich vocabulary contains twenty entries not to be found in Gould, and lacks ninety-nine which he has collected. It is fair to say that this difference is not absolute, since the one dictionary sometimes records the noun, the other the adjective, either of which would satisfy the seeker after definitions, and since a large part of Gould's vocabulary is strictly non-English. In the same way, and with the same qualification, the compounds of *cata-* in Dr. Murray's Dictionary yield twenty-one vocables not recorded by Gould, who in turn has forty-three not embraced in the greater work. The conclusion is not to the disparagement of either the Century or the New Dictionary; it is merely that Dr. Gould's volume is a substantial addition to this class of books of reference. A small number of foreign phrases has been admitted—*in extremis* (but not *in articulo mortis*), *in vitro*, etc. We miss the table of abbreviations which Hoblyn gives under Prescriptions.

This is not an historical dictionary. Occasionally dates are annexed to Latin names and to names of authors and inventors. On the other hand, neither under Ether nor under Anæsthetic is there any hint of the vexed question, for this country, of the first employment of ether in surgery. Phrenology is defined in a purely impersonal way, and without date. Spurzheim's Amativeness is let in without citing his authority; Philoprogenitiveness is disregarded; Bump is taken note of, with the remark, "origin uncertain," but this is etymological. Pronunciation is indicated in the simplest manner, except when French is in question, and then we have the old *on(g)* revived to imitate the nasal *en*. There is a moderate attempt to throw the weight of the Dictionary in favor of an improved spelling, while generally exhibiting also the common form. We do not share the editor's preference for the ending -eal over -ial in such adjectives as apophysial. The derivations of words are of most consequence in formations from Latin and Greek, the proof-reading in both these languages being noticeably careful; but pittacal is said to borrow its root from the Latin *pix*. Cross-references are sometimes inadequate. The expectation-table under Life finds no pointer under Expectation; the table of gestation or incubation under Pregnancy is not hinted at under either of its captions, and incubation itself is defined without including the meaning applicable to the table. In this table, by the way, the horse is bracketed with the camel as having a term of thirteen months, whereas eleven is the minimum for both. For Painters' Colic we are referred to Colica, but the description under Colic is much fuller. Pajot's Law has an entry by itself, but is not catalogued under Law, nor is his "method" registered under "Operations and Methods"; so Bowditch Island Ringworm is missing from the list under Ringworm.

These are trifling inaccuracies and inconsistencies in a work whose general trustworthiness is as apparent as its utility.

---

*Society in China.* By Prof. K. Douglas. London: A. D. Innes & Co.

THIS book, by the keeper of the Oriental books and manuscripts in the British Museum and Professor of Chinese at King's College, naturally provokes comparison with another book

on the same general subject. The late Rev. Justus Doolittle's 'Social Life of the Chinese' was published in 1865 and reissued in the American edition in 1876. It dealt with the social institutions, customs, and views of the Chinese, and was written by one who lived constantly among the people, gathering his material and forming his judgments from living beings as well as from written records. It is to-day an excellent source of information Nevertheless, so densely apathetic is the feeling of the Western world towards China that new books seem to be requisite from time to time to excite even a passing interest. Apparently it is necessary that literary bomb-lances be shot frequently at the great mass of indifference in order to arouse it to sympathy or even curiosity. It must be confessed that Prof. Douglas's book is to be classed with those which the admirer of Marjorie Daw hurled at his body-servant Crosby, among projectiles. It has the whiz of a Jingo weapon. Apparently its object is to goad the British authorities to a more stalwart policy in China. From one point of view it is an appendix to the Jingoish Life of Sir Harry Parkes recently reviewed in these columns.

China is governed, both socially and politically, by the literati or mandarins, and for these gentry Prof. Douglas has no good word to say. He considers them the most bigoted wretches on the face of the earth. They are both unsleeping and implacable in their hatred of foreigners, and spend their lives in determined efforts to drive out all aliens from the country. They would build up a new Chinese wall around the whole world of China, and make a society utterly impervious to foreign ideas. They are incredibly conservative, and anything like originality in thought is hooted down as impiety and treason. No body of educated men known in history has ever equalled them in ignorance, bigotry, violence and corruption. It may be that all that Prof. Douglas says of these dictators of Chinese thought and fashion is true, but it seems never to occur to him that possibly the British view of the case has some elements of fallibility in it. "British interests" is no doubt a religion to many men born in England, and yet even the creed of this religion may possibly be in need of revision.

Apart from this criticism, the book is a welcome addition to the shelf of books on China. It is handsomely printed and bound. Its thick paper and good type, with the twenty-two illustrations, some of which are exquisite reproductions of scenery or architecture, make it rank high even among English books. The style is also very agreeable, and the text is divided into numerous short chapters, for the reader's comfort. Naturally the opening chapter treats of the Emperor and court. To the great family of the Chinese the Chief Magistrate of the Empire is not only the Son of Heaven but also the Buddha of the present day. To find out about the daily life of one so secluded from public view is an enterprise, even for one living in Peking, that would tax the ingenuity of a keyhole reporter for an American newspaper. The author, living in London, has to rely upon that wonderfully frank newspaper periodical, the *Peking Gazette*, and upon the plays and novels of the people, for sketches of his monotonous and dreary existence. After describing the government, the penal code, and the administration of the laws, the author outlines and details Chinese society, beginning with the village communities. He treats of the literati and farmers, and then of the mechanics and merchants—for China, with all her wealth and the antiquity of her commerce, rates the merchant below the farmer and even the farm laborer. The competitive examinations receive due treatment, and then follow descriptions of marriage, family life, and funeral rites. To Prof. Douglas, China is the land of shams. There is no country in the world where practice and profession are more widely separated. The Empire is preëminently one of make-believe. There is no more prolix or tiresome preaching of virtue anywhere on earth, and yet it is doubtful whether such systematic hypocrisy is elsewhere so general.

On some questions which students of Chinese life consider "vexed" or "burning," the author speaks with commendable modesty. He believes, because the proofs are too strong to believe anything else, that infanticide is frequently practised, but it is difficult to pronounce accurately upon the prevalence of the custom. Occasionally some foreigner may stumble upon out-of-the-way places which are covered with the unburied remains of infants, and notices may sometimes be seen at the sides of pools to the effect that "Girls may not be drowned here." The province of Fuhkien is most infamous for its destruction of girl-babies, while at Peking the custom cannot be said to exist at all. Other interesting chapters relate to food and dress, gardens and travel, coins and art. The chapter on the religions of China is curt and scrappy. It is in his treatment of England's commercial relations, the war of 1860, the outrages on missionaries, the audience question, and foreign trade in China, that the author waxes eloquent and becomes most vigorous in the handling of his pen. The book lacks an index, of which it is worthy.

---

*By Moorland and Sea.* By Francis A. Knight. Boston: Roberts Brothers.

*Wayside Sketches.* By Eben J. Loomis. Boston: Roberts Brothers.

If certain expectations are ruled out of court in regard to these two volumes, almost everything that remains may be said in their praise. They may furthermore be praised in nearly identical terms and paragraphs, for, notwithstanding the transatlantic origin and scenery of one of them, they are alike in their qualities and their points of view. Both suggest, and incidentally confess to, a non-professional paternity. Neither is trimmed and pruned and clipped precisely, after the fashion of the writer who practises literature as an art, but in the more desultory mode of those who pursue it as a relaxation. The reader in quest of the artistic reticence and fastidious avoidance of commonplace that characterize such portrayers of rural England as "Q." and Hardy, may be warned off at once, while the mood that can be suited only by the delicate and distinguished humor of such another open-air saunterer as the author of 'Pagan Papers' must search elsewhere than here for its complementary color in print. But if themes that are at once refreshing and refining, sanely and cheerfully treated, are to any one's taste, he can be confidently promised its gratification at the hands of both our writers.

Mr. Knight's wanderings are wide and various. He describes from the deck of a yacht that stormy portion of the British coast which most travellers, by reason of their physical infirmity, see either not at all or in very incomplete glimpses. The Hebrides have lost nothing in wildness since Dr. Johnson made his famous "journey" thither. It is even possible that they have gained in human isolation through the displacement of crofters in favor of deer forests, more highly valued by modern owners. An undiminished population of birds, whose multifarious names could be remembered only by a naturalist, still inhabit the bleak cliffs, and lend variety and animation to Mr. Knight's descriptions. His moorlands are partly those of the north, and are in part those altogether lovely and desirable wastes of heather and gorse across which the North Devon coach ruthlessly speeds the passenger, in one and the same breath berating himself for his hurry and thanking the fortune that has brought him to an outside place on even this unsympathizing vehicle.

Ordinarily Mr. Knight is possessed of the wisdom that tarries in journeying. But his trip from Paddington to Plymouth, on the engine of a Great Western express, forms the topic of one of his most agreeable papers. At Bristol, Chatterton is of course brought to mind, but, strangely enough, Keats has not been remembered at Dawlish, notwithstanding the annoying inveteracy with which poetical quotations at every turn break the swing of the prose.

Their very limited circumference is, on the contrary, the distinguishing feature of Mr. Loomis's holiday outings. Save for a visit to the ruins of a family homestead in New England, they are confined to a comparatively small radius from Washington. But it is Mr. Loomis's cue to discover the largeness that the large mind can always find in circumscribed space, and he is eminently successful in his attempt. In his walks about the suburbs of the city of his adoption as Congressman, he reads a lesson to neighbors of the type of the Londoner who has never gone to see Westminster Abbey. He also is an intimate friend of the feathered tribes, and opens up an acquaintance with some of them for which any one may feel himself socially richer. Less happy when he allows his imagination too fantastic excursions into the boundaries of allegory, he nevertheless presents on every page the interesting individuality of a person who runs no risk of the boredom which is the bane and retribution of unoccupied minds.

Each of these volumes equally with the other inspires the wish that it might vie in popularity with the light novel, sole literary pabulum of such minds. But through the same flaw of constitution that prefers finery to cleanliness, or pastry to bread, there is little hope that, this side of a millennium, the careless reader will find his mental pastime in books which, like these, leave the mind fuller and observation of nature sharpened. Easy to read as fiction, though entirely unsensational, they will leave with the reader a comfortable impression of the widespread substantiality of human intelligence, very like that which comes from fresh contact with healthy solidity of character, where exceptional qualities are neither strained after nor affected.

---

*The Binding of Books:* An Essay in the History of Gold-tooled Bindings. By Herbert D. Horne. London: Kegan Paul, Trench, Trübner & Co.; New York: Charles Scribner's Sons.

No volume in the series of "Books about Books" which Mr. A. W. Pollard is skilfully editing has been more harmoniously in accord with the general idea of the series than this on bookbinding. Mr. Horne has started with the belief that the "Books about Books" were intended for book-lovers at large, for those who like books as books without any special knowledge of the several departments of bibliophilistic lore. He has therefore begun at

the beginning, and in his first chapter, "The Craft of Bookbinding," gives an account of the mechanical processes of bookbinding, an understanding of which is a condition precedent to a rational appreciation of the masterpieces of the art. He describes the successive steps of "forwarding" and "finishing" so clearly that the lay reader can follow without difficulty. Although this information can of course be had in technical treatises, like Mr. Zaehnsdorf's (or Mr. William Matthews's Grolier Club lecture), yet Mr. Horne is the first writer of an historic sketch of bookbinding who has seen the necessity of prefixing such an explanation; and that he should have done so is strong evidence of his fitness for the difficult task he has undertaken.

In three successive chapters, he next presents us with brief outline histories of the art of binding in Italy, in France, and in England. His knowledge is wide, and his understanding of the principles of the art thorough; and it is a pleasure to follow his clear account of the development of gold-tooling in Italy and its transference to France. While claiming a high place for the early Italian binders, he is almost ready to admit the truth of M. Thoinan's assertion that bookbinding is really a French art. Of English binding he speaks with commendable disinterestedness. He rates Roger Payne more highly than do the French critics (who ignore all English binders for the most part), but his eulogy is temperate after all.

In the final chapter, in which the author discusses the principles of decoration as applied to books—a subject he approaches with both the bias and the training of an architect—Mr. Horne performs the valuable service of showing that a bookbinder must design with his tools in his mind if not actually in his hand, since the decoration of a book cover is conditioned absolutely by the means for executing it at the binder's disposal; and he exemplifies this by decomposing one of Mr. Cobden-Sanderson's richest and most elaborate book covers, and by printing an impression of each one of the few and simple tools used in its composition. The lover of beautiful bindings probably knows that they are all composed by a host of little tools, but it was well to make this visible to him. Much of the most pretentious of recent German binding fails because the designs are the work of architects who disregard the means of execution.

The dozen illustrations of Mr. Horne's book are well selected; they are apparently photogravures, but neither as well executed nor as well printed as we have been accustomed to find in books of Parisian or New York manufacture. Mr. Horne, it may be noted, displays no knowledge of any American bookbindings or of any American writing about the subject.

BOOKS OF THE WEEK.

Aspects of Modern Study: University Extension Addresses. Macmillan. $1.
Bradshaw, John. An English Anthology from Chaucer to Tennyson. 4th ed. Longmans, Green & Co. $1.50.
Chêlard, Raoul. L'Autriche Contemporaine. Paris: Léon Chailley.
Duruy, Victor. History of Modern Times. Henry Holt & Co. $1.60.
Forster, Francis. Major Joshua: A Novel. Longmans, Green & Co. $1.
Gudeman, Prof. Alfred. Tacitus's Dialogus de Oratoribus. Boston: Ginn & Co.
Hensel, Julius Macrobiotic; or, Our Diseases and Our Remedies. Philadelphia: Boericke & Tafel.
Irvine, Leigh H. Told in Whispers. Crown Publishing Co. 50 cents.
Lewis, L. R. National School Library of Song. No. 2. Boston: Ginn & Co. 60 cents.
Much Ado About Nothing. Love's Labor Lost. [The Temple Shakspere.] London: Dent; New York: Macmillan. Each 45 cents.
Noble, Annette L. Love and Shawl-Straps. Putnams. 50 cents.
Otken, C. H. The Ills of the South. Putnams. $1.50.
Parker, F. W. Talks on Pedagogics New York and Chicago: E. L. Kellogg & Co $1.50.
Roux, Hugues le. Confidences d'Hommes. Paris: Calmann Levy; New York: Charles Eitel.
Ruskin, John. Letters to a College Friend, 1840—1845. London: George Allen; New York: Macmillan. $1.50.
Scott, Sir Walter. Quentin Durward. 2 vols. [International Edition.] Boston: Estes & Lauriat; New York: Bryan, Taylor & Co.

## The Week.

THE commendation of President Cleveland's course during the recent labor troubles by more than one Republican county convention is an evidence that the ancient bitterness of partisanship is steadily giving way. The Republicans of Jefferson County, Mo., endorsed the President "for his patriotic course in using the full power of the Government to at once suppress riot and anarchy." The Republicans of Dallas County, Texas, "endorsed the action of President Cleveland in maintaining public order and upholding national authority during the late disturbance in the city of Chicago." The Burlington *Hawkeye*, one of the most prominent Republican newspapers in Iowa, strongly urged the adoption of a like plank in the platform of its party at the recent State convention. This was a little too much for the sort of politicians who controlled the gathering, but the fact that such advice could be given by a party organ in one State, and that county conventions in two other States have pursued this course, shows to what an extent the Democratic President's course has met the approval of fair-minded Republicans.

---

Ex-Gov. Boies of Iowa is the first public man since Senator Davis to get over stage-fright about Labor and speak out like a man not afraid of shadows. His address before the State Democratic Convention at Des Moines on Thursday is worthy of particular commendation in these days of tongue-tied statesmen. The Republicans of Illinois met in State convention the week before, and though their chief city and the State itself had just barely escaped plunging into universal anarchy, they had not a word to say in condemnation of the criminals who had brought them into such deadly peril, nor in praise of the national executive who, by his prompt and fearless action, had rescued them from it. Gov. Boies did not mince his language, but plainly told the labor agitators that their strike meant simple revolution and anarchy, and was but "the incipient stage of civil war." With equal emphasis did he declare that the "sympathetic strike" must go, or else that the unions that encourage it and engage in it will be destroyed. It will be said that Mr. Boies uses such plainness of speech because he has no further political ambition. But if he had, there could be no surer way of furthering it than such manly affirmations. It is one of the delusions of our small-minded politicians that the people like trimmers and trucklers. But Hosea Biglow spoke for the American people when he said, "By Time, I *du* like a feller that ain't a Feared."

---

The Senate passed on Monday a bill against "alien anarchists." Severe measures are to be taken against them, to prevent their landing in this country, and to provide for their deportation if they are hardened enough to get ashore. Suspected alien anarchists are to be rigidly examined, "by pertinent questions," as to their "antecedents and political opinions," and if any of them confess to having bombs concealed about their persons, they are to be sternly sent back to the land of their nativity. It is well known that anarchists always speak the truth, otherwise it might be hard to make the law effective. We must say, however, that it would be simpler to make all alien anarchists wear a badge or some distinctive dress, so that they might be recognized on sight, and freed from all temptation to perjure themselves under cross-examination. But the law, as it is, will make all good citizens rejoice. France and Germany are having a terrible time passing laws against anarchists. But they have, unfortunately, to deal with their own subjects. If they were as happy as we in having no native anarchists, perhaps they could solve the whole question with a law as beautiful in its simplicity as the one our Senate has passed in a single session.

---

There is a deepening mystery about Senator Smith of New Jersey, and the Society for Psychical Research cannot too soon take hold of him. The phenomena of double consciousness were never more clearly marked. The public first began to suspect that there was a double when the Jersey Senator's speech on the income tax was made. His nearest friends at once saw that something had happened to the man they knew so well. For a time, the private-secretary theory was held, but those who knew the private secretary well were ready to make oath that he couldn't have written the speech either. This was puzzling enough, but what came after was positively stupefying. A man purporting to be Smith of New Jersey appeared before the Senate investigating committee and swore that he had not bought or sold, directly or indirectly, any sugar stock "since the beginning of this session of Congress." But another man, asserting that he was the same Senator, appeared later before the same committee and made oath that he had bought "a thousand shares of Sugar about last January." Which was the impostor Smith or the sleep-walking Smith? Again, on August 2 the real James Smith, jr., or at any rate a man who professed to be he, wrote to some of his Englewood constituents that he would not vote for the Wilson bill because "it would have made it impossible for at least 50 per cent. of the manufactories within the borders of our State to continue or resume operations." So much for the protectionist Smith; but the free-trade Smith took an inning on Monday and asserted that he was in favor of free sugar, raw and refined, and particularly in favor of free coal and iron ore, as the latter "would be a practical benefit to my State."

---

The Senate committee on Territories has reported favorably the House bills for the admission of New Mexico and Arizona as States, and apparently only a pressure of other matters will prevent the passage of the measures. New Mexico is still a half-foreign community, and Arizona has only about 63,000 people all told, but each is to be given as much power in the Senate as New York or Pennsylvania. Their admission will be a gross outrage upon the country, but each party thinks that it stands a chance of getting the two Senators from each of the new commonwealths, and nobody seems ready to make an effective protest.

---

The House of Representatives has succeeded in having the scandalous $1,000,000 item for extirpating the Russian thistle struck out of the appropriation for the Agricultural Department. It has not been so firm in resisting the extravagance of the Senate in the case of the river-and-harbor bill. This appropriation bill notoriously conceals more jobbery than any other, and is, therefore, a peculiar favorite with the Senate. After attempting to increase it a good deal more, this useful and conservative legislative body has finally compromised with the House by accepting an increase of about $2,000,000 over the sum originally fixed. While the total appropriation—about $11,500,000—is not extravagant measured by the standards of former years, the policy of the Senate in neutralizing the attempts of the House of Representatives to lessen the burden of taxation borne by the people is disgraceful. To veto measures that suffer such treatment in the Senate would be a popular course for the President to adopt.

---

The success of the Democratic ticket over the Republican-Populist fusion in

the Alabama election on Monday is cause for rejoicing on the part of all good citizens. Kolb, the candidate of the "combine," is an unscrupulous demagogue, who deserved no support—least of all the endorsement of sound-money men in New England, as Senator Hoar and the members of the Home Market Club profess to be. The most interesting and significant feature of the election is the impetus which it has given to the breaking down of the race line in Southern politics. Both the Democrats and the fusionists have sought the support of the negroes, and this has been done openly and frankly. A large proportion of the colored men voted for Oates, and they did it upon a clear understanding as to the attitude of his party toward their race. This understanding was reached through some interesting correspondence between the presiding elder and a number of ministers of colored churches in Birmingham and vicinity on the one side, and representatives of the Democratic party on the other, and it has been endorsed by leading Democratic newspapers. The ministers complained that the law requiring equal accommodations for the two races on railroads had been a dead letter, and asked that it be enforced and that colored passengers be freed from the intrusion of convicts and other disreputable characters. They asked that "like punishment be given for like offences," pointing out that to send a negro to the penitentiary for larceny and to acquit a white man of murder is a license to crime, can result only in disorder, and is a constant menace to good order and the enforcement of the law. Pledging themselves at all times to do all in their power to enforce the law and maintain peace and order, they asked that their race be protected in their lives and persons, and in the exercise of their right to labor in any position for which their moral and mental capacities may fit them. In conclusion, they promised to stand by that man or party who would guarantee them these rights.

---

This communication was submitted to leading representatives of the Democratic party, including Mr. H. C. Tompkins, chairman of the State executive committee, who said in his reply:

"Of course I have no authority to speak for the party as a whole, but I know that the members of the executive committee, of which I am chairman, and the members of the party generally, believe that the negro race are entitled to those things which they ask in that communication, and that the laws giving them should be enforced; and if it is necessary to enforce them to enact new laws, then I know the Democratic party will pass them. I have no hesitation in pledging you to use whatever influence I may possess in securing to them their full rights before the law, and in seeing that the people of that race are protected in their lives and persons, in all their rights before the law, and in the exercise of their right to labor in whatever occupation they may be employed."

It should not escape notice that this movement toward better relations between the two races in a Southern State follows the repeal of the federal election laws.

---

The Democrats in Tennessee are found to have lost ground in last week's State election for judges of the Supreme Court, to such an extent that the Republicans ought to have carried the day. But the Republicans also lost ground in their strongholds, so that the Democrats retain control. This is really an ideal result. The Democrats ought to suffer everywhere for the incompetency displayed by the party in Congress. On the other hand, the Republicans of Tennessee ought to be punished for "fusing" with the Populists, and endorsing as the candidate of the latter party a man whose only distinction is that he voted for the salary grab in Congress twenty years ago, and held on to the money in the face of public indignation.

---

The small vote cast shows the deterrent effect of a poll-tax. The law requires the presentation of a poll-tax receipt before a man can cast his ballot, and a Nashville paper pointed out the other day that, while there were about 16,000 registered voters in that county, the number who had paid the tax was small. The intention was to diminish the negro vote, but it is found that a large proportion of the whites will not pay the tax. Then there is always a chance that some political manager may suddenly turn up just before election day with a pile of money and pay poll-taxes by the thousands, on the agreement that the voters thus favored will support his side. This is the game which Mahone played on the Democrats of Virginia, and they were glad enough to abolish the system as soon as they recovered control of the State. The theory that a man should pay at least as much as a poll-tax towards the support of the Government as a prerequisite to having his say in deciding its character sounds all right, but in practice it generally works to the advantage of corruptionists.

---

The Michigan Republicans have made a strong bid for the silver vote. A minority of the committee on resolutions reported in favor of free coinage at the ratio of 16 to 1, and although this proposition was rejected, a plank was adopted which "recognizes the so-called silver question as one of the paramount issues of the day," declares that the Republican party is "the only party that can give a wise and adequate solution of the problem," and pledges that party in Michigan to "use every effort in its power to restore silver to its historic position in the United States as a money metal"—whatever that may mean. It is explained that this pledge is made "in the belief that permanent prosperity will not be assured or justice done until silver takes its place side by side with gold as one of the two great money metals of the world." The only thing plain about such a deliverance is, that the framers of the platform are ready for any compromise with the silver men which promises to help the party. It is in the sharpest possible contrast with the previous clear and straightforward declaration of the Wisconsin Republicans for sound money.

---

It is discouraging to learn that the committee on State prisons, in the New York Constitutional Convention, has decided to report favorably an amendment to the Constitution prepared by the representatives of the labor-unions for the purpose of preventing the employment of convicts at remunerative work. This amendment, which is entitled by the New York *Tribune* an amendment "to protect honest labor," directs the Legislature to provide for "the occupation and employment" of convicts, but forbids any convict to work "at any trade, industry, or occupation wherein or whereby his work or the product or profit of the work shall be farmed out, contracted, given, or sold to any person, firm, association, or corporation." Exception is made in the case of work done for, or goods disposed of to, the State or any subdivision thereof, or any public institution. It is quite consistent with the theory of protection to support such a measure as this upon the ground that it will prevent the competition of criminals in industries practised by honest workingmen; but it would be more consistent if the exception were not made. It is perfectly clear that if the State and all its subdivisions and all public institutions were prohibited altogether from employing the labor or buying the products of convicts, they would have to hire honest men and buy the products of honest labor. It is equally clear that, by excluding the competition of convicts in this way, the wages of free labor would be increased. The exception is therefore inconsistent with the theory of the amendment and with the theory of protection, and should be stricken out. If we held to the protection theory, like the *Tribune*, we should insist that no convict should lift a finger at any trade, or do a stroke of work for himself or any one else. Let them be forbidden to wash their own clothes or clean their own cells, thus giving honest washerwomen a chance to practise their laborious but commendable art. Let honest trade-unionists be hired, at regular union wages, to do the baking and the cooking, and to make the shoes and the clothing for the whole of our prison population. The right to labor is a sacred right, and no convict should be permit-

ted to exercise it so long as any freeman can be found to take his place.

---

The *Financial Chronicle* publishes a table of Government receipts and disbursements for each month since January 1, 1894, and for the corresponding period of 1893, which tend to show that the corner of the bad times has been turned and that we may fairly look for a gain, from this time forward, both in total receipts and in the gold balance. The receipts for July were $35,697,000, and the disbursements $37,590,000, showing an apparent deficit on the month of about $2,000,000. But the July interest payment of $7,000,000 came in that month, while the average interest payment is only $2,500,000 per month. If we consider the latter the amount fairly chargeable to the July disbursements, there is a surplus of $2,621,000 for the month. This is in part due to unusually large withdrawals of distilled spirits from bonded warehouse—a condition which is likely to continue, however, during the present month. The *Chronicle* thinks that we are likely to import gold during the next few months. Certainly there is nothing that London could more easily spare, the Bank of England holding at the close of last week over $190,000,000 of that metal—a sum quite unprecedented in its annals.

---

A very remarkable and interesting event happened on Monday, when, for the first time in economic history, the price of corn on the New York market rose above the price of wheat. The significance of this event becomes more striking, and its economic meaning plainer, when it is recalled that throughout our entire industrial history, until the recent vast extension of wheat culture, the price of wheat averaged double that of corn. Moreover, while wheat sells now for barely half the price it reached as recently as 1891, corn is ruling well above the level of such years as 1878 and 1879, when the paper inflation premium on prices for the first time vanished. Nor is this difference due alone to possible damage to this season's crop, for at least 600,000,000 bushels could be deducted from the Government's latest estimate, and still leave a yield of corn as large as that of 1878. It scarcely needs demonstration to make clear that if silver demonetization had broken the price of wheat, the present advance in corn, even with the undoubted speculative exaggerations, would have been wholly impossible.

---

While we are in the thick of our fight against the protectionists, it is encouraging to learn that they have been overthrown in New South Wales. This probably indicates a return by that colony to its time-honored policy of free trade. We say probably, for although sixty-five free-traders have been returned to Parliament and only forty protectionists, there are twenty labor representatives—a sufficient number to make trouble; yet as they numbered thirty-three in the last Parliament they are not so likely to be courted by the politicians. Indeed, it is highly to the credit of Sir Henry Parkes that, after he was driven from office, he declined to form any coalition with the labor faction, but informed the Government that he should support it on all questions except protection. The victory of the free-traders appears to be more complete if we bear in mind that the new Parliament contains but 125 members instead of 141. Had the diminution been evenly distributed, each of the parties would have lost eight members. As it is, the gain of the free-trade party is not three, but eleven members. According to precedent a certain number of the labor representatives are sure to vote with the free-traders. In addition to the relief of trade, Sir Henry Parkes's policy embraces federation of the Australian colonies, retrenchment, and land settlement. To accomplish federation will be as difficult as it was to unite our colonies after the Revolution, but the free-trade victory will enable Sir Henry Parkes to offer the abolition of intercolonial duties, which is of course of the first importance.

---

Apropos of the talk of an income tax in France, Paul Leroy-Beaulieu recalls a saying of Saint-Simon which legislators in England and this country who are boasting that they have got their hands on the throats of rich men at last, would do well to consider. We can easily imagine, said Saint-Simon, what grief it would cause France if the King and all the royal family, the ministers, the marshals, and the prefects should suddenly die. Yet how short a time, after all, would it take the country to recover from such a blow. But suppose a plague should carry off 1,000 of the leading manufacturers, as many of the chief merchants, an equal number of the great land-owners, and the first men in all the professions: it would take a half-century for the nation to regain the ground lost by such a calamity. In the same way, proportionately, any law which tends to fine successful men for their success and to discourage the higher business and professional talents by taxing them, is a crippling of the productive energy of a country. This is especially the case when an animus like that which manifests itself against enemies of the public welfare is put into legislation against the rich. If the hatred of his kind is to be added to discriminating taxes on the rich man, the incentives to the accumulation of wealth will be enormously diminished, and the prayer of Agur, "Give me neither poverty nor riches," will become popular. If granted, it might bring more individual content in certain cases, but it would fatally lessen the chances of millions to earn their daily bread, which now comes to them in industries that would be impossible but for great stores of wealth.

---

No great addition to our knowledge of anarchist psychology was made by the judicial examination of Caserio. The mental history of Carnot's assassin appears to have been not essentially different from that of Vaillant or the Spaniards, Pallas and Salvador. Simple-hearted and ill-balanced natures, generally with a screw loose somewhere in their family history, they go on peaceably and harmlessly enough till they happen to fall in with the doctrine that the existing social order is unspeakably bad and incurably corrupt and ought to be destroyed. This view takes complete possession of them. They hear with joy of the exploits of dynamiters, as of heroic reformers, and come themselves to fling a bomb or wield a dagger with the conviction that they are true servants of humanity. Now the existence of such natures in great numbers must be recognized, along with the fact that they put a new and heavy responsibility upon all who discuss questions of social reform in public. With these powder-barrels standing by uncovered, no man ought to go carelessly dropping sparks, in the shape of vague assertions that society is unjust and that a better order is possible through some kind of a struggle not specified.

---

To be specific ourselves, the sort of thing to be condemned as a needless provocation to anarchy is exemplified in Mr. Howells's article in the August *Harper's*. In it he turns wholly aside from the main purpose and interest of his subject to speak of his "dream of a truer social order," and to assert that there is a "struggle now at hand" to free the world from "industrial slavery" and "the infinitely crueller and stupider vanity and luxury bred of it" than was bred by "chattel slavery." Such remarks can only be considered as inflammatory—we speak of their effect, not of their intention. If a man has anything serious and reasonable to say about such subjects, let him say it in a fashion that can be met by straightforward argument. Rational presentation of socialistic views is harmless beside these vague appeals to passion. We do not suppose that Mr. Howells's 'Altruria' has conveyed any anti-social impulse, or any clear idea whatever, to any of his readers. But what he and all who write for the public ought to understand is, that to inflame the passions of the weak-minded by such utterances as we have cited, with no attempt to justify them, is to assume the very gravest responsibility.

*PRAISE TO WHOM PRAISE IS DUE.*

THE circular addressed by President Fish of the Illinois Central Railroad to the employees of that corporation, which has just been published, will be read with gratification by every conservative citizen. Mr. Fish states that, with few exceptions, the employees of the company remained faithful to their obligations. They performed their duties without flinching, and exhibited a coolness, steadiness, and intrepidity in trying situations which merit the highest praise. For their resolute and efficient efforts to overcome the malignant violence of the mob, and for their extraordinary exertions put forth in the face of great difficulties to protect the property in their charge, President Fish expresses, in behalf of his company, his heartfelt thanks. In this sentiment the community at large may properly join.

For it should not be forgotten what loyalty and fidelity signify under such conditions as existed at the time of the Chicago riots. It is altogether natural and altogether right that men dependent upon their daily labor for their daily bread should be united by the strongest bond of sympathy. Any increase that they can gain in wages means for those who are not vicious a positive increase in the comforts of their homes: better food, better sanitary conditions, better medical attendance, better clothing, more books, more of the "sweetness and light" which outweigh most material comforts. Nor is it in the least to be wondered at if men of this class believe that such gains are to be made only by concerted action on their part. The very atmosphere in this country is permeated with the fallacy of protection. American workmen have been brought up to believe that their comparatively high wages have been due to the imposition of taxes by Congress. They unquestionably believe that this beneficent governmental power has been utilized by the rich men of the country for their own benefit, and Heaven knows there has been ground enough for their belief. A struggle for higher wages, therefore, enlists the heart of every workingman, and neutrality in such a struggle is felt to be a kind of treachery. To incur the odium involved in defeating the purposes of strikers involves no small degree of courage. When this odium is deliberately incurred from the conviction that the methods of strikers are prejudicial to the common welfare, we have a display of patriotism in its most genuine form.

But it is not only unpopularity that threatens these men who have risen superior to the prejudices of their class. Many of them incur danger, as is forcibly set forth in the following extract from the *American Architect and Building News:*

"Few persons outside the ranks of certain trades realize the force of the appeal to fear which Debs and his like bring to bear on those whom they wish to subject. The temper in which the ringleaders, encouraged by official apathy or sympathy, were disposed to deal with those who resisted their dictation, is sufficiently shown by the circular placarded about the Chicago stock yards, denouncing the men who returned to their work as 'scabs,' and calling upon all persons to 'treat them as such,' accompanied by other posters, explaining the latter expression by advocating that all 'scabs' should be immediately assassinated. We, who read of such things in the newspapers with mild deprecation, need, in order to appreciate the resolution required by the faithful engineers and firemen, to imagine the fences around our houses and offices adorned with placards, officially signed by persons intimately connected with the Governor of the State and the executive department of the city, 'branding' us as 'scabs,' and fiercely urging the public to 'treat us as such,' explained by others representing us hanging to lamp-posts, and inviting all persons out of employment to join at once in carrying out this amiable suggestion. If, in connection with these incidents, we were to miss, at frequent intervals, our associates in business from their accustomed places, a blood-stain at their doors indicating what had become of them, we must acknowledge that we should be strongly tempted to close our offices for a time; and that to go on with our work, simply to fulfil our engagements with our clients, would require a moral and physical courage on which we might justly plume ourselves for the rest of our days. Yet this is just what the men have done who have remained at work during the furious reign of Debs and Sovereign; and, modest as they suppose to be their part in the history of this republic, the country owes them a debt of gratitude which it can never repay. Years hence, when Americans can earn an honest living in their own way, without being 'branded,' or 'treated as such,' at the dictation of any despot, the brave engineers of our Western railroads will, we hope, be honored as they deserve."

This is well and eloquently put; nor is it at all too strongly stated. We are glad that President Fish has taken the opportunity to express this feeling in behalf of the great corporation which he represents, and we are especially pleased to see that he also declares that "the public authorities in every county and town along the Illinois Central Railroad, almost without exception, early saw the imbecility and wickedness of the movement which had been set on foot." Such expressions on the part of the managers of our railroad corporations tend to promote good feeling and to remove unreasonable prejudices. We are of opinion that these managers might, with the approval of the stockholders, go somewhat further, and add to a "vote of thanks" some more substantial recognition of faithful service. We do not believe that men should be paid for patriotism or rewarded for doing their duty. But, as Mr. Fish says, the exertions in this case were extraordinary and the risks undergone exceptional. We do not believe that we misrepresent the stockholders in our railroads when we say that they would heartily approve the expenditure of a portion of their money in paying for services which have had an exceptional pecuniary value to them, and which have cost their employees exceptional sacrifices. We are quite satisfied that it is better to spend money in this way than in rate-wars, or even in political contributions. Possibly a corporation that should adopt such a policy might find itself so strengthened in the devotion of its servants and in the support of the best public opinion that it could defy blackmailing legislation. If the amount of the "corruption fund" could be applied in this way, some corporations might even find it a pecuniary gain. "There is that scattereth and yet increaseth."

*A GAIN FOR CIVIL-SERVICE REFORM.*

THE cause of civil-service reform, as administered by the Commission, has won an emphatic advance, and by an agency from which little was expected this year, namely, by action of the present Congress. It was accomplished in the quietest and most unobtrusive manner, and it may be questioned whether any considerable number of either the friends or the enemies of civil-service reform realize the magnitude of the achievement. The clerical force of the Civil-Service Commission is largely obtained by detailing clerks from the various departments, who then, under the orders of the Commission, perform such examining work as is needed for the service of the respective departments whence they are detailed. Such an arrangement was in every way unsatisfactory. The departments would naturally enough detail the least valuable members of their own forces, retaining the best for their own use, so that the Commission was obliged frequently to send back the detail. In the second place, the clerks naturally disliked to be removed from the regular line of promotion in their own departments and put where they had no such chance, and, knowing that, after all, their destiny was not in the hands of their new employers, they lacked one great incentive to faithful service. It might happen, and it has happened, that a department has, in its determination to be economical, informed a clerk that his services were no longer required after a certain date, while he was doing satisfactory work under the Civil-Service Commission, which was anxious to retain his services.

In order to remedy this uncomfortable state of things, a modest clause was inserted in an appropriation bill, simply putting the clerks detailed from the departments under the control of the Commission, and transferring the appropriation of their salaries from the departments to the Commission; also providing that, in future, estimates for their salaries should be submitted by the Commission and not by the respective departments.

This clause was instantly pounced upon by the spoilsmen in the House of Representatives. They were already armed with more than one amendment to the executive appropriations, tending to destroy, or at least to nullify, the Commission. Feeling only too sure that

these would hardly be adopted in their own house, and certainly not in the Senate, they eagerly attacked the clause just described on the point of order as new legislation. The appropriation committee readily admitted as much, but deprecated insistence on the point of order, and urged the need of the appropriation. It was in vain; out the clause went, to the great satisfaction of those who at the same time were trying to strike from the bill all provision for the Commission. The Senate, however, took a different view of the matter. In that body new legislation may be, and frequently is, introduced by way of amendment. Accordingly, when the legislative, executive, and judicial appropriation bill was reported to the Senate, it contained a clause granting to the Civil-Service Commission a force of thirty-six clerks of its own, duly classified, in place of detailing an equal number from the departments, with an appropriation therefor of $52,000; providing also that the Commissioners might transfer to their own rolls any of the detailed department clerks who had proved useful as examiners.

It will be seen at once how much such a provision increases the efficiency of the Commission and the freedom and spirit of those in its employ. The amendment was agreed to in the Senate with no objections, and with scarcely a word of debate. When the bill came into conference there is no record of any difference of opinion; and when the conferees reported to the House of Representatives that a long string of Senate amendments had been agreed to, including amendment No. 32, assigning thirty-six clerks to the Civil-Service Commission, there was scarcely a member who distinguished this particular clause as part of the statement of the conferees. In the discussion of half an hour that followed, the provision was not mentioned, the report was agreed to, the bill was passed; it has since been signed by the President, and the Civil-Service Commission, by act of Congress, is put upon a firmer and more efficient basis than it ever has had since its establishment, by the quiet, intelligent, and vigilant work of its friends in the Senate, duly seconded by those in the House.

The gain of such legislation to the cause of civil-service reform is greater than might be supposed by one who merely read the text of the clause alluded to. Every step which enables the Commissioners to do their work more speedily, efficiently, and systematically makes the results of that work more completely felt by the people and by the departments. As long as they were to some extent dependent on those departments for the very machinery by which they worked, there was, there could not but be, a feeling of uneasiness and strain in all their operations. Now that they can work for themselves, and their force, small as it is, is their own, they will undertake more than ever to demonstrate that their service is needed by the country; that the more efficient it is, the more acceptable it will be, and that the institution which has outlived so many attacks from open and secret enemies, responds to a real demand from the country which no future Congress will dare to undervalue or reject.

## *OUTSIDE INTEREST IN THE ORIENTAL WAR.*

THE merits of the quarrel between China and Japan remain for most people in this part of the world as obscure as they have been from the beginning. Nor is there, apparently, any preponderance of sympathy here for either party to the struggle. Yet it is evident that, since it was settled that the controversy was to be referred to the arbitrament of war, no little interest has been taken in the contest by those whose direct concern in it is hard to see.

A part of this interest comes, no doubt, from the old idea that the adversity of others means our own prosperity. In spite of the frequent demonstration of the commercial and financial solidarity of the world, the fancy still lurks in many minds that it would be a splendid thing for our trade to have some other nation or nations crippled by a war. "A general war in Europe" used, in fact, to be thought an infallible remedy for all our industrial ills, just as the Napoleonic wars used to be regarded by the squires of England as the *sine qua non* of English prosperity. This idea has survived, like so many other economic fallacies, long after the brains were out of it, and one hears people talking as if the war in the Orient might be a godsend to us and prove the turning of the tide of our financial depression. But commerce does not catch fish in troubled waters. Even the apparent stimulus which comes from placing orders for war materials will not inure to the benefit of this country, as England is in the way of getting pretty much all of the trade of that kind which the war may create. So that, as far as we are concerned, the idea that the troubles of others mean our own happiness is not likely to receive so much as surface confirmation. Substantial injury to our trade in the East is a far more probable result than apparent benefit to it.

Another way in which outside interest is shown in the struggle between Japan and China is perhaps more rational, though equally selfish. It springs from a desire to have a demonstration, at the expense of somebody else, of how modern men-of-war and armaments will stand the test of actual warfare. It is a fact, which disturbs the sleep of naval constructors, that none of them can appeal to actual experience to say how modern ironclads are going to behave in real battle. Every civilized nation has gone on building them and making them huger and (on paper) deadlier, but there has long been a nervous feeling that they might not act, in the water and enveloped in smoke and with torpedoes dashing at them, precisely according to theory. Since the battle of Lissa in 1866 there has been no satisfactory fighting test of the modern armored battle-ship, and naval experts have a consuming anxiety to see one. Some of our hotspur naval lieutenants are willing enough to make the test themselves, but nearly all others who take an interest in naval warfare would prefer to see other countries made the subject of experiment. What better *corpus vile* could be found than the half-civilized Japanese and Chinese?

There is, in fact, an added interest for the spectator in the fact that the contestants are but half-civilized. They have been playing at the game of civilized life for some years now, but there has been all the while on the part of Western nations a half-amused feeling that it was all a pretty farce. How will the veneer of civilization stand the friction of war? Will the laws of war be observed by powers that only lately and reluctantly have given their assent to the modern doctrines of international law? The atrocities in the naval battle already fought make this seem highly doubtful. Then, how are these men going to manage the arms of precision with which they have been hastily equipped? It is probable that their war-ships will be commanded by foreigners; but in the end, and if the struggle is as prolonged as now seems likely, the thing will come down to their own capacity to handle battle-ships and serve artillery. Have they the technical skill and the flexibility of nature to adapt themselves to these strange conditions?

Far more profitable is it for outsiders to give their attention, as some are doing, to the lesson in government which Japan is setting the world. As far as she is concerned, it is fairly evident that the war has been undertaken in a Jingo spirit, to divert attention from the difficulties at home. The Government has twice had a deadlock with Parliament in the past few months, and has twice dissolved it in the hope of getting a more manageable majority. The elections to the new Parliament are to be held this month, and the Government has obviously been willing to get a pliant majority by appealing to the war spirit and thus overshadowing the immense difficulties of domestic policy which confront the nation. It has borrowed representative institutions, as well as modern arms, from Western nations, and now it is letting go the former to use the latter. The energy and intellect of modern Japan, great as they are, are none too great to devote

themselves exclusively to the arduous task of fitting their country for the peaceful assimilation and development of modern ideas, in government as well as in science. To give over this great work and plunge into war is little short of a sheer reversion to barbarism.

Certainly, if Japan is successful, the consequences will be important, not only in checking her republican development, but in seriously complicating her foreign relations. Success now undoubtedly means a foothold on the continent. Japan talks of reforms in the Corean government, but it is the Corean territory she has her eyes upon. She will take that and as much else as she can wrest from China, if strong enough. Nor will she omit to claim any of the Pacific islands which she thinks essential to her predominance. Once shown to be the aggressive and rising power of the East, she will not rest for a day under those treaties with other powers which limit her sovereignty. Victory in the war against China would mean speedy and serious complications with all those powers. But she will not be victorious if the superior numbers and the tougher fibre of her antagonist can be squarely brought into a contest with her more brilliant but less solid qualities.

## THE FRENCH POPULISTS.

PARIS, July 16, 1894.

THE most far-reaching and important result of last year's Parliamentary elections in this country was not the almost entire annihilation of the monarchical parties and the consequent overwhelming victory of the Republicans; it was the choice of some fifty out-and-out socialists—miners, mechanics, agitators, and, in two or three cases, politicians of solid education, wide legislative experience, and remarkable oratorical gifts; M. Jean Jaurès, for example, being one of the most brilliant debaters on the floor of the House.

At first militant socialists held aloof from politics. A seat in the Chamber of Deputies seemed to have no attraction for them, while the mere mention of the aristocratic Senate put them in a rage. But this aversion for the Palais Bourbon and the Luxembourg gradually disappeared. The attention of the whole nation was so absorbed during the first years of the present republic in the bitter struggle over its foundation that socialism, which in one form or another has always had a following in France, was relegated to the background. But in 1888 a sufficient number of pronounced socialists, or so-called socialists, had succeeded in securing seats in the Chamber to warrant the formation of a "group." Though a score of names were found on its list, probably not more than a dozen were those of genuine socialists. The little company kept on growing, however, from year to year until it has become a factor that can no longer be neglected in parliamentary computations. For instance, to cite but one example out of many, the overthrow last May of the Casimir-Perier cabinet was due, in large measure, to this group of socialists.

How completely the early antipathy for public life has disappeared from among the socialists is strikingly shown by the fact that "Citizen" Thivier, the peasant Deputy who attends the sittings of the Chamber attired in the traditional blouse of his class, did not hesitate recently to stand for the much-vilified Senate—the first instance, I believe, of a socialist taking this step. He even offered as a bait for votes to add wooden shoes to his blouse if elected. Another example of this change of front was seen when M. Floquet came forward for a seat in the same body. On this occasion the socialist delegates in the college pronounced themselves almost to a man in favor of sending up their friends to the Upper House.

The following extract from a letter of M. Toussaint, one of the Paris workingmen Deputies, gives the reason why the Socialists now desire to enter Parliament:

"We know full well," he writes me, "that none of our demands will be acted upon by the present Chamber. Consequently our rôle consists in producing in the Chamber and in the country the greatest possible amount of agitation, by which means we hope to awaken the masses and convince workingmen that, in the struggle for emancipation, they can count on themselves alone; that it is only by grouping ourselves into societies and clubs for the study of social questions that we shall be able finally to form an organization solid enough to wrench from the capitalist class those privileges which it will not abandon unless forced to do so. But, in order that the economic revolution for which we are preparing the way may be durable, it must find acceptance in men's minds. This is the difficult task to which our Deputies are addressing themselves with all the energy they possess."

M. Jules Guesde, one of the boldest and most extravagant of the "revolutionary socialist" Deputies, a thorough-going advocate of "propagande par le fait," thus expressed the same idea in a recent speech:

"Those who count on the socialist Deputies for the triumph of our ideas will be disappointed. We do not intend to ask the Chamber to really carry out our programme. We shall not waste time in trying to convert our colleagues. It suffices us to combat them. It is the country we are laboring to bring over to our ideas. We shall call upon the nation to accomplish, by its own efforts, the social revolution. We look upon Parliament simply as a means for propagandism. It furnishes us our tribune. It is a new instrument of publicity which has been placed at our disposal. Far from us the chimera that our social revolution can be brought about by parliamentary or constitutional measures. We make no distinction between legal and illegal action. We enjoy the benefit of being able to have recourse to one or the other, according to circumstances."

And this programme is being followed to the letter, and even with considerable success. The socialist Deputies have provoked during the past year several general debates and won one or two moral victories. They have also called public attention to their cause by the introduction of various bills, none of which, however, has passed. One of these, fathered by M. Goblet, has to do with mines and miners, and its capital clause, which will kill it, declares that if a strike continues beyond a certain period, the State may step in and withdraw the concession without indemnifying the company. The object of a second measure, which originates with M. Jaurès, is to put an end to the complaints of the agricultural classes, whom the socialists are now exerting every nerve to bring over, about the competition caused by foreign corn. This desideratum is to be attained by the State assuming the monopoly of the buying and selling of this import. Thus, according to the project, the selling price will be kept constant whatever the purchasing price may be.

It may be well to describe now, briefly, the nature of the organization of this Socialist, or Workingmen's party, as the leaders prefer to call it. Its origin is the famous International Association of the epoch of the Second Empire, though its present form is the result of many congresses held in the various capitals of Europe during the past twenty-five or thirty years. M. Victor Dejeante, a hat-maker, who represents one of the Paris districts in the Chamber of Deputies, has kindly furnished me a description of the organization of this body, from which it appears that the party is made up of "regional federations." Each federation has its headquarters in the city which is the acknowledged industrial centre of the surrounding country. Correspondence between the various federations is carried on through the general secretary of the party appointed by the federations themselves. There are two sorts of bodies in these federations—trade societies, and clubs devoted to the study of social questions. The members of the latter are generally members, also, of the former, so that the ideas prevailing in the clubs are spread among the real workingmen. When election day comes round, these clubs are easily converted into election committees that aid in every possible way the triumph of the labor candidates at the polls. The Workingmen's party is thus exceedingly well organized for conducting a political campaign, and as none of the other parties knows what organization is, at least in the American sense, this may go far to explain the success of the socialists last year at the ballot-boxes.

Now a word about the Workingmen's platform. The "legislative programme" adopted and revised at several congresses contains, among a long list of whereases, the following: "The emancipation of the laboring classes can be brought about only through their own efforts"; "The subjection of labor to capital is the source of all political, moral, and material servitude; hence the economic enfranchisement of labor is the principal aim to which every political movement should be subordinated"; "The emancipation of labor is not simply a local or national problem, but, on the contrary, interests the working classes of all so-called civilized countries." Whence the four following resolutions: "The final aim of the party is the complete emancipation of all human beings without distinction of sex, race, or nationality." "This emancipation cannot be accomplished until the socialization of the materials of labor gives rise to a communistic state of society in which 'each, giving according to his strength, will receive according to his needs.'" "In order to attain this end, it is necessary, on account of class distinction, to keep up a political party in opposition to the various political parties of the middle and upper classes." "This enfranchisement can be secured only by revolutionary measures; hence the reason for seeking to gain a foothold in the public assemblies of town, province, and state, to be used for purposes of propogandism."

The platform consists of two parts—one purely political and the other economic. Under the first head are demanded the following reforms: Direct legislation by the people, the American town meeting and the Swiss *referendum* being in the minds of those who introduced this "plank"; the consideration, during the session in which they are introduced, of all bills emanating from workingmen's organizations; an elective judiciary; the gratuitous administration of justice; removal from the code of every discrimination unfavorable to the laboring classes, women, or natural children; the suppression of standing armies; the general arming of the people, and the development of

local self-government. In economics, the platform calls for a complete system of free education; one day's rest in each week; a working-day of eight hours for adults, six for those under eighteen, no night work for children, and only six hours of night work for adults; workingmen's corporations to fix the scale of wages, with fines and imprisonment for employers who offer wages below this scale; the holding of employers responsible for labor accidents, and requiring them to pay compensation in proportion to the degree of injury done to their employees; equal pay for equal work, without distinction of sex; the prohibiting of employers from imposing fines or reducing wages in any way; the appointment of inspectors, chosen by the workingmen's corporations, whose duties shall be the examination of workshops, factories, mines, etc., in order to pass on the nature of the work, the hygienic arrangements, the precautions against accidents, etc.; the suppression of the public debt; the assumption by society of the support of the old and sick of the laboring classes; the abolition of all indirect taxation and the establishment of a single tax, of a decidedly progressive nature, on all property, both capital and revenue—with an exception, however, in favor of persons whose income does not exceed 3,000 francs a year; a return to the State of all inheritances in collateral line; and, as regards direct inheritances, a return to society of all above 20,000 francs.

The Republicans in Parliament have not been slow, especially during more recent years, in trying to check the advance of socialism by forestalling the demands of the leaders. It cannot be denied that the Third Republic has already done a good deal to ameliorate the condition of the French laboring classes. Some of these innovations were pointed out by Advocate-General Sarrut in his speech before the Paris Court of Appeals at its annual opening meeting in October, 1890.* The fact of such a personage selecting such a subject for his discourse on such an occasion is significant in itself. But M. Sarrut did not exhaust the list, and new measures of a similar kind have been added since he spoke. The establishment of hundreds, perhaps it would be more correct to say thousands, of free schools; of popular savings banks, benevolent societies, pension funds; the passing of laws for the protection of women and children employed in factories and of employees in general against accidents; the appointment by the minister of commerce of a Superior Council on Labor, composed of well-known specialists whose duties are the study of labor problems, and by the Chamber of Deputies of two standing committees of thirty-three members each, empowered to examine and report bills on this same subject—such are some of the more prominent acts of the Government and Parliament in their efforts to satisfy the demands of the French Populists.

But in their attempt to check "the socialistic endosmosis," as M. Yves Guyot describes the tendency I have been dwelling on, the Republicans do not confine themselves to legislative bills and lyceum discussions. They have long been keeping up a heavy fire of hot shot from the hustings, the printing-presses, and the newspapers. "To count upon Revolutionary Collectivism bringing about social progress," says one of their organs, "would be like expecting hail to ripen the harvest, or hate to produce fraternal union, or intestine war to increase the strength and happiness of a nation." Whereupon the French Populists reply in the words of M. de Rémusat: "No tradition possesses absolute and definitive authority; a step in advance is always possible in everything"; or in these of Heine: "We have for eighteen hundred years been giving Cæsar far too much; what remains shall now be for us."

## MT. MONADNOCK AND BEN NEVIS.—I.

ENGLAND, July, 1894.

AFTER reading books and special articles, after poring over maps and sections of foreign lands in the effort to compare them justly with one's home country, it is a rare pleasure to stand on their hills and see the original "copy" of the books and maps outspread to the horizon. So it has been in the last month, in a comparison that I have sought to draw between the geography of our New England plateau and that of the Scotch Highlands. The comparison is not so much concerned with area or height as with geographical development, in which the two regions resemble each other somewhat closely. Following various students of the question at home, of whom Prof. Emerson of Amherst was the earliest, it is now generally understood that our New England upland is an old mountain region, once rising to great heights, as is indicated by the extreme distortion of its rocks; that its latest period of mountain growth is nevertheless so long past as to have allowed the destructive forces of the atmosphere to wear the mountains down to a lowland of moderate relief close to sea level—to a *peneplain*, as I should term it; and that only after the broad uplifting of this lowland to a gently slanting upland were the present valleys excavated in it. The lowland was not worn down perfectly smooth by any means. Remnant mountains rose above it, for they still surmount the upland. The type of such remnants of the earlier cycle of erosion may be found in Mt. Monadnock, a grand conical mass in southwestern New Hampshire, rising about sixteen hundred feet above the plateau platform, which is there another sixteen hundred feet above the sea. Indeed, I hope that other writers may follow the example of Messrs. Hayes and Campbell in their recent admirable account of the Southern Appalachians, and employ Monadnock as the generic term for all such residual mountains that rise over uplifted plateaus of denudation. The White Mountains appear to be simply a cluster of Monadnocks, preserved by some peculiarity of structure or drainage not yet fully explained.

The valleys that have been eroded in the New England upland since its slanting elevation follow a simple law. They are shallow near the coast, where the uplift was small; they deepen inland, where the uplift was greater. Indeed, it is largely from this variation in the depth of the valleys that the unequal uplift of the old lowland to a slanting upland is determined. The valleys are still narrow where the rocks are resistant; but they are already broad where the rocks are relatively weak. The Connecticut and its branches illustrate all these features. Near Long Island Sound, the river has incised its valley only one or two hundred feet beneath the upland; in northern Massachusetts it is fully a thousand feet beneath the plateaus east and west. The Deerfield River, entering the Connecticut from the Hoosac tunnel district, runs in a deep and narrow valley—deep, because cut in a high upland; narrow, because the crystalline rocks there are so resistant that there has not yet been time for the valley to widen greatly. The Quinipiac, entering the Sound at New Haven, drains a broad and relatively shallow valley—broad, because the red sandstones there are comparatively weak and have already been greatly consumed; shallow, because near the shore the upland has only a moderate elevation.

The rolling upland, with its scattered or grouped Monadnocks, and its broad or narrow, deep or shallow, valleys, has been glaciated since its present form was essentially assumed; but to this peculiar episode in its history we owe many of its smaller features, such as the lakes and gravel-beds, especially in the valleys and lowlands. The region now stands somewhat lower than when its valleys were cut out, as is known because the mouths of the valleys are drowned near the coast, forming estuaries so well shown in the Thames from Norwich to New London, or bays like Narragansett; but the region has risen a little since the ice was on it, for the gravel terraces around the coast rise somewhat above present sea-level.

Now, with a considerable exception regarding the evenness of the upland, all these features are found in Scotland, and with remarkable distinctness. During a week's excursion in the Highlands and along the western coast, it was my good fortune to see on the ground and under most hospitable and skilful guidance the classical examples of mountain structure, of denudation, of glacial action, and of old sea margins for which Scotland is famous to geologists and geographers all over the world. They constantly recall examples of home structures and forms, yet always with a strong and interesting foreign flavor. They exemplify at every point that a knowledge of home geography is the beginning of the appreciation of foreign countries. The likenesses to home examples are often well marked, but the contrasts are always entertaining and instructive. From the moment of stepping on the landing-stage at Liverpool, where the party from the steamer were silently awaited by the runners of various railways, each one labelled but speaking no word until spoken to, the likenesses and contrasts began, and the lively procession is still marching by. On the way to Edinburgh, I stopped a couple of hours at Appleby in the vale of Eden, with the mountains of the Lake District on the west, and the bold escarpment of the Pennine chain on the east; this being in the hope that an east wind might blow me at least a good turn, and form the peculiar isolated cloud, known there as the Helm bar, in a great roll of the air current west of the escarpment. The day, however, was fair and the wind was the prevalent southwester, in deference to which many of the trees were growing one-sided. There was no Helm bar, but floating *cumuli* threw climbing shadows over the mountain slope in truly homelike fashion. Moreover, the floor of the valley was rolling with drumlins—great whale-backed hills of glacial drift, familiar all about Boston, where they make the islands in the harbor and many of the hills on the land; but over the hills at Appleby rose the skylarks with eager song, and they have no match at home. Then, like Lochinvar, a run over the border, but unhappily alone; through the bare hills of the southern uplands of Scotland, with their long even slopes, bright with grass or dark with heather; across the open lowlands with their farms and collieries; and at last the spans of the great Forth bridge rose over the treed ridges as the train neared Edinburgh in the long northern twilight.

The Scottish capital gave me a most pleasant meeting with three leaders in their respective subjects: Prof. James Geikie, at work on a

new edition of his 'Great Ice Age'; Dr. Alexander Buchan, by whom the meteorological records of the *Challenger* expedition were discussed, and from whom we shall next have an essay on ocean temperatures and currents; and Mr. J. G. Bartholomew, chief of the Edinburgh Geographical Institute, under whose energetic direction this great publishing house produces about five million copies of maps of many kinds yearly. The office of the Geological Survey of Scotland was also visited in final preparation for the excursion into the Highlands; for unfortunately the publications of the British surveys are rarely found complete at home outside of the governmental bureaus in Washington. Very few copies of the British geological reports and maps are presented to libraries in foreign countries, and the price at which they are sold practically forbids their purchase. The maps are, moreover, colored by hand, so that every copy is expensive; while ours are lithographed, and "additional copies" are of only nominal cost —perhaps three or four cents apiece. The policy of her Majesty's Stationer's Office is in all these matters just opposite to what prevails in our bureaus in Washington. With us the intention is to give as wide a distribution as possible, either free or at a very moderate cost, to the maps and reports whose expensive preparation is warranted only by their general use. The British practice almost seals up the costly results of the geological surveys, and thus greatly diminishes the profit resulting from them. It was a satisfaction to learn that this opinion, formed at home, was shared and emphatically expressed over here.

Distances are so short on the British Isles that the morning steamers leaving Glasgow for the sea lochs on the west coast are overtaken at the mouth of the Firth of Clyde by the early trains from Edinburgh, thus saving a stop over night in the smoky manufacturing rival of the capital. The run through the Kyles of Bute quickly introduces the traveller to the delightful combination of steep highlands and deep narrow waters that characterizes this beautiful part of the world. The Crinan Canal cuts off the long passage around the peninsula of Cantyre, and gives opportunity for a pleasant walk, if the day is by exception not rainy, while the little canal steamer passes up and down through the locks. A third steamer, waiting at the further end of the canal, runs up to Oban in the afternoon, and there most of the passengers disembark, to make the trip around Mull to Staffa the next day, and only the few go on through Loch Linnhe to Fort William at its head, although here the mountains are bolder than any below Oban, the view up Glen Coe from Ballachulish being especially striking. As the upper mountain slopes were much of this day obscured by clouds, a much humbler feature of the scenery attracted my attention. This was the "twenty-five-foot beach," of peculiar interest in the sea lochs from its distinctness and its control of population. It is a mark of wave work when the sea stood higher on the land. There is a cliff from ten to thirty feet in height cut in the mountain side, with caves frequently indenting its level base, and a smooth gravelly or sandy slope stretching two or three hundred feet from the foot of the cliff to the present shore. Where streams from the glens entered quiet water, the beach spreads out into a delta. Where eddying currents carried the gravels outward from the old shore, the beach locally widens, recalling the much larger examples of this process on our coast in Cape Canaveral and its fellows further north. Where the mountains descend abruptly to an exposed coast, as on the promontories between the sea lochs, the gravelly waste from the land was washed away into deeper water by the strong waves, and only a ragged rocky bench remains, now taking the form of "skerries," or low ledgy islands, where the former wave action was especially violent.

It is not too much to say that nine-tenths of the scanty population of this region live according to the opportunity afforded by the gravelly beaches or the sandy deltas of this ancient sea margin. The roads often follow it for miles. The scattered cottages of the crofters are all set back close against the old sea cliff; their little crofts lie on the smooth bench in front, while their cattle and sheep are driven up to pasture on the steep mountain slopes above. There are no cottages on the upper slopes. Villages are strung along on the old beach, assuming a narrow linear form, like the towns along the banks of the Rhine in its gorge. On the deltas, or on the cuspate beaches that have been built outward by ancient currents, there are occasional castles or halls, with shady groves, grassy lawns, and all the elegances of high life, amid the poverty of the smaller folk, up and down the old shore line. The bare skerries support no one but the light-house-keepers; the slopes of the mountains leading down to the exposed headlands are desolate in the extreme. There are miles and miles of bolder coast, seen in a later part of my excursion, where not even a cottage is in sight; no tempting bench of cultivable land invites settlement there. It would be difficult to find a better illustration of the control exerted by past processes on present opportunities, either in their bidding or forbidding aspects.

W. M. D.

# Correspondence.

## MME. DE RIEDESEL ON THE FENTON CASE.

To the Editor of The Nation:

Sir: Mme. de Riedesel, in her memoir, states that the wife and daughter of Capt. Fenton, a Royalist absentee living in England in the time of the Revolutionary war, were tarred and feathered by the rabble of Boston. In my work on the United States I have repeated her statement, as Lord Mahon (Stanhope), in his 'History of England,' had done before me. In the report of a meeting of the Massachusetts Historical Society on January 11, 1894, Dr. Samuel A. Green, in reference to my work, discusses Mme. de Riedesel's story, and comes to the conclusion that it is baseless.

"This German Baroness," he says, "was a guileless woman, unused to the ways of the world—as crops out in her 'Letters and Journals,' etc.—and too readily believed improbable tales. She had never seen the seamy side of life, and her credulity was equalled only by her inexperience. Without doubt the story was told to her, and she jotted it down; but her authority in the matter is entitled to no more weight than specks of dust floating in the air."

I would very gladly cancel the passage if I could persuade myself that Dr. Green's view was right. The exact words of Mme. de Riedesel are:

"I had, during my residence at Bristol, in England, made the acquaintance of a Capt. Fenton, whom the Americans claimed at the beginning of the war, but who remained faithful to his sovereign, and refused to go to America. Upon this the infuriated rabble seized his wife, who was a most respectable woman, and a daughter of the age of fifteen, who was very beautiful, and stripped them both of their dresses, without regard to their moral worth, their beauty, and their delicacy; and after having besmeared them with tar, and covered them with feathers, drove them through the city. What had one not to fear from people maddened to that degree of hatred!" ('Letters and Memoirs,' pp. 196-97.)

In an earlier part of her Memoir, recounting her journey from Germany to America, the Baroness had said:

"I met in the house where I lived in Bristol a Capt. Fenton, whose wife had remained in Boston with a daughter of fourteen. He was a fond husband and a doting father, and begged me to take charge of some letters on my departure for America. On my arrival I learned that, on account of his long absence, Mrs. Fenton had been arrested and suffered much ill-treatment; but of this anon" (p. 74).

She does not say, nor was she specially called upon to say, from whom she had the story. She does not tell us whether she saw Mrs. and Miss Fenton at Boston. But, being acquainted with Capt. Fenton, and having taken letters for his wife and daughter, she is pretty sure to have made special inquiry about them. The date of the occurrence, as to which Dr. Green raises a question, is not given, but we must suppose that it was between the evacuation of Boston by the British army and the arrival of Mme. de Riedesel.

Mme. de Riedesel states that she was herself insulted by people of the baser sort at Boston; that the persons of her own sex were the worst; that they gazed at her with indignation, and spat when she passed near them. We can hardly reject her evidence in this case.

As a German, the wife of a commander of auxiliaries, Mme. de Riedesel little shared the passions of the civil war. I have, in fact, found in her Memoir only one spark of royalist emotion, and this was elicited by singing in her presence "God save good Washington and God damn the King," which must have pained her the more because she had been very well received by the royal family in England. When she is kindly treated by Americans, as she often is, she heartily acknowledges the kindness. Nothing can be warmer than her tribute to the generosity and chivalry of Gates and Schuyler. I see no indications of weak credulity in the Memoir. On the contrary, I should say that it was the work of a woman of sense, as well as the picture of a very attractive character and of rare conjugal affection. A woman who had followed a camp, and a motley camp such as that of Burgoyne, must surely have seen the seamy side of life. Indeed, she had seen not a little that was seamy on her travels before she joined the camp.

The silence of the Boston journals of that day, which Dr. Green proffers as negative evidence, seems natural enough. The incident was one which they would hardly like to chronicle. The negative evidence of the kindred of the Fentons in Boston, which Dr. Green also urges, will have more force than the silence of the journals, provided Dr. Green can tell us who the kindred are and what it is exactly that they say. No positive evidence is adduced by Dr. Green.

It appears from Dr. Green's paper that Capt. Fenton was an object of special odium as a noted Tory who had been expelled on account of his political proclivities from the Legislature of New Hampshire, had been afterwards arrested by order of the Provincial Congress, and was accused of having violated his parole, which bound him to take himself in the first instance to New York. The last circumstance seems to explain Mme. de Riedesel's otherwise

unintelligible expression as to the Americans having "claimed" Capt. Fenton at the beginning of the war.

It was by an infuriated rabble, Mme. de Riedesel says, that the outrage was committed, and Dr. Green will hardly think that there is a limit to the excesses of which an infuriated rabble, even at Boston, can be guilty in a time of civil war. GOLDWIN SMITH.

TORONTO, July 21, 1894.

## THE SILVER EVIL.

TO THE EDITOR OF THE NATION:

SIR: People who think are at present becoming so impressed with the mischief of the so-called protective system fastened on the country by a greedy minority and now fighting desperately for its life, that it seems to me another equally potent cause of disaster is in danger of being momentarily neglected.

The country has been engaged for years in a gigantic silver speculation. We have attempted to "corner" the commodity by buying immense quantities and struggling to convert it into money at double its value by the power of Congressional fiat. Like most other attempted corners, this has failed, but the worst of the effects remain, and must remain till we retrace our steps. The millions of silver dug up on Western hillsides and now reburied in Eastern vaults, of itself merely involves a pecuniary loss which the country is rich enough to stand. But unfortunately we have borrowed upon it; that is, we have issued an overwhelming and redundant mass of silver certificates and notes "based" upon it, to which paper, though it possesses no value anywhere else, we have in effect given the legal-tender quality as against our own people.

Probably almost every one who addresses himself intelligently to this subject is familiar with the financial canon known to the world as the law of Gresham. It is the principle which assures us that in any country whose aggregate currency is redundant in quantity and composite in quality, the best will tend to disappear from circulation by either hoarding or exportation. Now the present currency of the United States includes eight different kinds, and is absurdly redundant in quantity. Notwithstanding the financial wisdom of backwoods conventions, it is probably two or three times more than is required by a people whose entire pecuniary transactions—95 per cent., as we are credibly told—are conducted by checks and credits.

Under these circumstances, no one need be surprised at the continued efflux of gold under any and all probable conditions of international credit and rates of exchange. It seems to me that Gresham's law is asserting itself as vigorously as can be reasonably expected. Gold and gold certificates have gone out of common use. Greenbacks redeemable in gold have followed suit. National bank-notes payable in greenbacks are no longer profitable, and are being steadily withdrawn. We have, in fact, a badly inflated silver paper currency, and no other, although as yet expressed in terms of gold. It continues to be so expressed because we know the Government can, and most of us believe it will, maintain this silver paper at par by purchasing it, when required, with gold borrowed for the purpose or wrung from the taxpayer. Every dollar of it represents simply a debt of the Government (*i. e.*, the taxpayers) to meet which there is nothing besides taxes and some thousands of tons of depreciated silver, for which there is no market, the demand being fully supplied from current production. We may as well accept the fact, than which few are more certain, that the world whom Congress cannot reach by law will continue to refuse this paper, and it must all be taken up with borrowed gold if the country is to maintain solvency. When that process shall have been seriously begun and honestly completed, and when Congress will let the people's industries alone and abandon its mischievous tendency to enact prosperity by statute, then we can look for nothing less than the most prosperous commerce and industry in a land so abounding with individual energy and natural resources.

Very respectfully yours,
I. J. WISTAR.

PHILADELPHIA, July 30, 1894.

## TEMPERATURE AND VERTEBRÆ.

TO THE EDITOR OF THE NATION:

SIR: In Mr. Jordan's own 'Contributions to North American Ichthyology,' p. 307, in the genus *Oncorhynchus*, a Pacific salmon, *O. chouicha*, or quinnat salmon, is said to possess 66 vertebræ, and to often attain the length of 3 to 4 feet, and to have been known to attain a weight of 100 or more pounds. (This fish, by the way, should retain the specific name of *quinnat*, which everybody from Alaska to Greenland, almost, knows, rather than *chouicha*, a name changed from another name, which everybody does *not* know.) It is well known to eat up both the *old* and the *young* of its neighbor, *O. nerka*, a smaller species having only 64 vertebræ. The latter, in its struggle to get away from its more voracious neighbor, ascends the stream to its highest source. S.

GEORGIA, July, 1894.

[This note relates to objections urged by us (*Nation*, April 19) against acceptance of Prof. Jordan's theory of "temperature and vertebræ" in fishes. It was inspired by his assertion that, "as a rule, members of the same group having different numbers of vertebræ *do not* inhabit the same waters." As yet no evidence has, to our knowledge, been advanced against our statement that, of closely allied fishes, those making most use of the vertebra in the column, usually the more active and predaceous species, have the larger numbers of vertebræ, and that the differences correlate with habits and use instead of temperature and selection.

Our knowledge of the life histories of the Salmones is not at all complete. Our correspondent's note bears the inference that the species *nerka* (narka, 1764, nerka, 1774, nærka, 1784) is driven to the uppermost reaches of the streams by tchavitche. It may well be that to avoid the enemy the young are placed as far out of the way as possible, but early authorities say tchavitche, in the Kamtchatkan waters, is first to go up the streams in the yearly rush. Fishing for this species "begins about the middle of *May* and lasts six weeks." Nerka "is caught about the middle of June. . . . There are two things worth notice concerning it: the first of which is, that part go before to the heads of the rivers, as if they were sent out to examine them, where some of them are caught before the shoals appear at the mouths. The second is, that this fish is more plenty in such rivers as run out of lakes than others: nor does it live long in the former, but hastens directly into the latter; in the depths of which it lies till the beginning of August, at which time it comes nearer the shore, and tries to get into these rivers that communicate with the lakes." "Each kind of fish always ascends the rivers at the same time. In the month of August sometimes two, three, nay even four species come up at once; but each keeps separate from the other. The different species of those fishes which are here called red fish shall be mentioned in giving an account of the time when they come out of the sea into the rivers; it being remarked that they always observe the same order, the same species which comes out first one year continuing to do so the following. This the Kamtschadales find to be so certain, that they call their months by the name of the fish which are then caught. The largest and best of these fish, and which come first out of the sea, are called chavitsi."

Some writers hold that this last does not feed while in fresh water.

The generally recognized rules of priority would fix the specific name *tchavitche*, instead of quinnat, on the California salmon. The former is a vernacular word, nearly rendered by the spelling given. There are several forms of the word in literature: chavitsi, tchavitche, and tchovnitche, 1764, tschawitscha, 1766, tschabitscha and tschavitscho, 1774, tshawytscha, 1784, and chouicha, 1882. Quinnat, 1836, is said to be a vulgar name for various species, and to mean shining or glittering.—ED. NATION.]

## SCIENTIFIC INDEXING.

TO THE EDITOR OF THE NATION:

SIR: In your kind notice of 'Drainage Channel and Waterway,' which I had the honor and pleasure to write, you speak of the work, in the *Nation* of July 5, page 11, as "an excellent book, with the most inadequate index that it has been our fate ever to find in any work on a technical subject." If an index of fourteen pages in agate type, two columns to the page, in a book of about 450 pages printed in small pica, containing more than two thousand references, with no subject or name omitted, is inadequate, will you kindly state what, in your opinion, would be an adequate index?

Yours very truly, G. P. BROWN.

766 WEST ADAMS STREET, CHICAGO, July 18, 1894.

[An index may be very full without being intelligently made. Our expression reflected, perhaps too strongly, our vexation at being baffled when we sought to find out about the rate of flow and volume of discharge of the new waterway, which we had seen in reading the book. Turning to the index, we found neither Velocity, Capacity, Volume, Flow, Cross-section, Depth, Width, Section, Slope, Inclination, Fall, Current, nor Channel. Discharge and Waterway were there, but with no reference to what we were in search of. We thought that such important subjects as these missing titles indicate should be traceable in an adequate index.—ED. NATION.]

## DECORUM IN BERLIN.

To the Editor of The Nation:

Sir: I beg to submit the following incident as an instance of the detail to which police authority may extend here in Berlin:

Wandering through a rather unfrequented part of the Thiergarten recently, I observed a decently clad fellow asleep on a shady bench; he was sitting sidewise, with one leg on one side and one on the other of the narrow bench, his head resting on his arm, while his arm was supported by the back of the bench. I had noticed nothing unseemly in his position, but a police officer, more observant than I, approached and felt apparently no hesitation in rousing the fellow up and directing him not to straddle the bench, but to take a proper position. The culprit quietly complied, and the big policeman walked on.

The incident is a trifling one and may go to confirm the fact that Berlin is well governed, but may it not serve as well to make us more contented with our own land? For though sometimes called on to submit to the caprice of an Irish officer "armed with a little brief authority," it is certain that the humblest of our citizens would not submit uncomplainingly to such a wanton interference with his happiness.

Very truly yours, C. G. Baldwin.

Berlin, July, 1894.

## "BACK AND FORTH."

To the Editor of The Nation:

Sir: Your learned correspondent "F. H." is probably correct in the statement that the use of the phrase "back and forth" is now confined to America, but it may be of interest to note that a precisely equivalent phrase, "back and forwards," is current in Ireland.

The Cornish "foorth and back," the Devonshire "voar an' back," and the West Somerset "back and fore," all in the sense of 'wrong end to,' are perhaps only corruptions of "fore end back" or "back end fore."

Your correspondent's interpretation of the colloquial Hibernianism "to the back of" to mean 'immediately after,' falls in naturally with the quotation cited, viz.: "He made her drink a bumper, and another to the back of it." This meaning, however, does not seem to accord with general usage, for in the above phrase, as commonly heard in Ireland, the word "back" has its ordinary meaning of *support* or *reinforcement*, as in the sentence: "I am not afraid of Johnny, nor his big brother to the back of him." J. M.

Ithaca, N. Y., July 30, 1894.

To the Editor of The Nation:

Sir: The dialect illustrations under the above head in your issue of the 26th inst. seem to me to change the obvious meaning of the speaker in both cases by giving "and" where "end" was used. What I venture to think the woman said was, "'Ee 'ave 'is 'at on foorth eand back"; and did not the miner say, "I gnawed they pump wud na run fur 'ee 'ad they rockers in foorth eand back"?

Very respectfully, J. G. C.

July 30, 1894.

To the Editor of The Nation:

Sir: "Back and forth" is given in Webster in the sense of to and fro. It may not appear in literature, but it has been used in all parts of New England for a hundred and fifty years, and undoubtedly longer—so generally that it could not have originated there. "Walking back and forth for a long time," "going back and forth continually," are common examples. In a letter of my great-grandfather, in 1760, I read: "Indians went back and forth [from New Hampshire]." Sometimes the phrase was varied by "forward and back," as "passing forward and back every day." P. J. F.

Clinton, Iowa, July 28, 1894.

# Notes.

It must have seemed as if the English-speaking world was already in a fair way to be satisfied with dictionaries of the language, but still another has just been set on foot and makes an appeal for subscribers. 'The National Dictionary of English Language and Literature,' it will be called, and its aim is "to include all words and phrase-words found in English literature between 1360 A. D. and the present day," with the expectation of embracing "a large number of words of good authority or of common speech never before registered in any dictionary." It is to be "based on full indexes of several carefully selected authors, including Chaucer, Caxton, Elyot, North, Phil. Holland, Bacon, Pope, Johnson, Burke, Thackeray, Macaulay, and Ruskin." Date of authorship and exact references will accompany every quotation, as in the 'New English Dictionary.' The editor, Dr. C. A. M. Fennell, Barton Cottage, Cambridge, England, is but two years free from the great labor of the 'Stanford Dictionary of Anglicised Words and Phrases'—a work more apart from existing dictionaries than his new venture can be, but also less popular in character. The 'National Dictionary' will make three volumes at three guineas, if paid for in advance during the current year. Subscriptions should be sent to the editor.

Charles Scribner's Sons will shortly launch a subscription book, 'The Woman's Book,' consisting of chapters interesting to the sex contributed by many well-known writers, both male and female. There will be more than four hundred illustrations. The same firm have in press a new story, 'Marsena,' by Harold Frederic.

'A Story of Courage: Annals of the Georgetown Convent of the Visitation,' by George Parsons Lathrop, will be published by Houghton, Mifflin & Co.

Little, Brown & Co. will bring out 'Curb, Snaffle and Spur,' training for young men for the cavalry service, by Edward L. Anderson.

A new translation of Molière's works, by Miss K. P. Wormeley, the translator of Balzac, will bear the imprint of Roberts Bros.

T. Y. Crowell & Co. have issued 'The Footprints of the Jesuits,' by R. W. Thompson, ex-Secretary of the Navy.

Ginn & Co. will soon have ready 'Citizenship: A Book for Classes in Government,' by Julius H. Seelye, D.D., late President of Amherst College.

William Briggs, Toronto, has in preparation a book of verse, 'My Lattice,' by Frederic George Scott, a Canadian poet.

Wilson Nevens, Falmouth, Me., invites subscriptions to a genealogical record of the Nevens or Nevins families of New England, including those of Palmer and Gloucester, Mass., and of Pelham and Hollis, N. H.

'Quentin Durward,' in two volumes, is the latest of the Waverley Novels in the International Limited Edition (Boston: Estes & Lauriat; New York: Bryan, Taylor & Co.). Mr. Lang's task as preface-writer has visibly begun to pall upon him, and he has little to say except to rate 'Quentin Durward' with the very best work of Scott, and to supply some bibliographical and historical data. M. Lalauze furnishes the etched illustrations, with his usual academic grace and correctness.

Two more volumes have been added also to the Dent-Macmillan pocket "Temple Shakspere," viz., 'Love's Labour's Lost' and 'Much Ado about Nothing.' There is a charm about this series which bears prolonging.

The changes in the island of Nantucket have not been so great since 1882 that Mr. Edward K. Godfrey's "complete index and guide to this noted resort," just reissued by Lee & Shepard, Boston, is seriously out of date. The interval of time, however, might well have been improved in providing a table of contents and perfecting the index. There is much history and natural history in this volume, which is furnished with maps of the island and the town.

Two more numbers of the series "Artistes Célèbres" (Paris: Librairie de *l'Art*) are before us. That on 'Michiel van Mierevelt et son Gendre [Willem Jacobsz Delff],' by Henry Havard, is needlessly diffuse, and does relatively little to draw Mierevelt out of his "penumbra," by supplying fresh data from original research. Still, something has been done in this line, and there is a large series of examples of the work of this prolific portraitist, most of them engraved by his son-in-law Delff. Adrien Moureau's 'Antonio Canal, dit le Canaletto,' is equally expanded. A third of the hundred pages is given up to a preliminary sketch of Venetian life in the eighteenth century; a quarter describes the various phases of Venice embalmed in Canaletto's pictures; a sixth (the fourth and last chapter) deals with Canaletto's pupils and imitators; another sixth discusses his merits as painter and engraver; and the remaining twelve pages more than suffice to tell all that is known about his uneventful career. In short, the text seems designed chiefly to keep the full-page plates from crowding each other. They occupy on the average every other page, and give its principal value to the volume. The majority are from engravings after Canaletto's canvases, but there is a good sprinkling of his own skilful etchings, and one unpublished wash drawing. These examples, except the last, have been drawn from the National Library.

Prof. Rudolf Koegel, whose 'Althoch- und Altniederdeutsche Litteratur' forms one of the most valuable sections of the "Grundriss der Germanischen Philologie," has just published the first volume of a 'Geschichte der Deutschen Litteratur bis zum Ausgange des Mittelalters' (Strassburg: Trübner). It is safe to say that this compendium is destined to be the worthy successor of the works of Koberstein and Wachernagel. The present volume goes as far as the middle of the Karolingian epoch, and deals in a most comprehensive manner with the nature and development of ancient Germanic verse and prose. In contradistinction from Johann Kelle, with whose 'Geschichte der Deutschen Litteratur bis zur Mitte des elften Jahrhunderts' this volume in part coincides, Koegel does not confine himself to a consideration of the few literary fragments which have come down to our time, but tries also by a careful analysis of historical testimonies, by a searching study of archaic remnants in later literature, and through analogies with the literary development of other Germanic tribes, to reconstruct the earliest oral tradition of the German people. He succeeds in shedding light upon many doubtful

points, especially in the history of the oldest hymnic poetry and of alliterative verse; and he presents, all things considered, the most complete picture of German literary origins which as yet has been given.

It is a rather discouraging sign of the times that the volume recently published by Dr. M. Felix Korum, Bishop of Trier, and entitled 'Wunder und Göttliche Gnadenerweise bei der Ausstellung des Heiligen Rockes zu Trier im Jahre 1891,' should have already passed into a fourth edition. The bishop does not wish his statements to be accepted on his own authority, but claims to give an "aktenmässige Darstellung," or documentary presentation, of the miracles wrought by the holy coat of Trier in 1891, and thus invests them with a seemingly scientific character. It is hardly necessary to add that these certificates, issued by obscure curates and country doctors, or by an episcopal commission of theologians and physicians, who have very strangely forgotten to sign their names to their reports, have no evidentiary value whatever. The diseases said to have been healed were nervous and hysterical affections, St. Vitus's dance, and a few cases of certain mild forms of lupus and tabes, which, as is well known, often disappear for months and even for years without the aid of medicine or miracles.

Dr. Korum has also published a pastoral letter denying the genuineness of the "holy seamless coat" of Argenteuil, and inviting the faithful to pay their devotions only to the "holy coat" of Trier. The same conclusion was reached by a French Benedictine Abbé Vonel, whose pamphlet threatened to produce in Argenteuil a serious depression of spirits and of trade, especially among the innkeepers, and was immediately suppressed by order of Monseigneur Richard, Archbishop of Paris. On the other hand, the ecclesiastical authorities of Argenteuil do not deny the genuineness of the relic at Trier, but only assert that it is an upper garment, whereas theirs is an under garment worn next to the skin, and therefore endowed with greater healing virtue than could possibly be possessed by a mere overcoat. The masses, however, seem to be scarcely affected by these mutual accusations and recriminations. This is the year for the "elevation" of the rival relic at Argenteuil, the gift of the Byzantine Empress Irene to Charlemagne, and already 500,000 pilgrims have flocked to the little town on the Seine where Héloïse took the veil after her separation from Abélard; and no one doubts that scores of miraculous cures will be recorded and in due time officially reported.

M. George Cogordan's 'Joseph de Maistre' is the latest issue in Hachette's "Les Grands Écrivains Français," and it is quite worthy of the volumes which have preceded it. The subject of the biography is a man whose influence on French thought has been larger than is commonly supposed, and it is this point which comes out clearly in M. Cogordan's work. An opponent of Rousseau, a corrector of Voltaire, a more serious Christian than Chateaubriand, De Maistre held views which events justified and proclaimed beliefs which have proved groundless. He believed Washington would never be built, for instance, and that Congress would never meet there; he was mistaken also in predicting the early disappearance of Protestantism; but he enunciated many sound political views which, at the time, were scouted, and which have triumphed since. M. Cogordan has been particularly happy in reproducing the living personality of De Maistre, with its many noble traits, and in analyzing his doctrines.

Prosper Mérimée forms the subject of a most readable and thoroughly interesting volume by M. Augustin Filon (Paris: Hachette & Cie.). M. Filon was fortunate enough to know the great writer personally and to be somewhat intimate with several of Mérimée's closest friends. Many letters, of a confidential character, have been intrusted to him, and these various materials have enabled him to give his readers a very living portrait of the author of 'Carmen' and 'Colomba.' M. Filon remains convinced that while it is possible that Mérimée's scepticism may have been partly assumed as far as love is concerned, it was absolute and sincere in all other respects, "standing upright his life long on the narrow and giddy crest of absolute negation," with, as he died, a "perhaps" breathed instead of the usual "no." A very valuable part of the book is the complete and accurate bibliography of Mérimée's works prepared by that eminent authority, the Viscount de Spoelberch de Louvenjol, which is published here for the first time.

The *American Journal of Insanity*, published quarterly for half a century at Utica, N. Y., has been purchased and will hereafter be published by the American Medico-Psychological Association of Chicago. Dr. Richard Dewey becomes the temporary editor.

The *Scottish Geographical Magazine* for July contains two valuable, though technical, articles on the mountain systems of Central Asia, by Mr. E. Delmar Morgan, and a continuation of Otto Pettersson's review of Swedish hydrographic research in the Baltic and North Seas. In this part he treats of the Baltic current in the Skagerack and North Sea, the salinity of its waters, its temperature at different seasons, and the meteorological consequences, all of which are illustrated by a series of colored plates. These are followed by a second instalment of Mr. D. R. Urquhart's entertaining notes on the Bolivian Altiplanicie or highlands, mostly devoted to an account of the inhabitants, whom he divides into the Bolivians, who are of Spanish descent, the Cholos or half-breeds, and the Indians. These last are apparently the most hopeless of the three, being "mirthless, abject, spiritless creatures, whose only idea of recreation or pleasure is in drunken orgies of the most disgusting nature." Although a very healthy race, with great powers of endurance, which, the writer suggests, may be partly owing to their continual coca-chewing, and though many of them are very long-lived, he believes that, "as this Indian is really incapable of improvement, he will probably shortly disappear." They are all Roman Catholics, and, if the example given is typical of the class, their priests guide them with a cudgel.

If a thorough equipment can insure success, the Jackson-Harmsworth Polar Expedition, which started from England on July 11, will be successful. It consisted of eight men, all carefully chosen for some special qualification—as, an astronomer, surveyor, photographer, steward, and doctor. While game is abundant in Franz Josef Land, their theatre of operations, they have taken provisions to last four years on full rations, together with a large stock of methylated spirit for fuel and light. A novel feature is an aluminium boat, 18 feet by 5 feet, in three sections, and capable of holding 13 to 20 persons, but weighing only 150 pounds. There are also other boats and eighteen sledges, of extraordinary strength and lightness, and capable each of carrying 1,600 pounds, to be drawn by dogs and Siberian ponies—another novel feature in arctic exploration. We have already described Mr. Jackson's plans, and will only add here that he expects to be gone three years. The total cost of the expedition, borne by Mr. Harmsworth, will be about $100,000.

*Die Grenzboten*, a weekly periodical published by Grunow at Leipzig, contains in the number for July 12 some sharp and quite significant remarks on "Beamtenbeleidigung," in which the writer animadverts on the growing tendency of imperial prosecuting attorneys to shield Government officials from public criticism by rendering such censure a punishable offence, and thus creating a *delictum sui generis* hitherto unknown to the statutes of the realm. An insult offered to the Emperor or to any of the confederated sovereigns is recognized by the criminal code of the German Empire as "Majestätsbeleidigung," or lese-majesty; and the frequency, and in many cases the frivolity, with which in late years prosecutions have been instituted under this clause, and the gross abuse of the legal protection properly granted to the dignity of rulers, have given rise to much injurious comment and provoked bitter feeling even in the minds of loyal subjects and good citizens, who are instinctively inclined to show due respect to "the powers that be." The consciousness of their official importance, and the habit of exercising absolute authority over submissive and often servile subalterns, have now excited in the higher class of public functionaries in Germany the desire to have a like protection extended to themselves, especially as regards strictures emanating from the press. Hence the attempt to revive the obsolete distinctions between grand and petit as formerly applied to treason and larceny, and thus to establish a new delict known as "kleine Majestätsbeleidigung," or petit lese-majesty, for the safeguard of all servants of the state.

The latest news from the explorations at Hissarlik (*Levant Herald* July 7) comes to us from the owner of the site, Mr. Frank Calvert, United States consul, Dardanelles. It was readily seen that the second, or burned city which Dr. Schliemann enthusiastically assumed to be the city of Priam, instead of solving the question of the 'Iliad,' offered new problems to the archæologist. The precious objects and the works of art there found were evidently ruder and more ancient by some centuries than those of Mycenæ, and therefore decidedly earlier than Homeric Troy. In the sixth city, however, pottery of a Mycenæan type was discovered, and this led Dr. Dörpfeld, assisted by Mrs. Schliemann, and later by the German Government, to extend excavations on this level, with results that are now proving fruitful, and that may possibly be conclusive. Curiously enough, Dr. Schliemann's excavations obscured rather than aided this particular investigation. The area of the sixth city was twice as great as the space covered by the successive acropolises of the other five; and, in consequence, their débris was dumped on the very spot which Dr. Dörpfeld has just been clearing. The massive walls he has uncovered, from five to six metres broad, the lofty towers, and the street which has been traced, may provisionally be assumed to belong to the Homeric Troy.

Mr. W. I. Fletcher writes to us from Amherst: "I am in receipt of a private letter from Mr. M. Foster, Secretary of the Royal Society, in which, referring to a subject-index to the Catalogue of Scientific Papers, he says: 'I have now to inform you that the Royal Society has determined to publish such a subject-index, and that it is already proceeding to

put the matter in hand.' I am sure this news will be hailed with delight throughout the United States."

We have received from the Skandinavisk Antiquariat at Copenhagen, 49 Gothersgade, a catalogue of Icelandic and Scandinavian works of exceptional rarity or excellence, pertaining to the languages, literature, history, topography, etc., of the countries in question. It represents more than the stock in hand, and has therefore a bibliographical value.

—In *Harper's* for August "Trilby" comes to an end, and so does Mr. Howells's account of his first visit to New England. He gives a report of his interviews with Hawthorne, Thoreau, and Emerson, and mentions that, when Poe was spoken of, Emerson said: "Oh, you mean the jingle-man?" Owen Wister's story, "The Serenade at Siskiyou," is noteworthy because it presents a timely satire on the mushy sentimentalism which sympathizes with riotous strikers. Of the remaining fiction there is not much to be said. Richard Harding Davis tells what he assures us is a true story, and one would rather take his word for it than suppose so clever a writer capable of inventing anything so inane. Mr. Smalley narrates some of his experiences as a war correspondent, and says that during the battle of Antietam an officer on Gen. McClellan's staff requested him to see Gen. Hooker (who had been wounded), "find out whether he can mount his horse, and, if he can, ask him whether he will take command of this army and drive Lee into the Potomac or force him to surrender." "Up the Norway Coast," by George C. Pease, contains some useful information for travellers in that region, not the least attractive item being to the effect that the mean temperature in July is 56°. Mr. Julian Ralph's article on "Old Monmouth" might serve to point a moral on the literary shortcomings of much of our magazine literature. It starts very well with much interesting historical lore concerning Monmouth County, N. J., then veers off into a pretty enough celebration of the fish-hawks of the region, and winds up with a reprint of the Asbury Park bathing regulations. It surely is not exorbitant to ask that in an article of only fifteen pages, of which nearly one-third is taken up with illustrations, there should be a little more unity of treatment. Even the illustrations do not refer to anything in the text; however, the frontispiece, engraved by Victor Bernstrom after a study from nature by himself, may be enjoyed as confirming the feeling for the picturesque and the technical skill already displayed by the same artist on a larger scale in depicting the same Shark River.

—The *Century* opens with an article on "Washington as a Spectacle" which would at once be recognized as being by Mr. Marion Crawford even if his name were not signed to it. It is pleasant to observe that his style gains in force and dignity. When he says, "For the French mind differentiates keenly, but integrates by one rule only, which is the Parisian," it would be some satisfaction to have an explanation of the Parisian rule for integrating. The most attractive piece of fiction is Mrs. Mary Hallock Foote's "Maverick," a masculine, tragic story. There is an instructive description of "The Coleman Collection of Antique Glass," by Russell Sturgis, and a fine engraving by Cole from Quentin Matsys, in his series of the "The Old Dutch Masters." In the fourth instalment of "Across Asia on a Bicycle" it is stated that one method of sweetening tea in use among the Russians is "to hang a lump [of sugar] in the midst of a tea-drinking circle, to be swung around for each in turn to touch with his tongue, and then to take a swallow of tea." The singularity about this is that Diedrich Knickerbocker reports the same custom as being in vogue in the town of New Amsterdam. A discussion in which Senator Hoar advocates Woman Suffrage while Dr. J. M. Buckley opposes it, pretty nearly exhausts the subject without settling it. Perhaps the most important article, from a purely literary point of view, is that on "Poe in the South," consisting of selections from Poe's correspondence edited by Prof. Geo. E. Woodberry. The letters here printed form part of a collection of papers which will appear in book form under the editorship of Wm. M. Griswold, a son of the Rev. Rufus Wilmot Griswold, whose biography of Poe was the occasion of a heated and acrimonious controversy nearly forty years ago. Prof. Woodberry vindicates Dr. Griswold from the aspersions of his critics, and confirms his judgment of Poe; but the letters need more explanation to show their full bearing on Poe's biography.

—In *Scribner's* Prof. Woodberry prints, with comments, a number of letters written by Lowell to Poe in 1842-'44, also forming a portion of the Griswold papers. They contain matter of biographical and literary interest, throwing more light, however, on Lowell than on Poe. Poe's letters are not included, having appeared in Woodberry's Life of Poe. A letter of Robert Carter to Poe bears witness to Lowell's rapidity of composition, mentioning that he had written a poem of 400 lines in seven or eight hours. In one letter Lowell advises Poe (who was about to edit a magazine which was projected, but came to nothing) to "be very watchful of your publishers and agents. They must be driven as men drive swine—take your eyes off them for an instant and they bolt between your legs and leave you in the mire." Mr. Bunner's story, "French for a Fortnight," is adroitly managed so that just as the reader is about to ask impatiently when the story is going to begin, he finds himself stumbling over the end of it. M. Octave Uzanne carries out quite consistently the somewhat obvious fantasy that books will in time be superseded by the phonograph and illustrations by the kinetograph, of which he says he saw "the first trial at Orange Park, New Jersey." Mention should be made also of Mr. W. B. Closson's fine engraving of Carolus Duran's "The Poet with the Mandolin."

—The *Atlantic* contains the final instalment of Sidney Lanier's letters to Mr. Peacock. They are pathetic for their revelation of the poet's struggles with consumption and poverty, and of the gentle patience with which he bore his many burdens. He was a reluctant and an unsuccessful applicant for a Government position under the Hayes Administration, and was casting about for a place in the Johns Hopkins University or in the Peabody Library in Baltimore, all in the hope of obtaining a more secure livelihood than was afforded him by magazine articles and by his engagement as first flute in the Peabody orchestra. In a letter written in November, 1878, he outlines a scheme for systematic courses of lectures to serve as "Schools for Grown People," which have a vague resemblance to the Chautauqua system. Under the title of "The College Graduate and Public Life," Theodore Roosevelt indulges in a criticism of the critics similar to that expressed by Senator Lodge in his recent Phi Beta Kappa address at Harvard. It seems hardly probable, however, that he will persuade the critics to lay down the pen and take up the sword. He might as well try to convert a razor into a carving-knife. Another obvious consideration is that the actors on any stage must always be outnumbered by the audience, and that a good actor will always prefer a critical audience. Mr. A. H. Washburn's article on "Our Consular Service" is a very useful piece of criticism, and evidently the work of an expert. "Professional Horsemen," by H. C. Merwin, is a little out of the ordinary run of magazine articles, but very readable and touched with humor.

—Nowhere else than in Old England could such a book as Prof. G. G. Ramsay's 'Latin Prose Versions' (Oxford: Clarendon Press; New York: Macmillan) have got itself published. It is a small quarto beautifully printed on the largest of paper, bound in half vellum, and deckle-edged with gilt top; there being only 300 copies, of which but 220 are offered for sale. And the contents of all this magnificence are Latin versions, 150 of them, turned by 30 eminent Englishmen from well-known English writers. Among the contributors are the Archbishop of Canterbury (who "does" a page from Grote), Profs. Butcher, Conington, Robinson Ellis, Nettleship, and Postgate, and Drs. Merry, Sidgwick, Sandys, Reid, and the editor himself. The English authors from whom the selections are made include Shakspere, Burke, Addison, Lord Chesterfield, Cromwell, Darwin, Mill, Froude, Gibbon, Macaulay, Raleigh, Scott, and Thackeray. Classical teachers everywhere will agree with Prof. Ramsay that the practice of Latin composition supplies them with their most effective method for teaching clearness of thought and purity of style; and it is only to be regretted that the price of this book and the limited number of copies put it out of the reach of those to whom it would do the most good. A cheaper edition would be a real boon to school and college-teachers throughout this country, where indeed the interest in Latin composition, of late years dulled, seems now to be reviving. The versions are in general very well done and will repay careful thought and study. Many of them have the true classic ring, and only now and then do we meet what reminds us of Dr. Johnson's definition—"*Latin:* an exercise practised by schoolboys who turn English into Latin."

—Our Paris correspondent last week attributed, no doubt correctly, to Proudhon the invention of the *doctrinal* meaning of the word Anarchy. Littré's earliest quotation for the word in its abstract sense is from Bossuet in the last third of the seventeenth century. Dr. Murray's earliest quotation is from Taverner's translation (1539) of Erasmus's 'Adagia'; "This unleful lyberty or lycence of the multytude is called an Anarchie," and it is extremely probable that Erasmus (about the year 1500) gave to the word its modern currency. "The populace is plotting anarchy," he says in one of his 'Colloquies' (1522) ("Puerpera"); and from a marginal gloss in editions so late as Amsterdam 1662 and Basel 1683 ("*Anarchia*, cum nullo principe tumultuatur populus"), it clearly appears that the word was a Latin neologism. In the Leyden edition (1703) of the 'Opera Omnia,' "ex recensione Johannis clerici," this gloss is dropped, presumably for the reason given in the preface to volume i., that the 'Colloquies' had been disfigured with a lot of silly, false, puerile, or superfluous patches, which the editor felt in

duty bound to remove—in order to make room for his own "multò uberiores Notæ." In other words, Anarchy by that time needed no explanation for any scholar of the Greek, and probably it was familiar enough in the vernacular of all the western European languages. Dr. Murray shows that Bacon used it as an ordinary word in 1605. There must be other instances in which the 'New English Dictionary,' by its historical examples, furnishes a clue to the origin of words in Continental languages also.

## HITTELL'S MENTAL GROWTH OF MANKIND.—I.

*A History of the Mental Growth of Mankind in Ancient Times.* By John S. Hittell. 4 vols. Henry Holt & Co. 1893.

In these days of monographs and encyclopædias he is a bold man who undertakes in a single book to give a connected history of the mental growth of mankind in ancient times, and who means to "follow up this book with other volumes, in which the course of human progress [shall] be traced down to the present day." It will be seen that Mr. Hittell has come very near selecting the universe as his specialty. He is aware of the magnitude of his task. In his preface he gives a list of questions which the historian of culture should answer. These fill five pages, and range from, "Were the first men black, yellow, or white?" to "Has the Celt any natural fitness for free government?" and from "Was dress first used for ornament, for comfort, or for the gratification of modesty?" to "Is our moral code the product of intuitive perception, or of experience guided by reason?" With becoming modesty, he expresses the hope that his own answers to these questions, if not successful, may at least serve as stepping-stones to better solutions by-and-by.

Writing not for scholars, but for the public, Mr. Hittell is obviously held to four main requirements: simplicity of plan, a controlled abundance of interesting details, accuracy, and a lively style. He must consult the best authorities, but he is not bound to get all his materials at first hand, or to enlarge the domain of science. His business is to codify, to expound, and, meanwhile, to keep his readers awake. One of these requirements the author satisfies fully. He is seldom dull. He has read widely, he has considerable mental alertness, and he knows what will interest his audience. We may open any one of his volumes almost anywhere and be pretty sure of finding entertainment. His style, though not brilliant or always correct, is usually clear and straightforward, and has some vigor. We have observed but one instance in which his Pegasus has run quite away with him, and that is the peroration of his remarks on the uses of evil. We have space for only the closing words, which are to the effect that "material, moral, and intellectual progress, arm in arm with their congenial associate, general enjoyment, shall continue their glorious triumphal march, with speed increasing in geometrical ratio, so long as mankind shall exist." We venture to suggest that so swift an acceleration of a triumphal march would endanger its dignity.

Mr. Hittell divides culture into three grades, which he calls "culturesteps" (a hideous adaptation of *Kulturstufen*): savagism (another unpleasant word), barbarism, and civilization. "Barbarism," we are told, "is the condition of the Aztecs, Quichuans, ancient Egyptians, Phœnicians, Carthaginians, Persians, and Hindoos, the Chinese and the Mohammedan nations. They have cities and natural government, but lack a high intellectual life. Civilization is limited to the ancient Greeks and Romans and the modern Christian nations." This classification denies a high intellectual life to the authors of much respectable literature, including the Hebrew Scriptures, which Mr. Hittell himself calls "the most wonderful of books." It also puts the Aztecs and Quichuans into the same category with the Phœnicians and the Indo-Iranians. So weak an attempt at defining "culturesteps" as this does not encourage the reader to expect much method in the treatise that is to follow. And, indeed, this feebleness of grasp on important historical generalizations is a defect that defeats the whole purpose of the book. The historian of culture has to accumulate details, and to estimate, on the basis of these details, the degree of civilization which this or that people has attained. In this part of his task Mr. Hittell has not been uniformly successful, though his estimates are commonly not far astray. But the historian of culture has another and a far more difficult duty. He must define with clearness the contributions made to progress by various nations. He must explain the relations of nation to nation and of race to race so far as these relations have affected culture. He must grapple with problems of race-mixture, of migration not merely of races but of institutions, of the absorption of lesser civilizations by greater, of the lending and the borrowing of languages. And throughout these discussions he must never lose sight of his main purpose—to describe the progress of the human race and not merely of its parts. The great nations that have passed the torch on must be studied not merely for themselves or even as typical of different stages of social advancement, but as active, if unconscious, promoters of general enlightenment. Peoples which, like the Aztecs, have for any reason exerted no influence on the world at large, may be studied as types, no doubt, but must not be so treated as to interfere with the main plan of presentation.

Mr. Hittell would of course agree with all this; indeed, he expresses himself to much the same effect. But his control over details is not firm enough to enable him to keep these general principles always in mind, and his constructive skill is inadequate to the execution of so large and complicated a literary task. His "history" is, therefore, rather a collection of essays or cyclopædia articles than a unified work. The chapters that should introduce, sum up, connect, generalize, are scrappy and insufficient at best, and are sometimes left out altogether.

In the first volume, which deals with savage life, this fault, though not so conspicuous as it becomes later, is visible enough. The prefatory chapter treats of "Man's Antiquity," his "Simian Relations" (a trifle ambiguous!), and so on, very briefly, but it may serve well enough as an introduction. There follow interesting chapters on Ethnology, Industry, Social and Intellectual Life, Polity, Military System, and Religion, in which these matters are illustrated with an abundance of facts; but when it becomes necessary to give the results of the whole investigation, the author leaves us in the lurch. The summary at the end of the volume is both incomplete and rambling. It occupies but nineteen pages, and the titles of three consecutive divisions—"Departmental Relations," "Queer Customs," "Benefits of War"—indicate its discursive character. A similar fault shows itself in some of the preceding chapters. That on savage religion, for example, does not contain a clear statement of any theory of religious development except that which Mr. Hittell happens to hold, and even this is somewhat obscured by details. The discussion of marriage is similarly unsatisfactory.

In the second volume—"Heathen Barbarism"—the weakness just adverted to becomes marked, and its results are confusing and misleading to the last degree. The first chapter is entitled "Bronze." It consists of three sections: "Barbarism," "Bronze Tools," and "Superiority of Iron." The main points as to the connection between barbarism and bronze are given, but the reader must get at the significance of the facts as best he can. The chapters that follow show some curious ideas of proportion. To the Aztecs 42 pages of text are given; to the Quichuans, 28; to the Chinese, 42; to the Japanese, 5; to the Egyptians, 61; to the Celts, 10; to the Teutons and Etruscans, 5 each. These figures are eloquent. Mr. Hittell does not contend that either Aztec or Quichuan culture has had any effect on the progress of mankind; yet he gives to these two tribes together more than three times the space allotted to the Teutons, Celts, and Etruscans. He seems himself to suspect that there is something wrong in this. After dismissing the Teutons with their beggarly dole of pages, he remarks, apologetically: "This may seem a brief account of an ethnological family which unquestionably occupies the first place in the history of culture . . . ; but it must be remembered that not until after the Teutons had been brought under the influence of Rome did they show their great capacities and begin to exert a strong influence on other nationalities. Their glories belong to a later period." This is not to the point. We do not want a discussion of the glories of the Teutonic race. That may be deferred to one of the forthcoming works with which Mr. Hittell threatens us in his preface. What we require is an account of the culture and the religion of the ancient Germans that shall indicate what manner of men they were.

One may ask, too, when the Germans first came into contact with the Romans. Was it later than the time of the Conquest of Peru or the Conquest of Mexico? But the chronological limits of this second volume are hard to survey. The author actually defies time when, in the closing chapter, he remarks that "although we have studied the Chinese, Japanese, Aztecs, and Quichuans, who belong wholly or largely to modern times, and have considered the Celts and Teutons, who became prominent about the beginning of the Christian era, and have not yet taken up the Jews and Greeks, whose activity dates back to a period before the rise of Persia; yet, notwithstanding these inequalities in the chronological lines, the general story of human progress has now been brought down to 500 B. C." We must confess our inability to follow the turns and twists of a method like this. The real reason for the scant measure dealt to our Germanic ancestors we think we have discovered by a search in the notes and bibliography appended to the volume. The notes substitute for citations the significant remark: "In reference to the ancient Teutons, there is no one authority of superior comprehensiveness and accuracy." The bibliography contains the titles of no works on the subject except Prof. Anderson's 'Norse Mythology' and Mr. Du Chaillu's 'Viking Age.' Even so accessible a book as Prof. Gummere's excellent 'Germanic Origins' has escaped the notice of our historian of culture.

Another "feature" of this curious second volume is the section on the Primitive Aryans. This occupies (if one counts the notes) just four pages, and two of these are taken up by quotations from Max Müller's 'Chips.' The amateur of statistics might find amusement in instituting a few comparisons. We shall content ourselves with setting over against these four pages the five pages devoted to the "aggressive [foreign] policy" of the Quichuans. Again Mr. Hittell's notes and bibliography betray him. He knows nothing of Schrader, old edition or new. To him the Aryan migration is a migration of tribes, in all cases, never a "migration of culture." He has no inkling of the complicated questions, vitally important to the historian of civilization, which surround this whole matter. Fifty pages would have been none too many to give to the primitive Aryans, and the reader is put off with four. The defects of Mr. Hittell's method are again exemplified in the chapters on the Egyptians, the Ancient Indians, and the Persians. The space assigned to these peoples is sufficient, but the discussion of connections and interrelations is scanty. Thus, out of sixty pages on the Egyptians, but two pages are given to "Egypt's place" in the history of civilization. Again, in the chapter on the Hindus, one of the most important questions in comparative literature is dismissed with the unilluminating dictum: "'The Arabian Nights' and 'Æsop's Fables' are copied from the ancient books of the Hindu."

## ALLEN'S UNITARIAN MOVEMENT.

*An Historical Sketch of the Unitarian Movement since the Reformation.* [American Church History.] By Joseph Henry Allen, D.D., late Lecturer in Ecclesiastical History in Harvard University; Honorary Member of the Supreme Consistory of Transylvania. New York: The Christian Literature Co. 1894.

If the series of American Church Histories, of which this volume is the first instalment, is kept up to the level of Dr. Allen's 'Sketch,' it will be an extremely valuable addition to our present stock of careful information. Such a consummation, however devoutly to be wished, we hardly dare expect, for Dr. Allen was, by birth, experience, and culture, peculiarly well fitted for his task. One of a long line of clergymen exceptionally strong in Harvard names; the grandson of the elder Ware, whose election to the Hollis professorship in 1805 marked the accession of Harvard to the Unitarian movement; the son of a Unitarian minister, settled for life in Northboro', Mass., who was a typical representative of all the humbler virtues and fidelities of the New England country clergyman; a scholar second to no other in the Unitarian body, and one whose specialty has been the study of this body's origin and growth, loving its traditions, and devoted to its great names and high examples, while illustrating in himself the utmost freedom of its intellectual development—so qualified and conditioned, Dr. Allen possessed extraordinary fitness for the work of which the volume now before us is the ripe and pleasant fruit. In and between the lines one reads of the most liberal knowledge of the subject and the most careful special preparation. In the expression of his opinions and in his characterization of persons and events, the writer steadily observes the rule of naught in overplus. He brings a tempered admiration to the depiction of the men who, like Hedge and Bellows, have impressed him most. In no respect does his book differ so widely from the ordinary church history as in the entire absence of all extravagant laudation, all "booming" of his special cause. If we are not mistaken, many of his Unitarian friends will wish that his tone had been less disengaged, and many of his more orthodox readers will wonder that it could be so to such a remarkable degree. The action goes on without a chorus from the beginning to the end, and we are not disposed to question the wisdom of this arrangement.

> "Pleads for itself the fact,
> As unrepentant Nature leaves her every act."

It is certain that Dr. Allen has set down naught in malice, it is equally certain that he has extenuated nothing in his history.

The first chapter, which treats of the reformers Valdés and Ochino and related matters, suffers from the scarcity of our knowledge and the vagueness of the first tentative departures from the theology of Rome, with which Luther had no quarrel save in the one particular of salvation by faith alone. Evidently there was in the sixteenth century a great variety of departures from the orthodox standard, some of which, without the severe repression of both Catholics and Protestants, might have become vigorous growths.

In his second chapter Dr. Allen confines himself to Servetus, with whom he deals much more sympathetically than with the Socini, especially the younger, in the chapter following. This is because Servetus had more of the free intellect, less of the dry, thin, rationalizing temper of the Socinian founders. There is no exaggeration of the circumstances of Servetus's death nor undue emphasis upon them. Calvin's action received wide Protestant endorsement. He would have had Servetus beheaded. But evidently his death was determined, as it was threatened, in advance of the trial, and Calvin did his best to make the Roman Inquisition do his dreadful work. Very grim is the humor of his 'Refutation' of Servetus after his death, where he writes how he had hoped that his errors "would soon vanish of themselves in smoke." To the criticism of the Bible, Servetus brought an intelligence that was remarkable for his time. His insistence that the Old Testament predictions dealt with immediate events went nigh to anticipate the views of Dr. Noyes in 1834, for which a prosecution was threatened. His departure from the orthodox doctrine of the Trinity has never met with favor among Unitarians. It was of that Sabellian type, panoplied in which Moses Stuart of Andover went forth to war against the Unitarians of Channing's time, and whose vaguer adumbrations are sufficient to sustain the consciousness of orthodoxy among the "progressive orthodox" of our own day. Servetus shared the Anabaptist distrust of infant baptism as something magical in its operation, and nothing will more commend him to the modern heart than the wonderfully tender prayer concerning children which Dr. Allen quotes (p. 44). Contemporary Calvinists will find no fault with Dr. Allen's treatment of Calvin. We have something very like an apology for his conduct in the plea that tolerance of Servetus might have jeoparded the Reformation's hard-won liberties.

Coming to the Socini, Lælius and Faustus, the uncle (Lælius) has for Dr. Allen, as for Dr. Alexander Gordon, the most careful English student on these lines, the more attractive personality. His temper was more sceptical than dogmatic, and he had nothing of the constructive temper of his nephew Faustus, who was twenty-three years old when his uncle died, in 1562. What the nephew essayed was to bring the whole system of orthodox dogma into comparison with the New Testament, and build up a system over against that of Calvin, which should have chapter and verse, without traditional corruption, wherewith to support itself. A career of singular nobility does not atone with Dr. Allen for the dryness of his intellect, his lack of emotional ardor, spiritual fire. (To the early Socinians generally Dr. Allen brings the same distrust, which does not seem in perfect keeping with his well-considered admiration of the "Racovian Catechism" (1605), the best expression of their own and their leader's thought.) His relations with Francis David, the Transylvanian Unitarian, cast the deepest shadow on his fame. These Dr. Allen passes over too lightly. Socinus insisted on the worship of Jesus *as* God, because, while he was truly man, God had given him "a name above all names" in recognition of his glorious life and death. David would worship God alone, and consequently he was thrown into a dungeon, in which he shortly died. Socinus was summoned from Poland, by the wretched Blandrata, who was a conspicuous Socinian, both in Poland and Transylvania, to take part in the affair. His part is not clear; but the whole miserable business is one for Unitarians to remember when they are disposed to deal severely with Calvin's treatment of Servetus.

The subject of Dr. Allen's fourth chapter is the heroic martyr age of Polish Unitarianism. (The name first appears in 1568.) That the Unitarian college at Rakow had, at one time, about one thousand pupils, is one sign of many of the vigorous development of Socinian Unitarianism on Polish soil. A succession of Jesuit rulers, culminating in John Casimir, a Jesuit cardinal, brought this development to naught. For once, at least, the blood of the martyrs was not the seed of the church. An edict of exile was passed in 1658 to take effect in 1661, but it was enforced in 1660. As compared with the exile of the Huguenots from France, this was much more desperate and cruel; for the Huguenots had Protestant friends abroad, but these had none at all. A few were well received in Brandenburg. In 1730 eleven families of these were left. In 1838 two old men were the poor, feeble remnant of a sect which at one time had the promise of dominating all others in the kingdom of Poland.

A chapter on Transylvania gains much in interest from the fact that Dr. Allen has studied the Unitarianism of that country not merely in books, but as a traveller visiting the scenes of its tragedies and successes, and making the acquaintance of its modern representatives. The name of Francis David is their most honored name. Here, too, the Jesuit persecution was effective, but the triumph of a conservative temper was hardly less damaging. Where there were 425 congregations under David's preaching, there are now but 106. The whole story is full of interest and instruction, and it is told extremely well; the figure of David standing out with mournful grandeur against the darkness of a fierce and troubled time.

The history of English Unitarianism is rich in names of much more than sectarian repute —Milton, Locke, Newton, Penn, Clarke, Priestley, Martineau. With respect to Martineau, Dr. Allen makes a marked exception to his avoidance of living persons as subjects of characterization, allowing himself the pleasure of a liberal appreciation. Dr. Martineau contributes a letter which is printed as an appendix. Personally he is a Unitarian, but he does

not believe in Unitarian churches or other organizations. When Unitarianism began to organize itself (1774), he thinks that it surrendered its birthright. But there is little evidence that the movement by any other name would have been more liberal or more sympathetic with the best in other sects. As a movement of thought in sympathy with science, and a movement of ethics in sympathy with reform, Unitarianism, both in England and America, owes much to Priestley, and it has been generally true to his initiative; but, while Martineau appreciated the spirit of the Slave Power as clearly as his sister Harriet, he was one of the most perverse in his interpretation of the issues of our civil war.

Dr. Allen's chapter on the antecedents of New England Unitarianism is good work, and shows his stomach for statistics at its best. Everywhere it is a stomach that assimilates them and does not leave them crude and undigested for the torment of his page. But as he comes down nearer to our own time in the following chapters, he is, if not more instructive, much more entertaining, for he speaks that which he personally knows, and testifies to that which he has seen. He has a remarkable aptitude for sketching the characters of the men whom he has known, in a few lively strokes. On pp. 203–205 there are nearly a dozen of these portraits, which could not be better done. Emerson is made one of the goodly fellowship without any forcing of the note, so long he kept up the habit of preaching in Unitarian pulpits after his Boston resignation (1832), and so modestly he at length took his position as a layman in the Concord meeting-house. There is more emphasis on Parker, setting his relation to his Boston brethren in the clearest light, but we note the singular omission of any mention of Parker's anti-slavery work; and this extends to the whole period. That the words slavery and anti-slavery do not occur in the index might only mean that it is not complete, as it is not; but neither, with one exception, do we find them in the text, while the part taken by Unitarians in the civil war has liberal allowance. Even the characterizations of John Pierpont, Samuel J. May, and Freeman Clarke contain no allusions to their most significant endeavors. These omissions give the denomination a worse appearance than it deserves.

The gradual development of various denominational agencies is lucidly set forth. The avoidance of living persons sometimes effects a palpable injustice, as where Weiss and Wasson are named as representatives of the Free Religious Association, and Abbot, Frothingham, and Potter, who signified an hundred times as much for it, are entirely left out. Mr. Potter's death some months ago should have given him the freedom of Dr. Allen's book, for no other has so well expressed the later Unitarian thought. The details of p. 235 and those of p. 236 are related as cause and effect, but there was no such relation in the events. The "Western Issue" was inspired by theological timidity, not by the dread of moral laxity, for the prevention of which a system of "Committees on Fellowship" was organized. It is an interesting comment on some recent signs of impatience with the Unitarian name that of 444 churches only 197 at present bear that name; the others, with two or three exceptions, never having borne it. That of 510 living ministers more than 100 were educated in other forms of belief, would seem to indicate a certain tide in the affairs of men.

Dr. Allen's style is generally as direct as possible, but we seem to have a satirical intention in the sentence which speaks of the orthodoxy of the Andover School as "protected by the periodical signing of its creed by each of its instructors."

---

*A Traveller from Altruria.* By W. D. Howells. Harper & Bros.

SEVERAL of Mr. Howells's recent works have indicated his serious mental perturbation about our social conditions; his latest shows that he finds respite in the beautiful dream of that day when we shall all literally do unto others as we would be done by. With his customary literary skill, he heightens the fairness of the vision by a prefatory picture of the conspicuously ugly features of our actual state. Much the larger part of his book is given to a discussion of the difference between theory and practice in the American Republic, and here Mr. Howells speaks the thoughts of many men of his time with that clearness, force, and vivacity which have made his fame as a novelist; in the shorter part, the description of Altruria, he speaks the thoughts of Jesus Christ with graftings from Sir Thomas More, Bacon, and William Morris, all fused by that sweet though vague imagination which gives him some claim to sit among the poets.

From beginning to end the tide of his sympathy flows violently with the workingman, by which term is distinctly understood the man who works with his hands. "Goodness of nature," said the versatile and in practice scarcely Christlike Bacon, "is of all virtues and dignities of the mind the greatest, being the character of the Deity; and without it man is a busy, mischievous, wretched thing, no better than a kind of vermin." Mr. Howells seems to argue on the mistaken assumption that goodness of nature has its permanent and exclusive abiding-place only in the breast of the workingman, and that there can be no hope of its acquisition by others until we enter into a political condition where all shall work with their hands for at least three or four hours a day. We are not obliged to call upon history to testify that manual labor is not necessarily a purifier of the spirit and sure means of grace, nor to prove that the laborer, like the capitalist, may not on occasion show himself a mischievous, wretched thing, and a peculiarly harmful kind of vermin. It is well that we have not to fly to the historical argument for succor, for that is the argument conspicuously flouted by the socialist. Mr. Howells even scorns the argument from human nature; but he cannot be said to justify this scorn. There is, however, one historical precedent which the socialist professedly cherishes and declares to be the model of his ideal state. The traveller from Altruria dwells upon it. It is the tradition of the early Christian republics or communities. Without pretending to any accurate knowledge of these early communities, we have an impression that they were small and scattered and very poor, that they were held together by fear of persecution as much as by mutual love, and that, as this fear was lifted, the members began to drift apart, and each one to look out for his own interests. If the cases are to be paralleled, why is it not lawful to suppose that when the tyranny of capital shall have been abolished and all material distinctions levelled, when persecution and oppression and fear shall have become obsolete words, there may be another separation, degenerating again into an individual scramble for individual aggrandizement? The Altrurian of course would assert that this could not be, because human nature would have changed; so, as it had changed in Altruria, we look to him confidently for an explanation of how the change came about. But he fails us sadly. "I wish," he says, "that I had time to go into a study of some of the curious phases of the transformation from a civility in which the people lived *upon* each other to one in which they lived *for* each other." This lack of time is indeed to be regretted, because we feel that the secret of the transformation lies in those "curious phases," and that, understanding them, we should also understand how a proletariat which had long been in the voting majority and had persistently elected corrupt and vicious men to control public affairs, suddenly swung about and elected honest and virtuous men, and kept on electing them, till even the most hardened of former oppressors praised God that the old order had passed away for ever.

But such demand for detailed information is unfair to Mr. Howells speaking as a poet. We should enjoy the fabric of a vision without inquiring too closely about the solidity of its base. Less captious is it to ask whether he is not, for once, at fault as an observer of American life in some trifling social matters. Though the literary class in America is far from guiltless of the charge of kotowing to wealth and fashion, we hope it would be hard to find in it so arrant a snob and cad as the host of the courteous and childlike Altrurian. What man of sense (not to mention of letters) ever cared for five minutes whether his friend helped a porter with a trunk or not, or ever went into hysterics because the same friend took a turn at bootblacking? Moved by Mr. Howells's severe and on the whole just arraignment of the American nation, we must defend it in these small details. It has frequently been our privilege to see men representing the classes, gathered together at that mountain hotel, lend a hand with heavy trunks without exciting surprise or censure. And, as for bootblacking, had Mr. Howells got on the scent, he would probably have unearthed in that very hotel several young ladies, daughters of his banker or lawyer, who carry about with them them the needful implements, and not only exercise their muscle on their own foot-gear, but also cordially proffer a "shine" to an unskilled friend, who would otherwise be obliged to put up with the blotchy performance of the despised and oppressed menial who, "on account of inadequate wages," is "compelled to accept a tip" for his more inadequate services. We linger on these insignificant defects in observation, not for their own sake, but because they lead us to hope that in graver affairs we may also be less black than Mr. Howells has painted us.

---

*Rudin.* By Ivan Turgenev. Translated from the Russian by Constance Garnett. New York: Macmillan.

A NEW translation of Turgeneff's novels direct from the Russian has long been desired by those who are acquainted with them in the original. There has not even been uniformity to recommend the versions of the various volumes which have hitherto been accessible to the English-reading public. Some of them were made through the medium of the German, some through that of the French translations or "arrangements," and the result was truly appalling, both as to style and as to errors. For several years past efforts have been made to induce some American publisher to undertake this greatly needed work in the standard

literature of the world, but without avail. An English firm, that of W. Heinemann, has had the laudable enterprise to begin the issue of a set of seven volumes, of which 'Rudin' is the first.

Despite the advantage of direct translation, we sadly miss the exquisite phrasing of the beautiful Russian tongue, which was music itself from Turgeneff's lips. Of the story we need say nothing: its main features are familiar. Rudin, the hero, is the sort of man, common in other lands besides Russia, who is endowed with the gift of empty eloquence which charms all undiscriminating hearers—and nothing more. His life is barren of fruits; he dies, uselessly, in a vain cause. Stepniak, the revolutionary writer, who furnishes an interesting preface to the new series, adding remarks about Rudin in particular, seems, however, to claim him more particularly for Russia, as the typical man of the epoch of 1840. His comments on the little circles of that day, whose members worshipped at the shrine of one of their own number, are very helpful for the foreigner who desires fully to understand the significance of Turgeneff's creation. Equally so are the suggestions as to the reason why Turgeneff was earlier appreciated abroad than at home, though we are inclined to believe that Stepniak exaggerates in this respect through loyalty to hospitable foreign lands, as opposed to his native land, where he can no longer live, and which he is rather too much in the habit of underrating in most respects. We should like to commend to him and his sympathizers a paragraph in this very book, which he professes to admire so much:

"Rudin's misfortune is that he does not understand Russia, and that, certainly, is a great misfortune. Russia can do without every one of us, but not one of us can do without her. Woe to him who thinks he can, and woe twofold to him who actually does do without her. Cosmopolitanism is all twaddle; the cosmopolitan is a nonentity—worse than a nonentity. Without nationality there is no art, nor truth, nor life, nor anything. You cannot even have an ideal face without individual expression; only a vulgar face can be devoid of it."

The translation seems faithful, too faithful in the matter of punctuation in many instances to render the sense clear to English readers. The constant use of . . . is thoroughly Russian, but not admissible in English as a substitute for the dash in most of the cases where it is used here. The inconvenience of its use, even in Russian, is great, as it is the punctuation which is intended to indicate that the censor's office has eliminated disloyal or displeasing passages. There is no question of anything of that sort here; but the pointing is suggestive and unpleasant to our unaccustomed eyes. The principle observed in the transliteration of proper names is not very easy of comprehension. The final Russian *v*, followed by the symbol which hardens the pronunciation, is rendered as *v* in English—Turgenev, Lezhynov, and so forth. But Bassistoff, which terminates in the same way, is reproduced in the conventional manner which represents the sound, while the *s* is doubled, as never happens in Russian.

The most serious defect of the translation lies in its awkward, infelicitous phrases, which sometimes amount to bad grammar. From internal evidence it would seem as though Miss Garnett must have been born of English parents in Russia, and reared there, speaking English as her auxiliary, not her native tongue. We will content ourselves with a number of quotations, occasionally supplying the missing words or the proper form in brackets. "She is too weak; [it is] impossible to move her." "Hospitals, schools, and all that sort of things, are mere waste of time." "Why were you asking your way of that girl, am I to suppose?" "There is hardly any one more [else]." "There is one other of our neighbors." "I [have] purposely refrained from questioning you until now." "Volintsev had got on to curious terms with him." "In everything wise design and beauty seemed apparent, everything took [assumed] a clear and yet mystic significance." "It was a soft and peaceful evening, but under this peace was felt [could be felt] the secret breath of passion." "But up to this time I [have] believed in you." "He got up, buttoning himself up." "This letter proved to her clearer than all possible arguments." "He behaved . . . just as if he had not been [were not] a living man, but his own statue set up by public subscription." In the sentence: "a rosy-cheeked lad in a gray cloak, with a blue sash round the waist," the word should be coat, or caftan, not cloak. All these mistakes are precisely of the sort which Russians commit in writing English, and it is to be hoped that the following volumes will receive severe revision as to language and punctuation, for the comfort of the public, who will find this volume rather rough, unsatisfactory reading, notwithstanding its manifest excellences in other directions. This respect is certainly due to Turgeneff, who loses more than almost any other writer in losing his own language.

---

*Geschichte der Musik in England.* Von Dr. Wilibald Nagel. Erster Theil. Strassburg: K. J. Trübner; New York: Westermann.

BRIEFLY stated, the object of Dr. Nagel's book is to show that England was not always in the van as regards musical culture and progress. He begins with the earliest records and intends to end with Purcell, "the last great English composer whose works, in part at least, have an unmistakable English coloring." The Handel period has, he thinks, been treated with sufficient detail by Chrysander, while "the English musical culture of recent decades is rooted almost exclusively in German soil."

With all his industry and erudition, Dr. Nagel does not succeed in removing the feeling that our only certain knowledge about the practice of English music in the earliest historic times is that we know very little about it. Yet there are a few scattered intimations that music played a great rôle in social life long before Shakspere's time; such as Beda's statement (eighth century) that at banquets the harp went from hand to hand, and that if a guest was unable to sing, he left the hall ashamed of himself. In the eighth century also are found the first certain traces of the use of organs in churches, whereas Spain had them in the fifth. Dr. Nagel considers it beyond doubt that it was from Germany that England got her first organ, and he mentions the odd fact that at one time letters were written on the keys to enable the player the more readily to recognize the key called for. The earliest organs had a compass of only one octave, and quantity of sound was obviously more valued than quality; at least Wulston describes an instrument which made a noise like thunder and was audible all over town.

In a chapter on the theorists, our author himself is obliged to admit that their writings confirm Vischer's assertion that the science of æsthetics is still in its infancy, and that "in the æsthetic wisdom of the mediæval theorists, apart from J. de Muris, nothing is more remarkable than the rigid persistence with which one repeats what another had said before him." The technical remarks in this chapter are intelligible only to those who have some acquaintance with the history of musical notation and polyphony; but in general the author has kept the promise made in the preface that he would relegate to the appendix such details as interest specialists only. In some aspects human nature and musical practices and abuses were the same in those early days as now. John of Salisbury complains that the main object of the singers was to make the congregation admire their technical skill by adorning ecclesiastic melodies with runs, and Tunstede says that the vanity of these singers was so great that when they had executed a piece particularly well, they would turn round to make sure that the auditors were properly impressed.

In common with all champions of English music, Dr. Nagel makes much of "Sumer is icumen in," which, being the oldest known canon, seems to indicate that the English were the first to introduce the important device of imitation in music. The inference is a bold and risky one, but has never been disproved. On pages 79, 80 some very interesting remarks are quoted on the part which the yodle and mountain echoes may have played in suggesting imitation and canonic form in music. A sentence on p. 83 indicates that Dr. Nagel, in common with many German writers, makes the mistake of classing the Flemish composer Lassus (Orlando Lasso) among Germans. On the same page we read about the great influence which English instrumental music had on the Continent; a claim which seems scarcely substantiated by the subsequent chapter on this department of music.

Minstrelsy is discussed at considerable length, a distinction being made between minstrels who were regularly connected with some court and those who had no master but wandered whither they pleased. There seems to be reliable evidence that in England as in France minstrels were also occasionally employed in churches. But the Church did not usually look on them with favor. Some of the opposition was based merely on the objection to the use in church of other instruments than the organ; but the real animus of the clerical enmity to the minstrels is to be traced to the bounteous rewards which some of the nobles heaped on them, and which the Church would not have refused itself. Hence Johannes de Sarisberia chides them: "In histriones et hujusmodi monstra hominum ob famæ redemptionem et dilationem nominis effunditis opes vestras!" And there was some cause for these complaints of extravagance. For a performance at Westminster in 1306, for instance, each of the minstrels received from 40 to 65 shillings, at a time when workmen received a penny for a day's work. A real artistic musical activity did not prevail at an English court before Henry VIII., during whose sumptuous reign "church service in England became a concert performance," to the great scandal of the pious.

Dr. Nagel regrets that the subject of music in its best period is ignored by Green in his 'History of the English People,' and incidentally he puts in a good word for Scherr's 'History of English Literature,' which the German savants affect to look down on because it combines the unpardonable virtues of vivacity and imagination with erudition. As for our author's own style, it is, as a rule, clear enough, without being conspicuously elegant. Not infrequently he falls into the German vice of trying to cram several sentences into one, as in the following

warning example: "Indem sich die Kirche ängstlich vor der im Volke traditionell lebenden Kunst (es ist mehr als wahrscheinlich, dass die Volksmusiker erst durch die fahrenden Kleriker eine Notenschrift kennen lernten; ihre Unkenntniss einer solchen schliesst das frühere Vorhandensein nationaler Tonschriften nicht aus) abzusperren suchte," etc.—wherein the verb is separated from the noun it ought to follow by two complete parenthetical sentences!

---

*Essays and Criticisms.* By St. George Mivart, F.R.S. Boston: Little, Brown & Co. 8vo., 2 vols., pp. 472, 461.

A BOOK like this is a valuable acquisition to the library of any thoughtful man. Few can turn its leaves without meeting something that will profitably fix their attention. Variety, comprehensiveness, and vigor make it generally attractive. In particular it will attract philosophical students, especially such as interest themselves in the literature of evolution. With depth and originality of thought, and a clear and forceful style, the author gives evidence of an amount and diversity of information that comes as a surprise to those who have made his acquaintance only through his zoological writings. Essays, reviews, and criticisms on history, politics, psychology, travel, evolution, education, origin of species or of faculties, church matters, life, growth, heredity, selection, force, energy, volition, tastes, emotions, and other topics, from various sources of original publication, make up these bulky volumes. To say that they are those of a devoted Catholic, of a conservative in regard to modern evolutionary theories, and one who holds it to be impossible that the mind of man should have developed from that of a lower vertebrate, will to some extent suggest the principal bias in discussion. A limit to the evolution of all creatures lower than mankind appears, according to this author, in a difference in kind, not in degree, that divides them from men—a something altogether new, the capacity for apprehending abstract ideas, that first appeared on earth with the coming of man. Like his opponents, Mr. Mivart cannot imagine the distinct origin of man; but, he continues, inability to imagine is no ground whatever for not believing a thing if reason supplies good evidence in its favor. That the reason-provided evidence is sometimes based on assumptions or imaginings is one of the severest criticisms to be brought against the book. An impassable gulf is asserted between the lower vertebrates and men; but, after being taught the necessity of what may be called a soul in addition to the physical existence of the living creature, and that the higher forms have been evolved from lower through variation due to internal reactions or tendencies induced by external stimuli, a reader is not satisfied arbitrarily to stop development at sense perceptions, so called, and say that advances in the direction of the self-consciousness and reason of man are impossible and inconceivable.

BOOKS OF THE WEEK.

Alden, Mrs. G. R. "Wanted." Boston: D. Lothrop Co. $1.50.
Bailey, W. F. The Law of the Master's Liability for Injuries to Servant. St. Paul: West Publishing Co.

*"This series of linen covered volumes that have contained so many delightful sketches and tales."*—TIMES.

**Small 16mo Buckram. With Frontispieces. 75c. each.**

*JUST OUT.*

By the author of "The Prisoner of Zenda,"

## A CHANGE OF AIR.

With portrait and notice of Anthony Hope.

The experiences of Dale Bannister, poet, in Market Denborough. A genial, dramatic story with a tragic and exciting undercurrent, characterized by the briskness and humor of "The Prisoner of Zenda," but with a more prominent love interest. It suggests, through action, not through preaching, a lesson of moderation and charity.

*IN THE SAME SERIES.*

Fourth Edition of the Romance of To-day.

**Anthony Hope's Prisoner of ZENDA.**

**Mrs. S. M. H. Gardiner's Sketches of the "Friends,"**

**QUAKER IDYLS.**

**Second Edition of Beers' American Tales,**

**A SUBURBAN PASTORAL.**

**2d Edition of Jerome's Love-Tragedy and Tales,**

**JOHN INGERFIELD.**

**HENRY HOLT & CO., N. Y.**

---

*READY SEPT. 1.*

THE STUDY OF ENGLISH FICTION.

By Prof. W. E. SIMONDS of Knox College. Contains chapters on the various epochs in the development of English fiction, and selections illustrative of its growth.

**D. C. HEATH & CO., Publishers,**

BOSTON. NEW YORK. CHICAGO.

---

*History of Dartmouth College*

AND THE TOWN OF HANOVER, N. H., by FREDERICK CHASE. Vol I. To the outbreak of the college controversy. Large 8vo, cloth $3 50, net; postage 24 cents. Sent on receipt of price by JOHN K. LORD, Hanover, N. H.

---

*THE PULLMAN STRIKE.*

By Rev. WILLIAM H. CARWARDINE. 25 cents, postpaid. CHARLES H. KERR & CO., Publishers, Chicago.

---

*EDNA LYALL'S*

## DOREEN.

THE STORY OF A SINGER. By EDNA LYALL, author of "Donovan," "We Two," etc. 12mo, buckram cloth, ornamental, $1.50.

"Edna Lyall's . . . new story . . . is one of her best. It has, naturally, enough of tragedy to make it intensely interesting without being sensational in any offensive sense. The heroine, Doreen, is a delightful character study, strong, lovable, womanly, and genuinely Irish. Mrs. Bayly is a conscientious writer, imbued with deep feeling, a high purpose, and her style is attractive and pure."—*Boston Daily Advertiser.*

# YALE MIXTURE.

The choicest tobacco made, and pre-eminently a gentleman's smoke.

**Marburg Bros., The American Tobacco Co., Successor, Baltimore, Md.**

# STANDARD WORKS FOR INSTRUCTORS & STUDENTS

## Æsthetics and Art.

**Raymond** (George L., Professor of Æsthetic Criticism in Princeton College). **The Genesis of Art Forms.** An Essay in Comparative Æsthetics. 8vo, illustrated, $2.50.

**Barber, E. A. (A. M.). The Pottery and Porcelain of the United States** An Historical Review of the Ceramic Art in America from the Earliest Times to the Present Day. Cloth, 8vo, with over 200 illustrations, $4.00.

## Astronomy.

**Proctor** (Richard A., F.R.S.). **Half Hours with the Stars.** A Plain and Easy Guide to the Knowledge of the Constellations. True for every year. Maps and Text especially prepared for American Students. 4to, boards, pp. 39, $2.00.

—— **Easy Star Lessons.** With 48 Star Maps and 35 other illustrations. Octavo, cloth extra, $2.50.

## French.

**Crane** (Prof. T. F.), of Cornell University. **Tableaux de la Revolution Francaise.** Selections from French literature relating to the Revolution of 1789. Edited with notes. With introduction by Pres't A. D. WHITE. 16mo, $1.50.

—— **Le Romantisme Francais.** A Selection from the Writers of the French Romantic School, 1824–1848. $1.50.

—— **La Societe Francaise au Dix-Septieme Siecle.** An Account of French Society in the XVIIth Century in its Relations to Literature. Given in Extracts from Contemporary Memoirs, Correspondence, and Novels. 16mo, $1.50.

—— **French Ballads.** Printed in the original text. Edited by Prof. T. F. Crane. Illustrated. $1.50.

## German.

**Hart** (James Morgan, LL.D., Professor of Modern Languages in the University of Cincinnati). **German Classics for American Students.** A series of Texts of the masterpieces of German Literature, accompanied by an Introduction, a running Commentary, Critical Notes, and (where the text renders it desirable) Glossary. The series is printed in neat 16mo volumes, bound in extra cloth.

The following volumes are now ready:

I. **Goethe's Hermann und Dorothea.** $1.00.
II. **Schiller's Piccolomini** With map $1.00.
III. **Selections from Goethe's Prose.** $1.00.
IV. **Goethe's Faust.** Part I. 1.00.
V. **Schiller's Ausgewalte Briefe. Edited by** PAULINE BUCHHEIM. $1.00.
VI. **Lessing's Prose** (selected). Edited by Prof. H. S. WHITE. $1.00.

**Klemm** (L. R.). **Poesie fur Haus und Schule** A collection of standard German Poetry, selected and arranged for use in schools and the home circle. 16mo, cloth extra. $1.25.

**Rosenstengel** (Prof. W. H.). **A High-School and College Reader of German Literature.** 12mo, cloth, $1.50.

**White** (Prof. Horatio S.). **Deutsche Volkslieder.** (A Selection from German Folk Songs.) Printed in the original text. $1.50.

## Language.

**Phyfe** (W. H. P.). **How Should I Pronounce?** or, The Art of Correct Pronunciation. 16mo. 75c.

**Seven Thousand Words Often Mispronounced.** A guide to correct pronunciation. 16mo. $1.00.

## History.

**Abbott** (Evelyn, M.A., LL.D., Fellow of Balliol College, Oxford). **A History of Greece.** To be complete in three parts.

Part I.—**From the Earliest Times to the Ionian Revolt.** 8vo, pp. xi + 553. 8vo. $2.25.

Part II.—**From the Beginning of the Ionian Revolt to the Thirty Years' Peace.** 8vo. $2.25.

The author expects to complete his work in four volumes, but each volume will cover a distinct period of history, and will be complete in itself.

**American Orations.** From the Colonial Period to the Present Time. 3 vols., 16mo, $3.75.

**British Orations.** A selection of the more important and representative Political Addresses of the past two centuries. Edited, with introduction and notes, by CHARLES K. ADAMS, President of Cornell University. Uniform with "American Orations." 3 vols., 16mo, $3.75.

**Pelham,** (Prof. Henry F.). **Outlines of Roman History.** 12mo. With maps, $1.75.

This work has been planned more particularly to meet the requirements of higher-grade students and reading-classes.

### Heroes of the Nations.

Cloth extra,..... $1 50
Half morocco, uncut edges, gilt top..... 1 75

Eight volumes now ready; each volume is fully illustrated, with maps and plans.

I. **Nelson.** By W. CLARK RUSSELL.

II. **Gustavus Adolphus.** By C. R. L. FLETCHER, M.A.

III. **Pericles.** By EVELYN ABBOTT, M.A.

IV. **Theodoric** the Goth. By THOMAS HODGKIN.

V. **Sir Philip Sidney.** By H. R. FOX-BOURNE.

VI. **Julius Cæsar.** By W. WARDE FOWLER, M.A.

VII. **John Wyclif.** By LEWIS SERGEANT.

VIII. **Napoleon.** By W. O'CONNOR MORRIS,

IX. **Henry of Navarre.** By P. F. WILLERT, M.A.

X. **Cicero.** By J. L. STRACHAN DAVIDSON, M.A.

## Political Science.

**Ashley.** (W. J., M.A., Fellow of Lincoln College, Oxford; Professor of Political Economy in the University of Toronto). **An Introduction to English Economic History and Theory.**

Part I.—12mo..... $1 50
Part II.—12mo..... 3 00

**Cooley** (Thos. M., and others). **The Constitutional History of the United States as Seen in the Development of American Law.** 8vo, cloth extra, $2.00.

**Morey** (Prof. Wm. C., of the University of Rochester). **Outlines of Roman Law.** Comprising its Historical Growth and General Principles. 8vo, cloth extra, $1.75.

**Sterne** (Simon, of the New York Bar). **The Constitutional History and Political Development of the United States.** An Analytical Study. Fourth edition, revised, with additions, $1.25.

**Taussig** (Prof. F. W.). **The Tariff History of the United States, 1789–1888.** 12mo, $1.25.

—— **The Silver Situation in the United States.** (Questions of the Day Series, No. 74.) 8vo, cloth, .75.

## Works of Reference.

**Great Words from Great Americans.** 32mo, with Portraits. Cloth. .75.

**Haydn. A Dictionary of Dates:** In one very large volume of more than 1,000 pages. Price, $5.00; half russia, $8.00.

**Putnam** (G. P., A.M.). **The Best Reading.** A Classified Bibliography for Easy Reference. New edition, corrected, enlarged, and continued to August, 1876. By F. B. PERKINS. 12mo, paper, $1.00; cloth, $1.50.

*Second Series.*—Comprising the publications for the five years ending December, 1881. 12mo, cloth, $1.00.

*Third Series.*—Comprising the publications for the five years ending December, 1886. 12mo, cloth, $1.00.

*Fourth Series.*—Comprising the publications for the five years ending December, 1891. $1.00.

**Tabular Views of Universal History.** Compiled by G. P. PUTNAM and LYNDS E. JONES. Square 8vo, cloth extra, $1.75.

## Literature.

**Irving's Works—The Traveller.** By WASHINGTON IRVING. Edited by WILLIAM LYON PHELPS; prepared to meet the matriculation requirements of New England Colleges. 12mo, cloth, with introduction and notes, $1.00.

**Raymond** (George Lansing, Professor of Oratory and Æsthetic Criticism in the College of New Jersey at Princeton; author of "The Orator's Manual"). **Poetry as a Representative Art.** Amply illustrated with quotations from the best authors. Crown, 8vo, pp. xv + 446, $1.75.

**Representative Essays.** Being selections from "Prose Masterpieces from the Modern Essayists," comprising papers by Irving, Lamb, De Quincey, Emerson, Arnold, Morley, Lowell Carlyle, Macaulay, Froude, and Gladstone. 8vo, cloth, $2.00.

**Richardson** (Charles F., Professor of Literature in Dartmouth College). **American Literature, 1607–1885.** 2 vols., 8vo, pp. xx + 535, 456, $6.00. College edition, two volumes in one, 8vo, half leather, $3.50.

Part I. **The Development of American Thought.**

Part II. (Completing the work). **American Poetry and Fiction.**

**Tyler** (Moses Coit, Professor of English Literature in the University of Michigan). **A History of American Literature.** Vols. I. and II.—The Colonial Time, 1607–1765. Agawam Edition, Vols. I. and II. bound together, cloth, $3.00.

**Van Laun** (Henri). **The History of French Literature.** 3 vols. in one. 8vo, beautifully printed and bound in extra cloth, $3.50.

*** *Special Terms to Teachers, for examination and introduction, Educational Lists, and Prospectus of the Heroes Series, Nations Series, German and French Classics, Knickerbocker Nuggets, Hebrew Scriptures, etc., etc., sent on application.*

**G. P. Putnam's Sons, 27 and 29 West 23d St., New York.**

# The Nation.

*NEW YORK, THURSDAY, AUGUST 16, 1894.*

## The Week.

WE abate nothing from our abhorrence of the surrender of both houses of Congress for the time being to an odious monopoly when we say that the passage of some tariff bill at the present time was necessary to the prosperity of the country. People must earn their bread and butter in sunshine and in rain, in storm and in calm. We might have dragged on another twelvemonth in the same mire that we have wallowed in for eighteen months, and yet have been no nearer victory. The unprincipled Trust that has had the national Legislature by the throat ever since the tariff bill went into the Senate, would not let go its hold by mere lapse of time, since its profits were as great under the McKinley act as under the Senate contrivance, if not greater. For this reason we have no censure for those members of the House who finally decided to accept the Senate amendments. We should have preferred to fight on till the people could pronounce their verdict upon Gorman, Brice, Smith, and Camden, but we acknowledge the force of Chairman Wilson's speech in which he said that he had done everything in his power, and that he could do no more—he could not even hold his own supporters together any longer. We cannot ask impossibilities of any man. Therefore, while we should have voted with Mr. Cockran and Mr. Warner if we had had a vote to give, we have nothing but praise for Mr. Wilson, who has proved himself a just and able and brave man throughout this long contest, and has actually sacrificed his health in his eagerness to do his duty.

---

The bill that has finally passed is a considerable improvement on the McKinley tariff. It reduces the protective duties fully 25 per cent. on the average, and, what is even more important at this time, it puts the Government in funds. It restores the Treasury balance and thereby assures the continuance of gold payments. We have all the time considered the Treasury situation the darkest cloud on the business horizon. The behavior of Congress in this matter has been simply brutal. That body has seen the gold balance slipping away, and the general balance dropping from week to week and month to month, and has refused to pass any law to enable the secretary to borrow on easy terms, thus compelling him to borrow $50,000,000 on hard terms. Every railroad corporation in the United States, and every municipal corporation, has the power to make temporary loans in emergencies like that which befell the national Treasury. It was by oversight merely that the national Treasury was not empowered to do the same thing. Yet when the secretary and the President asked for power to make a two or three-year loan at a low rate of interest (perhaps 2 or 2½ per cent.), Congress turned a deaf ear and compelled a ten-year loan at a higher rate. As the national Treasury is the keeper of the ultimate cash reserve of the nation, holding, in this respect, the place held by the banks of England, France, and Germany in those countries, its condition was the barometer read by the business community from day to day. The insensibility of Congress to that condition was accordingly the heaviest weight that business men had to carry. All of that load is now lifted, for although it will take some time for the new law to get in operation, there will be a gain from the very first, and it will be helped by the upstarting of trade in all directions.

---

That the Treasury, as well as general business, will experience prompt relief from the passage of a tariff bill is clear from the amount of goods now in bonded warehouses. The last number of the *Financial Chronicle* states the value of dutiable goods in bond, on June 30, as $43,182,922—$5,000,000 more than a year before, and $15,000,000 more than on the same date in 1892. The amount must have considerably increased since June 30, as importers have sent everything to bond not required to fill actual orders. With duties pouring into the Treasury on withdrawals of these and on the fresh importations which will doubtless speedily take on new volume, our financial corner will be turned. With a bigger balance at command, Mr. Carlisle will not have to lie awake nights thinking about the gold exports and the narrowing reserve behind our fiat silver certificates. In fact, the era of business prosperity which is now inevitable, unless ex-President Harrison succeeds in his fixed determination to hold it off, will do a great deal to ease up the theoretical as well as practical difficulties of the silver question. If men are conscious that they and the country are not ruined, they will not be button-holed off into a corner by the bimetallists to hear an elaborate explanation of how they came to be ruined.

---

The *American Manufacturer* of Pittsburgh notes an increasing demand for pig-iron. The month of August, it says, "opens up very auspiciously for something like a return to a normal rate of pig-iron production. Following up the gain, at July 1, of 21,110 tons, August has a further and increased gain of 27,977 tons in the weekly rate of production. The reaction towards heavier production is sharper than it was on July 1, and comes in some measure from all the furnaces, but especially from those which have been enabled to resume by reason of renewing their receipts of coke from the disturbed Connellsville region." The reduction of the duty on pig-iron to $4 per ton by the Senate bill does not seem to have any terrors for the producers in this country. There is little reason why it should when the cheapest English pig sells for $8.62 per ton at home, the corresponding grade at Pittsburgh selling for $10. Bessemer pig is now quoted at $11.05 in England and at $12.25 in Pittsburgh. The Senate duty is strictly prohibitory. The duty of 10 per cent. ad-valorem in the House bill, added to freight and other charges, would have been ample for protection, and would have afforded some relief to the iron industry of New England.

---

The wool trade has started into fresh activity, and prices have advanced 10 per cent. There is a sudden demand for woollen goods in consequence, as buyers know that an advance in the raw material must be followed by an improvement in the finished product. The Boston *Journal of Commerce* takes a cheerful view of the situation as to domestic goods, and says that the recent depression has led manufacturers to improve their designs, so that they now produce a grade of goods superior to anything that has ever before been made in this country. "The last year," it says, "has seen a wonderful advance in this direction, and it has been brought about largely by the dull times. Had our markets been ready to take the goods that were made last year as fast as produced, our manufacturers would have been satisfied to have followed in the same old track, or nearly so, as before; but, with a sensitive market, they have been compelled to try to produce a superior class of goods, one which the market would prefer to those of their competitors; and as a consequence the style and finish of our goods this season are far ahead of anything previously attempted." The Home Market Club ought to make a note of this. There are better ways to secure and retain the home market than a protective tariff. Foreign markets are sometimes achieved by skill and economy also. It is a fact of some importance that we are exporting more carpets to England at the present time than we are importing from that country.

It has been highly significant to note that the most strenuous efforts of the Sugar Trust, its impudent interference with legislation, have been made not to secure the one-eighth cent differential, but a change from specific to ad-valorem rates. Thus, Mr. Havemeyer testified (June 12) as follows.

"I went to Senator Vest. . . . I had my sugar samples, to which I have already referred, with me, and opened them before him, in his house, and showed him how indispensable it was to the sugar-refining industry of this country that if any duty was to be assessed on sugar it should be under the ad-valorem system, and not any uniform or specific rate. . . .

"The Chairman—What occurred between you and Senator Caffery?

"Mr. Havemeyer—The substance of what I have already testified to, as to what took place on the subject of raw and refined between myself, Jones, Vest, and Brice, except the absence of the samples. I endeavored to show him that it was to the advantage of Louisiana to have the form of duty ad valorem, irrespective of what the rate was. Mr. Caffery told me that he was satisfied his people wanted specific rates."

Mr. Havemeyer testified also that Senators Gorman and Brice "appeared to apprehend the subject better than anybody else," meaning the advantages of ad-valorem over specific rates. This is altogether likely.

---

Senator Caffery's speech is even more to the point than Mr. Havemeyer's testimony. The Senator said that the finance committee agreed, after much labor, to a specific duty ranging from one cent for 80° sugar up to 1.26c. for 98°, with ⅛c. additional for refined. "That schedule," said the Senator, "conceded nothing whatever in favor of the Sugar Trust more than what appeared on its face. It was with reluctance accepted by the people of my State. They thought that by economy, by better methods of extraction and evaporation and even of agriculture, they could get along with that." What happened next? Mr. Caffery met Senator Gorman in the Senate doorway, and the latter said to him: "That schedule means free sugar." It happened oddly enough that Senator Brice made the same remark. Why did it mean free sugar? Because the specific schedule was "unacceptable to the refining interest," as Senator Jones explained. All the Republican Senators would vote for free sugar as a party issue, and then a few votes on the Democratic side would suffice to put raw sugar on the free list without any bounty. By this threat was Mr. Caffery driven to support the deceitful ad-valorem rate. Well might Senator Caffery ask: "What occult power is it which has the force to change a fair schedule adopted after long deliberation? What subtle influence is it which is pervading the Senate, that can strike down the agriculturist and uphold the interests of what is called a Trust?"

---

The withdrawal of the militia from Chicago may be said to be the dropping of the curtain upon the great drama that has been enacted there. So quickly does public interest shift from one theme to another that this event has aroused but little attention; and yet it will be watched by careful observers with considerable anxiety. There must be a large number of men on the verge of starvation in consequence of their own folly and the crimes of their leaders, and it remains to be seen whether these men are disposed to resort again to violence. Several attacks upon workmen occurred upon the withdrawal of the troops, and the situation at Pullman will continue to be critical for some time to come.

---

The injunctions issued by the courts against the members of labor unions are more and more sweeping in character. Judge Dugro of the Superior Court of this city last week enjoined the members of the Journeymen Tailors' Union, on strike against a reduction of wages, from assembling or loitering near their employers' places of business, from maintaining "a system of patrol, picketing, or espionage," and from all other acts tending to hinder their employers from carrying on business. The order goes even further, and specifically restrains the defendants from interfering by means of published circulars or notices, or by signs or menaces of any kind, intended to prevent workmen from seeking employment from the plaintiffs. It also prohibits "enticing" any one from the employment of the plaintiffs. The terms of this order are broader than those of the restraining orders recently issued by the United States courts in the West. It is doubtful if they are not too broad. It is one thing to threaten a man with violence if he goes to work, and quite another to entice him away from it, although the trade-union methods sometimes suggest the Irishman's "enticing with a club." We need not go back to the policy of the statutes against laborers in our zeal for restraining trade unions. Recent English decisions have drawn the line very sharply between what may and what may not be done by laborers on strike, and we believe that they are to the effect that neither "enticing" nor picketing is unlawful. It may not be desirable to follow these decisions, especially in regard to picketing, but they are deserving of consideration.

---

The North Carolina Democrats have adopted a platform which combines folly and good sense. The commendation of the Administration is expressed in unusually good English for a political platform. The President's action in checking anarchy at Chicago, his sturdy efforts to secure tariff reform and a reduction in the cost of government, and the freedom from scandal which has marked his administration, are specifically and distinctly praised. But when the talismanic word silver was mentioned, the mental balance of the delegates could not be preserved. They want equal privileges for the despised and downtrodden metal at the United States mint. "Free and unlimited coinage of both gold and silver at a ratio of 16 to 1, such being the ratio of coinage which has heretofore held in the United States," is the demand of these enlightened financiers. The truth is, that silver is coming to occupy a position something like that of the negro during the days when the "bloody shirt" was waved. That was a picturesque and righteous grievance, enjoyed by Northern politicians exclusively, and the Southerners have not had any really good and satisfactory cause to sympathize with for a good while. But silver is just the thing. It is a kind of peg upon which to hang denunciations of capitalistic greed and unrighteous laws and unjust discriminations, combined with expressions of tender regard for the poor and oppressed. No platform-maker feels happy without a plank of this kind. A few years ago the "bloated bondholder" answered the purpose. Now it is silver, and in a few years it will be something else equally factitious.

---

One of the most encouraging aspects of the Democratic victory in Alabama is the support it gives to the forces of law and order. The Republican-Populist fusion not only stood for free silver and general demoralization, but specifically attempted to make political capital out of the severe labor troubles from which the State has suffered. Gov. Jones had shown great firmness and energy in putting down riotous strikers by the use of troops. He had given especial offence to the Kolbites by guarding with State troops some negro miners who had taken the places of white strikers. During the campaign a story was put in circulation that Col. Oates, the Democratic candidate for Governor, would be another Jones, and would shoot down lawless strikers. So far from being frightened at this report was Col. Oates that he took occasion flatly to affirm that he would shoot down defiant law-breakers, strikers or not. This manly declaration was nuts to the politicians on the other side, who then had the colonel "just where they wanted him," and were going to beat him by many thousands of votes. But the extra thousands mostly went his way, the result indicating that many Republicans must have refused the ticket urged upon them by Senator Hoar.

---

An interesting question on the subject of State constitutional changes in New

York has come up at Albany in connection with the proposed amendments in regard to the suffrage. One of these amendments provides that at the general election succeeding the one at which the amended Constitution shall be voted on by the people, the question of striking out the word "male" from the suffrage section shall be submitted separately, and that, in case of a favorable vote on that proposition, women shall thereafter vote at all elections upon the same qualifications and conditions as are prescribed to male citizens. The peculiarity of this amendment is, that it is proposed to submit it to a popular vote without having its merits passed upon at all by the Constitutional Convention, and the point has been raised that this course is itself unconstitutional, one student of the question expressing himself as follows:

"Such is not the method of amending the Constitution provided by the existing Constitution. The very object of a written constitution, or any constitution, is to protect the general organic law from being changed at any time by the mere expression of the will of the majority. The Constitution itself, and the act of 1893 creating the present convention, both provide that the province of the convention is 'to revise and amend the constitution.' It has no other powers whatever. It seems to me that it has no *moral* right at least to do indirectly what it cannot do directly."

---

There is involved in this subject the old question whether an amendment of the fundamental law, when once accepted by the people on a popular vote, does not become a part of that law, regardless of any informalities in the way in which it has reached a vote of the people. Good constitutional lawyers, like the late Charles O'Conor, have held that an affirmative vote by the people is sufficient and final. Our State Constitution itself is very indefinite in regard to the ratification of amendments prepared by a constitutional convention. It provides specifically, with regard to amendments proposed by the Legislature, that, before they are referred to the people, they must be "agreed to by a majority of the members elected to each of the two houses" (of two legislatures). Section 2, article 13, which provides for constitutional conventions, is utterly silent as to the manner in which such a convention shall decide upon constitutional changes, not even providing that a vote of the people shall be necessary to their ratification. This has permitted the point to be raised that the action of the convention on amendments might be considered final if the Legislature had not provided by law for submitting them to a popular vote.

---

The failure of the corn crop in portions of Kansas and Nebraska has produced great distress, and we read that people are abandoning their withered farms and moving eastward to find places where they can procure subsistence. Others, who have lost only half their crop, are staying at home, hoping for better times next year. There has been no suggestion from any quarter that these poor people should have a bounty from the national Treasury or that the great principle of protection should be set in motion for their benefit. Yet it is difficult to say who is better entitled to it. True, there is an embarrassment in applying it to a man whose crop has been entirely ruined. If it were only half destroyed, we might give him a bounty on the other half sufficient to bring the whole up to the average of former years; but when he has nothing for a basis, how can we determine what he ought to have? This is a problem which we submit to those who believe in bounties, and to the social philosophers who think that the state might institute some desirable means of distributing wealth without first producing it.

---

The new Government of Hawaii being clearly *de facto*, its recognition by the United States follows as a matter of course. Minister Willis practically recognized it on the promulgation of the new Constitution and the inauguration of the new officers. If the Hawaiian revolutionists of 1892 had only proceeded decently and in order, as they have since done, they would have saved themselves and this country a world of trouble. They could just as well have set up their oligarchy under the form of a republic then as to have waited two years, and in that case they would have prevented the scandal of getting recognition as a *de-facto* government, when they were only a lot of scared conspirators and were asserting control over their country only for the purpose of giving it away. Recognition of a *de-facto* government is a proceeding into which should enter no element of personal sympathy or judgment of the character of the government recognized. We do not bow to governments, as we do to people, because we like them or approve of them. Stevens put a tremendous amount of feeling and republican sentiment into his recognition, pledged and written in advance, of the revolutionists. In fact, he felt so strongly and liked the men so well that he forgot to observe that they were not a *de-facto* government. Having now become such unquestionably, they are entitled to recognition by all countries having dealings with them, and will doubtless get it.

---

Those who have confidently counted upon a great temperance revival in the Catholic church, as a result of the stand taken by Archbishops Satolli and Ireland and Bishop Watterson, have overlooked several important facts. One is that the Baltimore Council practically ordered all Catholic liquor-sellers to go out of business. But this had no effect, and it is not likely that what a council could not do a bishop can. Then there is what may be called the vested interest of the liquor business in the Catholic church. Last week's *Independent* culled a choice lot of saloon advertisements from the pages of the Catholic religious press. No severe thundering against saloon-keeping can be expected from such organs of the church. Finally there remains the fact, stoutly insisted upon by the organ of the liquor-sellers in this city, that saloon-keepers are among the most generous supporters of the Catholic church, and that it cannot afford to antagonize them. In the recent debate on the legacy duties in the House of Commons, the chancellor of the exchequer told of a miserly Scotchman who had on his death-bed left a large sum to the Established Church, and of the remark made of the transaction that it was the biggest premium against fire ever paid in Scotland. Doubtless it is the same kind of a premium, duly paid, which makes the Catholic saloon-keepers of this city easy in their minds on the score of interference with their business by ecclesiastical authority. They can pin their faith with absolute serenity on Archbishop Corrigan's profound remark on this subject, that "acceptance of principles is not to be confounded with blind application of the same."

---

Extremely bitter contests were formerly waged between the gas companies of London and their workmen, during which there was danger that the city might be left in total darkness. In 1889 one of the great companies decided that for every penny it could reduce the price of gas (which by statute enabled the companies to increase their dividends) it would give the workmen 1 per cent. on their wages and salaries. In 1891 this bonus was 5 per cent., and amounted to £11,400. The price of coal in 1892, owing to the prolonged strike, was so high that it was necessary to raise the price of gas, with the result that the bonus fell to 3 per cent., the sum divided being £6,648. The next year the bonus reached 4 per cent., equalling £8,395, and for the year just closed it rose to the very considerable sum of £12,435. During this year, also, the rate of bonus was increased, so that for every penny reduction in the price of gas the bonus was to be 1½ per cent.; upon the condition, however, that one-half of the bonus should be left in the company's hands. The workmen have deposited with the company £26,530, and they have invested in the company £12,867, besides which £3,720 was invested for workmen by trustees. These facts are unusually suggestive, and appear to indicate that industrial peace is by no means a Utopian ideal.

*THE PROTECTIVE SYSTEM ON EXHIBITION.*

THE events of the last few weeks, we venture to say, have made more free-traders than many carefully prepared arguments could. Most people have not the patience, if they have the capacity, to follow prolonged and complicated discussions of economic theories and governmental policies. They have enough to do to think out solutions for their own domestic, social, and business problems, and they very plausibly reason that, as they pay the salaries of Congressmen, they should be relieved from considering the affairs of the nation. As a rule ninety-nine-hundredths of the people of the country have usually the vaguest possible ideas as to what is going on in Congress, and this is especially true of such technical matters as rates of duty upon imported goods. The determination of such rates is naturally supposed to require much technical knowledge of numberless mechanical arts, as well as a profound acquaintance with the conduct of business affairs. It is unnecessary to say that the beneficiaries of protection have assiduously confirmed this impression. They have generally replied to arguments in favor of lower duties by saying that such matters could be understood only by business men, and that arguments contained in books were only theoretical and were always despised by men of affairs. In this manner they succeeded for many years in having things their own way, while the public supposed the successive tariff acts with which the country was burdened were the product of a wise statesmanship.

The disclosures that have recently been made of the true method of constructing protective tariffs have startled and disgusted many worthy people who are reluctant to believe any one worse than themselves. It now appears plainly enough that there is no statesmanship required, nor any technical knowledge. All the theatrical "business" of protection is done away with. The public has been taken behind the scenes, and has had an opportunity to see how the actors look before they are stuffed and padded and powdered with the alluring promises of protection to American homes and all the familiar protectionist humbug. It is not an acquaintance with mechanical processes, after all, that is indispensable in these matters, but an acquaintance with secret political methods. Knowledge of business means knowledge of the stock market, and success in affairs means astuteness in making the utmost possible gain out of positions of honor and trust. Legislative favors are dispensed like a "free lunch," which finishes in something like a bar-room quarrel.

The Republicans profess to be very much shocked by this state of affairs, and lay it to the innate sinfulness of the Democrats. The country is also shocked, but it is not at the wickedness of the Democrats so much as at that of the protective system. This dickering and bargaining always went on among the Republicans when they were in power, but they were able to keep it quiet. They did not have a great deal of trouble in doing so, because they always raised duties instead of lowering them. If any one got angry and threatened to talk out because his business did not get more favor, they pacified him by giving him more. They had a commission to lower duties once, and it took a good deal of expert testimony about the arts and processes of manufacture, and about cost of production and prices. As a result of the evidence the commission proposed to recommend a small reduction in duties. But the protected interests had no idea of allowing any such thing. When it came to that, they were for the full measure of protection, no matter what might be figured out by men of business, and they had their way.

When the Democrats undertook to deal with the tariff, they had very different conditions under which to work. It was no longer possible to ask this Senator and that how much they wanted for their particular interests, but the question was how much they were willing to surrender. The process of disgorging is not a pleasant one, and it is not surprising that there has been a falling out over it. Perhaps even the Republicans might have let out some disagreeable secrets if they had undertaken to lower duties. But it is perfectly clear that the real iniquity is in the bargaining, and not in disclosing the bargaining. It is the protectionist Senators that were elected as Democrats against whom the popular wrath is hot, not against the other Democrats or the Democratic party. The exposure has been a good thing for that party. It has exhibited the spirit and the methods of protection in such an odious light that it will be more difficult than ever to defend it. It has made it clear that the better element in the Democratic party has taken up the fight in behalf of honest government in earnest, and it has made it clear how fierce that fight is, and what foul blows are struck by the adversary. The question of revenue sinks out of sight while it remains undetermined whether legislative favors can be bought or not by wealthy interests. It would be a relief to have this question settled now, but it is of sufficient importance to make delay immaterial. Protection has made an exhibition of itself which will prevent its posing hereafter under any hypocritical guise of affection for the poor. Its tenderness is plainly for the rich; the richer, the better. If it can once be turned out of our legislation, even the Senate may be purified and Congress enjoy as much freedom from the odor of corruption as the English Parliament has enjoyed since the repeal of the Corn Laws.

*DESTRUCTIVE COMPETITION.*

THERE are many features of the competitive régime which are odious, and some of its results are apparently so destructive as to lead those who do not consider the subject in all its bearings to pronounce a rather sweeping condemnation of the whole system. A correspondent, whose letter we print elsewhere, appears to have taken this position, and to have thereby involved himself in considerable perplexity. He gives his approbation to the doctrine that the destruction of property by rioters must be prevented by military force, if necessary, but he reasons from this that the destruction of property by commercial competition must also be prevented by law. He maintains that it is just as criminal for corporations to destroy capital by wrecking business as "it is for the anarchist to do the same thing by applying the torch." There is no legitimate competition, in his judgment, "that does other than it would be done by." And he instances the Standard Oil Company, which reduces the price of oil until the small refiner is driven out of business and compelled to abandon his plant. Such conduct on the part of the Standard Oil Company, our correspondent thinks, makes it the duty of the President of the United States to call out the army and navy, if necessary, in order to make Mr. Rockefeller behave himself.

We are not concerned to defend the commercial practices of the Standard Oil Company, which may be in numerous respects morally reprehensible; but we are quite sure that our correspondent is laboring under some confusion of thought, and we shall endeavor to disabuse him of some erroneous impressions, which are undoubtedly shared by many other people. The destruction of property by violent and unlawful acts is evidently an entirely different thing from the destruction of property which takes place through the progress of invention, the development of transportation, and the improvement of business methods. Doubtless many pack-saddles were rendered useless when wagons came to be employed. Many stage-coaches were practically destroyed by the construction of railroads. And many antiquated processes and inferior and badly situated refineries, we presume Mr. Rockefeller would say, had to be abandoned, owing to the decreased cost of production attained by the Standard Oil Company. Further reflection will undoubtedly convince our correspondent that every business man who undersells his neigh-

bor would declare upon oath that he was actuated by the purest motives, and was endeavoring to give the consumer advantages in the shape of cheap commodities which his neighbor, with his cumbrous system of doing business and his old-fashioned machinery, could not possibly afford. To puncture with bayonets every person who offered to sell goods at a less price than they could be sold for by such manufacturers as rejected all improved processes, and conducted their business in the most wasteful and unscientific manner, would be something quite contrary to the principles upon which the world now carries on its affairs.

A more careful analysis will probably reveal to our correspondent the fallacy which has misled him. The act of withdrawing from their employment on the part of a large number of men clearly tends to the destruction of their employer's capital. But this is not an act which is to be prevented by bayonets. It is not in itself an unlawful act, nor a violent act. It may even be an act which promotes the general welfare; and it would certainly be prejudicial to the general welfare were all such acts prohibited. Formerly they were prohibited, and so was underselling; but both prohibitions belong to a darker age than ours. It is quite clear that a distinction must be made between acts directly destructive of property and those indirectly productive of that result. *Non constat*, as the lawyers say, that the refiner who complains of the competition of the Standard Oil Company might not, by the exercise of great skill and ingenuity, meet that competition. Even if he cannot do so, it can never be admitted that the furnishing of commodities cheaply is properly called destruction of property. It may involve the destruction of some property; but it creates more than it destroys. The fallacy of our correspondent is the fallacy of protection, and many an honest citizen has felt his blood boil when told how British manufacturers were "flooding our markets with cheap goods," to the destruction of American manufactories.

Perhaps what our correspondent had in mind in his complaint was success in competition due to illegal and fraudulent practices and to the prostitution of legislation. In such case it is evidently not the successful competition that is objectionable, but the means employed to make it successful. We are glad to agree with our correspondent in condemning such means, and will support any measure which he proposes that will bring about the general adoption in commercial practice of the golden rule. For the present we know of nothing better calculated to produce this result than the doing away with protective duties, the iniquity of which is now being exhibited to the whole country in a very conspicuous manner. We anticipate a considerable improvement in business morality from this reform. If it does not reduce the evils of competition materially, we shall then be glad to consider more effective measures, but we shall not include in these the use of bayonets.

## *THE RULE OF THREE VOLUMES.*

ENGLAND'S most venerable institutions seem to be suffering a concerted attack all along the line. With crown and altar assaulted by Mr. Keir Hardie and Welsh Disestablishment, respectively, and the heroic wealth of hall and bower tilted at by death duties and the progressive income tax, it is no wonder that the pen should also be called upon to forfeit its ancient English dower. Wordsworth did not specifically state what is the ancient English dower of the pen, but if there is anything more ancient or more English than the three-volume novel, we should be glad to be told what it is. At any rate, it is nothing less than this peculiar glory of Great Britain that irreverent hands would now dim.

The trouble began with a notice sent out to publishers at the end of June by the two great circulating libraries—Mudie's and W. H. Smith & Son's. It was a polite intimation that, after December 31, 1894, the libraries must have their three-volume novels 20 per cent. cheaper than heretofore, and also that the publishers must undertake not to issue a cheaper edition within twelve months of publication. Far from being a blow at the sacred three-volume, this was intended further to hedge it about with dignity. It was on account of the "great and increasing demand for novels in sets of three volumes" that the libraries were forced to take the step. Subscribers would have their three volumes, full weight and specific gravity; and with all single-volume fiction rusting on their shelves, what could the proprietors do but demand cheaper raw material and a guarantee against competition by an edition in one volume? So they looked at it, in their blind worship of the three-volume novel, little dreaming that their action would shake literary England to its foundations and start a revolution which threatens to put an end to the very existence of three-volume fiction.

But so it was, tyranny overreaching itself in the proverbial fashion. Many of the three-volume publishers were cowed, as it is an extremely fine thing to have a library take an edition of 750 or 1,000 copies off your hands and thus eliminate all risk; and nothing seemed easier than to turn to the three-volume authors and say, "You see, our profits are to be cut down 30 per cent., and so must be your pay." But, to the unspeakable surprise and dismay of the publishers and the librarians, the book-worm has turned. The authors have thrown down their pens where they stood, and vowed that they will strike and starve before they will see their wages cut 30 per cent. Some of them have made the horrifying suggestion that, if the libraries must save 20 per cent. somewhere, they ought to increase their subscription price by that amount. The managing committee of the Authors' Society met on July 23 and resolved, after consulting "several prominent novelists and other members of the Society, and finding them almost unanimously opposed to the continuance of the three-volume system," that "the disadvantages of that system to authors and to the public far outweigh its advantages; that for the convenience of the public, as well as for the widest possible circulation of a novel, it is desirable that the artificial form of edition produced for a small body of readers be now abandoned."

It would seem as if sacrilege could no further go, but it did. The bold innovators began to question the authority of the three-volume novel, whether on the ground of antiquity or merit. That it was an old institution simply showed that it had its origin in the barbaric times when writers and readers were few, and paper and printing very costly; when the parson, the squire, and the doctor were the only readers in the parish, and required three volumes, so that each man might always have one, to read backwards or forwards as he chose. Awful things, too, before only whispered in dark corners, have been openly said about the quality of three-volume fiction. Such words as "rubbish" have reached the ears of the affrighted public, and a recipe which Mr. Zangwill long ago gave, in a furtive way, for the manufacture of a novel in three volumes, has been brought out into the light. It is as follows, and nothing could better mark the dissolute state of morals in England than its popularity:

> "One idea makes one paragraph.
> Two paragraphs make one page.
> Twenty pages make one chapter.
> Twelve chapters make one volume.
> Three volumes make one tired."

Growing bolder with their own audacity, the revolutionary authors have pointed out the fact that few of the great names of English fiction, past or contemporary, have been identified with three volumes. Scott usually published in two volumes. Dickens and Thackeray used monthly numbers. Indeed, how can a first-class novelist submit himself to the three-volume fetters? That means an edition of 750 copies to start with, slowly going the rounds of the British Isles. With no other edition possible for a twelvemonth, the book loses its vogue before it has a chance to get any, and when the cheap edition does come out, it has to encounter on

the book-stalls the worn three-volume copies which the libraries are by that time selling for a song. Both publisher and author would find a better profit in a cheap edition of 4,000 to begin with than an issue of 750 at three times the price and practically exhausting the market. The extra cost of manufacture in three volumes with thick paper and wide margins is in the face of the general law of the greatest possible economy of production, and is of itself enough to doom the system.

That it is doomed seems highly probable. It has been, in fact, for some years little more than a refuge for the mediocrity and stupidity of writers, and the laziness of publishers. The latter say that they will be much slower in accepting manuscripts with no library guaranteeing in advance to take the whole edition. They ought to be slower. They ought to know their business well enough to print only books which will sell themselves; and it is on such terms that the best literature best will thrive. The indiscriminate acceptance by the libraries of anything that has the requisite size and weight is fatal. One publisher meekly suggested that the libraries exercise a little more care in ordering novels, but was sternly told that he knew nothing about the business. With sixty thousand subscribers to whom anything is a novel, provided it comes from Mudie's or Smith's and is in three volumes, it would be the height of folly to look a novel too curiously in the mouth. But the signs of the times are pretty clear that the three volumes must go. To many in England such a conclusion will seem as unsettling as if the Graces or the Furies were no longer to be three, or as if all Gaul were no more to be divided into three parts.

## WHEAT-FARMERS IN MARYLAND.

FREDERICK, August 4, 1894.

"THE largest crop in twelve years, and the lowest price ever known," is the condition facing the wheat-farmers in central and western Maryland. Their case is fairly typical of all wheat-farmers on the Atlantic slope. With them wheat is the heart-blood of wealth, and its quotations are the pulse-beats of society. It is at once the standard and the basis of their life. In the heyday of the flush times after the civil war, these tillers of the soil in the fertile valleys between the ranges and spurs of the Appalachian chain raked in dollars by shovelfuls. The yellow cereal went at what now appear super-fancy figures. The old men longingly talk of those glorious days of enormous profits. One of them says: "I remember in 1854 the harvest was so large the barn couldn't hold it. I asked my father what to do with that left out. He said, 'Thresh it and sell it.' I did so and got $1.40 a bushel for it. In 1868, I sold 400 bushels at $3.05 per bushel. If I get fifty cents this season, I shall be lucky."

Wheat certainly does not pay for itself under present conditions. The most careful of rural bookkeepers say it costs more than fifty cents a bushel to grow it. If three or four dollars per acre go into fertilizer, and another dollar into seed, and a couple more for labor, threshing, and marketing, and a reasonable allowance be made for wear and tear on stock and machinery, fencing, buildings — what is left, unless the yield is over twenty bushels an acre, even for a land-owning family? While if three or four more dollars are added for rent, the tenant either scamps the life out of himself and family, or crops the land to death and then goes elsewhere. Commercial manure must be used; that from the barn brings fine straw, but seems to lack some constituent demanded by the grain. Every year or two lime must also be added.

With the bottom out of wheat, there seems no refuge in any product. Corn and oats are each less expensive than wheat to raise, and would pay much better now, as all three are selling at about the same price per bushel; but this is an exception, and another year farmers might lose heavily on them. Over a score of seasons ago corn was worth eight dollars a barrel, now less than three, and even then it was not cultivated as a money crop. Once lean cattle could be bought at three or three and a half cents a pound, and after being fattened be sold for five cents. Now the only profit in such a speculation is from the extra pounds put on, since one gets no more per pound for the fat steer than he paid for it when lean. Horses were once regularly raised for market, but the introduction of rapid transit in street railways has killed the business by diminishing the demand. Grades of these animals now go for less than a hundred that used to fetch three hundred dollars and upwards. There is no money in pork, and no pork is raised except for home consumption. Only a limited number of farms can be devoted to milk or trucking. All can gather up a little surplus on eggs and butter. Two vegetable canneries have been of great help for some few years. Sweet corn brought fifteen or twenty dollars an acre, but the factories overstocked the market and have had to curtail the output, and in consequence reduce the price of the raw material. Creameries also have aided in furnishing a steady outlet for milk all the year round. But all these smaller industries are by-products, and the ordinary farm could not be run on them. There must be some mainstay, and this has always been wheat; but it is certain it cannot remain so unless prices should go up or a new use be found for it. Wheat, in fact, is so low that, out of its very worthlessness, it may spring into fresh, glorious life. Farmers have discovered that it is highly valuable in making milk, beef, and pork. One has kept statistics, and declares it is worth at least a dollar a bushel to fatten hogs on. Years ago our astonishment was great when corn was burnt as fuel in the far West, but, with the "golden grain" fed to beastly swine, we shall be struck dumb.

With this steady sinking of prices it was inevitable that new social and industrial tendencies should appear. As a slight symptom the old people point out that the average table is not so laden with rich meats as in days of yore, nor, they declare, can the young men stow away the loads of food their fathers could. An elderly gentleman says it was common for him to sit down to a dinner of baked turkey, baked goose, baked ham, roast pig, roast beef, fried oysters, and often game; but nowadays he sadly notices much less variety of meats, and much more "trimmings." Another change has been wrought through the adoption of improved machinery, as sulky-ploughs, seeders, drillers, and binders. Men now ride wearing light carpet slippers instead of walking in thick cowhide boots. One man on the binder, another to drive, and three to shock, will harvest as many acres as thirty hands did when they reaped with the cradle. But the tendency the most far-reaching in its social effects is the proportionate increase in tenant farming. This is a general opinion among farmers, and the figures of the last two censuses would seem to indicate the same increase. Much of the land about here was once held in extensive tracts. The family of the historic Carroll of Carrollton once owned the large "manor" estate, some half-a-dozen miles south of Frederick, about as good soil as exists in this region. These wide holdings were gradually carved up and sold so that only a few farms now exceed two hundred acres. Credit was generously granted, and energetic young fellows had a smooth path before them. They cared nothing about mortgages, because, with an almost virgin soil and wheat three dollars a bushel, payment seemed easy, and was easy. But, as the market went down, the claims felt heavier and the annual instalments were harder to meet. Creditors became clamorous and foreclosed the mortgages, and a family considered as landowner was classed as tenant. While such an accession swelled the number of renters, all such were always tenants in fact.

In another way, farms that were once tilled by the owners are now cultivated by tenants. Through pitiless competition in American farming, prices have been forced so low that virtually all a farm-owning family makes here is a return for its labor, stock, and implements. Interest on capital invested in the farm is practically disregarded. Life has come down to "hard-pan," and gentleman farming has nearly disappeared. The average man who tries to hire all work done while he only oversees, will find himself slowly sinking in the mire of debt and failure. Only those succeed who can bear a strong hand themselves. A man of weak constitution, or one hampered with a helpless family, is fighting against fearful odds. Even an active young married couple often find the tasks too numerous for two pairs of arms, and many years must elapse before youngsters can be reared to divide the toil. In such instances it has been found the best course to rent out the place to greater bodily strength, and retire from the struggle, seeking lighter employment in neighboring towns and villages. Another recruit is then added to the ranks of tenants. Poor Richard's Almanac faithfully applies:

> "He that by the plow would thrive,
> Himself must either hold or drive."

Under such circumstances the renter can come into the race only by living on a lower level of comfort than his more favored brother. It is on this narrow margin of constrained self-sacrifice that a capitalist investor in land bases his expectation of profit, and it goes without saying that farms are no longer a popular form of investment. Under a gradual modification now going on, capital will be still shyer of seeking this field, because there can be no regular or fixed income. Low prices are driving out money rents for the share system, by which one side furnishes the land and half the fertilizer and half the seed, and the other side does everything else, and the gross yield is divided equally. There are advantages in this method for both parties The landlord can prevent barbarous "skinning" and reckless "overcropping," and can insist on a wise plan of rotation. The tenant is not at the mercy of sudden depressions in the market. There is certainly a wide avenue for lying and cheating, but farmers are usually honest, and, be-

sides, the foot of fraud would be seriously impeded by the mesh of checks in the shape of thresher figures, public-scales receipts, and way-bills.

Another social modification has been the actual or relative improvement of the hired labor class. All farm products have fallen two-thirds and more. Groceries, clothing, furniture, and implements have fallen 50 per cent. and upwards. The wages of ordinary unskilled labor have also fallen, but relatively not so much as the prices of commodities. The average day laborer, with his fifty cents a day, now can buy more than he could buy with his dollar a day twenty years ago. Perhaps this partly explains why it no longer pays to hire labor. Still, so alluring is city life that in many localities loud complaint is heard that labor is hard to get for the field and still harder for the house. Hired labor has gained, but debtors as a rule have suffered, since the majority of them borrowed on a basis of high prices. Mortgage statistics of the last census are not available, but the general opinion is that the greater number of these claims were entered into to satisfy the universal land-hunger of Americans for a home, and a few to make needed improvements. It is safe to say that these owners would usually prefer to have the homes with the burdens than to be without both.

With wheat "away down," and nothing else in sight, there seems justification for the farmers as a class considering the outlook gloomy. As symptoms of their declining condition they refer to the numerous mortgages, and point out that the farms are not so nicely kept up as formerly. They advance divers theories as to the causes of their trouble, but these may be all grouped under four heads: overproduction, extravagance of living, railroad rates, and unjust legislation. Since all commodities are down in price, the first may be dismissed, as there can be no such thing as general overproduction. The old men are the ones who generally believe that the farmers are going at too lively a gait in their style of living. They look back to early days of simplicity, when there was not much machinery and very little travelling, and now they point to the excursions, and summer trips, and the more fashionable cut of the farmers' clothes, the piles of papers, magazines, and books, and Southern melons, California fruits, and early vegetables. They are positive the farmers got into all this whirl and swim during the time of war prices, and assert that hard times have come from trying to live beyond their means. One old gentleman pointed out a special sign of this extravagance in the number of buggies now kept. Some large farm families seem to be running a livery stable, because every young fellow must have a buggy of his own, while years ago one such vehicle was thought enough in a large family, as the farm wagon could be used on special occasions for rides to church or neighborhood gatherings. But few old people like the present. Even admitting that the farmers are living more expensively, they are only following the general law of development of man's wants. It is clear enough they are not living in as much comfort as their city cousins of a corresponding class, else farmers would not be so willing to move to the cities, and so grimly determined to stay there even if they can hang on only by their teeth. But there is perhaps a grain of hard financial truth in this view of the conservative folks. Owing to the close communication in the channels of trade and finance through all parts of the Western world, it was impossible for us to maintain a level of prices so far above the normal level obtaining in all the main part. We were the smaller member and had to recede from our high-water mark.

There is an indefinite feeling among farmers, also, that the transportation companies get more than a fair share out of them, but there is not that unreasoning, silly opposition to railroad interests seen in South Carolina and Kansas. While an undoubted growth of sentiment in favor of Government ownership of railroads and telegraphs can be detected, the farmers do not yet clearly conceive in what their grievances consist. The same may be said of their belief that the law-makers have not treated them fairly. There is a strong feeling of uneasiness against legislative bodies for the tender solicitude shown to Trusts and monopolies, but these humors of indignation have not yet gathered themselves into a head so as to be felt in political action. On one point the mass of the farmers are decided as to the discrimination against them. The bulk of the white farmers here believe with all their souls that because of the high tariff they are made to pay extra prices for nearly all they buy. They hold that the prices of what they buy ought to fall in the same proportion as the prices of what they sell. As for fearing to meet the competition of the world in their own products, they do not dread that any more than they dread cold in winter or heat in summer.

In spite of the decline in prosperity, and in spite of the hard times and darkening future, they cling fast to old-established principles of finance, in striking contrast to many of their brethren down South and out West. Extensive inquiry failed to find a free-silverite, greenbacker, or pronounced Populist, though there are organizations of this party near Washington and Hagerstown. The general opinion was boldly voiced by a young fellow who asked: "What good would free silver do me? I have no silver mine. What is the use of more greenbacks? I can get all the money I want now when I have anything to get it with." This would doubtless seem pitifully poor and spiritless to the high-flown orators in South Carolina and Kansas, but this is the answer they would receive to their wind-bag speeches on finance if delivered here. It is very likely that these farmers learned a currency lesson some years ago, in the days of trade dollars, when, the value of that coin being about 95 cents, one month the Baltimore and Ohio Railroad and some other corporations here paid their employees in this depreciated coin. As the farmer is a fundamental factor in the economic problem, the loss eventually fell on him, and he no longer bites at cheap money.

C. Meriwether.

## THE CASTLE AT MILAN.

Alassio, July 17, 1894.

The great cities of Italy, like those of other countries, have increased in population during the last twenty-five years relatively more than either the smaller cities or the country as a whole. Rome, since it became the capital of the united kingdom, has doubled the number of its inhabitants, and Milan, without the stimulus of the extraordinary events that have favored the growth of Rome, has shown an even greater progress. According to the figures of the *Almanach de Gotha*, in the interval between December, 1871, and the end of 1892, the city of 200,000 souls became one of over 425,000. No other city in Italy has gone ahead in the same proportion. Naples, that had 450,000, has now 535,000, Turin, from 192,000, has 330,000, Palermo, from 185,000, has 275,000, and so on. In the same time Milan has added a new city to the old. Stretching beyond the walls in all directions are quarters of new streets, largely of the showy architecture that in Milan, Rome, or Vienna produces very much the same impression. It may be said by the way that in the streets outside the old walls and beyond the boundaries of the *dazio*, or tax levied by the city on all that the city eats and drinks and much that it otherwise needs, living is considerably cheaper than inside those limits. Hence families of moderate means have found that *fuori del dazio* they can afford a much finer and more commodious apartment than would be possible for them within, and the new quarters are favorites with this class.

It is in the centre of the city, however, and with the aid of the methods of the late Baron Haussmann, that still more striking results have been achieved. The space about the Duomo, narrow on the side of the Corso Vittorio Emanuele, has been widened so that a good view of the north flank of the great church is now to be had along its entire length. Then, from the end of the broad piazza in front of the Duomo, and opposite its western façade, a wide street has been cut straight through one of the most populous quarters of the old town to the Foro Bonaparte, a souvenir of the Cisalpine Republic and the Napoleonic kingdom of Italy. At this point, a huge semicircular space, the city has always ended, kept at a distance, just as a crowd is sometimes pushed back by the police, by the immense Castle opposite, meant by all governments, from that of the Visconti down to that of the Austrians of our day, to overawe Milan as much as to defend it. As a result of its vicissitudes, the later ones of which had all involved mutilation, it was a huge, shapeless, forbidding-looking mass—

"Monstrum horrendum, informe, ingens,"

and, up to the end of October of last year, served as quarters for troops. Behind it was the Piazza d'Armi, stretching away to the Arch of Peace, better known as the Arco del Sempione, as it was begun by the first Napoleon to mark the beginning of the road over the Simplon, but was finished by the Austrians, who also changed the name. All about it was a plain, boundless except on clear days, when the jagged blue and white barrier of the Alps filled the north and west.

The broad street pierced from the Piazza del Duomo to the Foro Bonaparte, called the Via Dante, was begun with warm faith in the future of Milan. It is lined on both sides with splendid buildings, and great numbers of enterprising tradespeople took the shops along it with the expectation of making a rapid fortune there. Instead of that, the success of the street was slow in coming—as in the case of the Avenue de l'Opéra in Paris; for awhile it did not "draw." Shop after shop shut up, and many a tradesman, prosperous hitherto, failed. But others came to take their places, and, if affairs are not even yet brilliant, they are at least in the way of improvement. Beyond the Via Dante blocks of splendid houses have, for a few years past, been springing up, gradually closing in upon the castle and the Piazza d'Armi. The monster had lost his terrors, and soon to the advancing city became a sort of King Log, an object of contempt and inviting encroachment. It was no place for a garrison and drill-ground—the space was wanted for

fine houses. The old, mutilated Castle was helpless as well as ugly, and was threatened with destruction. It had been built by tribute extorted from the people, its history was one of tyranny and wrong, its old age was sordid, and, moreover, its dead mass was a hindrance to the development of the city, just as formerly had been its repressions and exactions.

Fortunately, there was a voice raised in opposition. There had been good as well as bad in the old times of which the Castle was the relic. At any rate it was the expression of the history of Milan, and, if cleared of latter-day defacements and restored to something of its pristine state, was a monument of the past worthy to rank with the Cathedral and the Ospedale Maggiore. It ought to be a source of pride to the city and an object of its care, and might even be of use as well as an ornament. This opinion has prevailed. In October last the garrison gave up its quarters, and the work of restoration was begun. This was intrusted to the architect Luca Beltrami, a fortunate choice as well as almost a necessary one, not only because he was one of the foremost advocates of preservation, but also because of his special fitness for the task, with his general culture and his knowledge and skill as an architect. Of this last his design for the new façade of the Duomo—an admirable piece of adaptation—gave abundant evidence; his published writings answer for the rest.

Immediately after its evacuation by the troops, the restoration of the Castle as nearly as possible to what it was in the time of Lodovico il Moro was begun, and pushed so vigorously forward that the present aspect already justifies the undertaking. Hewing away the bricks and mortar about the square openings that did duty as windows showed that under them the original Gothic mouldings were still in great part intact, so that the restoration of the noble windows of early days was an easy matter. In many other cases it was necessary only to brush away the clumsy excrescences of modern times to bring to light some lovely vestige of the *quattrocento*. It was thus that an exquisite loggia of the time of Galeazzo Maria Sforza was disengaged from its filling of plaster, and that quantities of mouldings, sculptures, and frescoes have been uncovered. In face of these treasures it was pleasant to see the surprise of a friend of mine who had passed the period of his military service within these walls without suspecting what they hid. What has been found is of a quality to make one mourn for what has been lost. It is known that Bramante was employed upon the Castle, but of his work there is nothing of which one can now be sure. There is a charming covered bridge attributed to him on the strength of a certain resemblance to his style, and of the known fact that he did construct such a bridge; but that is the utmost that can be said. Perugino, Filarete, Borgognone, and Leonardo da Vinci were also among the artists who worked here. Of Leonardo, indeed, a number of designs for the general making-over of the old stronghold into a gorgeous palace of the Renaissance are still extant. Frescoes, too, attributed to him as well as to Borgognone have been discovered.

Moreover, something besides clearing away rubbish has been accomplished. The truncated towers have been carried up to their original height in their original forms. What these were is not doubtful, as representations of the Castle at all periods of its existence are not wanting. It is wonderful how they have transformed a mass that was barely saved by its immensity from being insignificant and was squat in spite of its height, into one that is imposing and picturesque. The Castle is again what it once was, as far as its outward aspect is concerned, and the Piazza d'Armi, a year ago an arid waste, is already a green garden, a worthy setting to the revived splendor of its architecture. No doubt the park is not much like that where the Sforza chased deer as well as smaller game; but as a park for the Milanese public its English landscape effects are appropriate enough, as they also are to the new uses of the Castle. This now belongs to the city and is destined to receive the municipal museum of archæology and art, the city archives, a school of art, and a museum of the *Risorgimento*, the history of the revolts against Austrian rule, and all that relates to the raising of Italy into an independent and united kingdom. One of the huge round towers, with walls nearly twenty-five feet thick, is turned to peaceful service as a distributing reservoir.

It is scarcely to be wondered at, however, that there should have been a strong feeling in favor of destroying the old pile. Certain of the ancient tyrants, Gian Galeazzo Visconti, Galeazzo Maria Sforza, and Lodovico il Moro, had indeed gathered about them there the greatest artists and men of letters of Italy, and their court was perhaps the most splendid of Europe; but for the Milanese the Castle had too many memories of oppression and exaction On the extinction of the Visconti dynasty, the city declared itself a republic—the Ambrosian republic—the first act of which was to tear down the stronghold of its despots. Within three years, however, Milan fell into the hands of Francesco Sforza, and was forced to build it up again. They had paid for its first building, and not only did they now pay for its rebuilding, but with every change of rule—and back and forth like a shuttlecock between Italians, French, Spaniards, and Austrians—the Castle suffered and had to be restored, and strengthened, and enlarged; and Milan always paid the bill. The people knew this so well that when, under the Cisalpine republic, the era of universal peace and liberty was opened, a petition to Napoleon to destroy the Castle could not gain sufficient subscribers to make it worth the presentation. The wiser heads were distrustful even of that period of boundless hope; and it is notorious that on this occasion the wise heads were not wrong. Napoleon blew up the outworks with which the Spaniards had surrounded the mediæval structure, but he preserved this as the centre of a costly system of embellishment, fortunately abandoned when scarcely begun, and leaving to the present generation merely the arch of the Simplon, the Arena, and the name, Foro Bonaparte. Then came the Austrians, and the Castle would, had it been destroyed, have had to be rebuilt—of course by the people who had torn it down.

This summer the courts and immediate surroundings are occupied by an exhibition of industries and arts—a better consecration of a new epoch than were the temples, arches, smoking-altars, columns, colossal statues, etc., with which Napoleon celebrated the triumph of the Cisalpine republic, built in sham Greek style, of sham stone and marble, in token of sham liberty and brotherhood. The Milanese paid for those, and on the present occasion they have again paid, but of their own free will, and presenting the spectacle—rare as the dodo in Italy, whatever it may be elsewhere—of an exhibition supported entirely by the city where it is held, without receiving, or even asking, any subvention from the Government, and even disdaining the usual lottery. The *Nuova Antologia* (May 15) very properly called attention to the dignified course of Milan; it is, however, doubtful if there be in Italy another city capable of such initiative, or even of imitating the example already given. Not for nothing is Milan known among the cities of the Peninsula as "la *grande*"; its truest title to the epithet is in the character of its people—the very élite of the country.

It would be pleasant to show chapter and verse for this assertion, but our present business is with the Castle. The veracious Baedeker has told tourists that this was "once the seat of the Visconti and the Sforza," and that "the corner towers and part of the wall connecting them on the S. W. side" (*i. e.*, the front toward the city) "are the sole remains of the original building." We know now that the present structure was never inhabited by the Visconti; all that remains of the Castle of their times being a few shapeless masses of brick and mortar, left standing as historical curiosities in the new gardens, and the foundations which Francesco Sforza retained and built upon. We also know that of *his* Castle much more is left than the façade toward the city; that, in fact, notwithstanding successive changes of all sorts, it is, in essentials, as it was at the death of Lodovico il Moro. When the restoration shall be finished, aided by the attractions of the collections within and the gardens without, the monument will resume its place among the ornaments and the sights of Milan.

Its rediscovered value has given occasion to a good number of publications. The most important is that of Luca Beltrami, 'Il Castello di Milano durante il Dominio dei Visconti e degli Sforza—1368–1535' (Milan, 1894), a handsome octavo volume drawn from original sources and abundantly illustrated. The edition is limited to 500 copies at 22.50 lire. This work is supplemented by another by Gen. Luchino Del Mayno, 'Vicende Militari del Castello di Milano dal 1706 al 1848, e cenni sulle Trasformazioni Edilizie del Castello dalla caduta degli Sforza ai nostri giorni, di Luca Beltrami' (Milan, 1894). The show of documents in these two volumes is calculated to repel the ordinary reader, and Signor Beltrami has kindly issued for his benefit a little handbook, 'Guida Storica del Castello di Milano, 1368–1894,' quite sufficiently and agreeably presenting the essential parts of both the larger works, together with the story of Spanish rule from 1536 to 1706. All three reflect credit not only on their authors, but also on the publishing house of Ulrico Hoepli, which has given them to us in such admirable conditions of paper, type, and illustrations. S. K.

## MONADNOCK AND BEN NEVIS.—II.

London, July, 1894.

The view from Ben Nevis, one of my chief desires in Scotland, was nearly lost by the cloudy and wet weather for which the western coast is notorious. One rainy day was spent very quietly at Fort William, the little town at the head of Loch Linnhe, strung, like its fellows, along the twenty-five-foot beach. The morning of the next day was not encouraging; but it was better to be wet on the mountain than remain another twenty-four hours pent up solitary in a little hotel, so I set forth under lowering clouds, caught several showers of rain and sleet on the mountain path, and reached the summit about eleven o'clock in a dense fog at a temperature close to freezing. This ben being the highest in Scotland, 4,406

feet, and only four miles distant from the sea-level station at Fort William, it was chosen over ten years ago as the site for a meteorological station by the Scottish Meteorological Society, and, largely through the perseverance of Dr. Buchan, funds were collected for making a good bridle-path up the mountain side and a substantial observatory on the summit. Two observers spend their time here, relieved at intervals by changing places with their fellows from the lower station. As the clouds hung low during most of my time on the mountain, I was fortunate in having from Dr. Buchan a letter to the chief observer, Mr. Omond, thus gaining a comfortable seat by his fire in the observatory, while a party of ten or more general visitors tramped about in the heavy snow outside. Although Ben Nevis is not high enough to reach the upper currents of the atmosphere, its records have contributed valuable material concerning the winds at middle levels, and the rate of vertical decrease of temperature in fair and stormy weather—a subject on which the meteorological world is at present divided in opinion. But the large number of days when the mountain is cloudy, about eight out of ten, makes it an exceptionally lonesome station for the observers.

In the middle of the afternoon the clouds fortunately lifted, and allowed an almost clear view on all sides for half an hour. The time was shorter than I could have wished, but it enabled me to scan the horizon carefully and compare its outlines with those more familiar at home. Here the striking contrast between our New England plateau and the Scotch Highlands was made evident. With us, the old lowland was in the first place generally worn so smooth, and in the second place, since its uplift the valleys of the newer cycle of erosion have consumed so small a share of the uplifted mass, that the sky-line of our hill views in southern New England is as a rule characterized by a notable simplicity and evenness. Residual Monadnocks may rise here and there to a greater or less height above the general level; the valleys of the newer cycle of denudation dissect the upland to a moderate degree, but they have not nearly demolished it. The even sky-line of the upland is the dominant feature of broad views in southern New England. In Scotland, on the other hand, the Highlands are comparatively uneven along their sky-line, as if they had never been worn very smooth; and the deep glens dissect the mass so thoroughly that only here and there do any significant stretches of fairly even upland remain. The even-topped Cairngorms, far to the northeast, were the best examples of still preserved uplands in the prospects from Ben Nevis, the altitude of their broad summits being between 3,500 and 4,000 feet. Yet, while the likeness between the two regions is in this respect rather remote, it is so easy to apprehend the essential features of one by its contrasts with those of the other that their differences only enhance the interest of their comparison.

It is manifest that the Highlands, when their whole mass stood much lower than now with respect to sea level, were not reduced to so even a surface as that of the ancient peneplain in southern New England. They were certainly heavily denuded, for their structural disorder is excessive, and they once possessed a much greater mass than now appears; but many small Monadnocks must have stubbornly remained, and an anthropoid traveller at that time would have thought of the region as a hilly district, with open lowland valleys among the hills. It is further manifest that since the elevation of the old hilly lowland into a highland, the carving of the mass by the excavation of the glens beneath the old valley lines has progressed much further than with us. The Highlands are thoroughly dissected; their form is as varied as it can be, and further denudation will tend not to complicate but rather to simplify the surface, by reducing the height of the hills without further increasing the number of the valleys. In New England there are many even uplands remaining, over which the roads may run with small variation of height for miles together. All of our old hill-towns, with their now abandoned farms, were upland settlements. In Scotland the roads are all in the glens, ascending a slope only when climbing to a pass. The little villages are all at the foot of the slopes. The Highlanders do not live *on* but *in* the Highlands; and the strong ridges between the glens kept the old clans apart, except when they gathered to march out to the Lowlands. In a few words, while both southern New England and the Scotch Highlands have suffered two cycles of denudation in the preparation of their present form, the duration of the cycles has been differently apportioned. In southern New England the earlier cycle was far advanced; the later or present cycle is only well entered upon. In Scotland the earlier cycle was somewhat less advanced, but the present cycle has reached its maturity.

An interesting question arises in connection with the dates at which the broad uplifts occurred in the two regions, separating their earlier and later cycles of denudation. It is by the determination of such dates that the age of topographical forms may be measured, and therein lies one of the most interesting advances of geographical study that have been made in recent years. For New England and for much of the Atlantic slope of the United States, it has been shown that the chief uplift, in consequence of which the present valleys have been etched in the elevated lowland, occurred somewhere in the Tertiary division of geological chronology; that is, somewhere in one of the latest chapters of geological time. All the eminences that rise above the upland in which our valleys are sunk are greater or lesser Monadnocks, remnants of the pre-Tertiary cycle of erosion. The deep gorge of the Hudson, for example, in the Highlands of southeastern New York, is thus rationally defined in its relationships. It is a deep and narrow valley of Tertiary erosion in the strongly uplifted, hard-rocked peneplain of pre-Tertiary denudation. The Connecticut valley, already referred to, is of the same date, but it is a broad open valley, a valley lowland, a peneplain of the second generation, because it follows a belt of relatively weak rocks.

The Scotch geologists have determined the age of their glens by an ingenious train of reasoning. The great lava sheets of Mull and the smaller volcanic islands of the western coast are associated with interbedded deposits containing Tertiary fossils. The lava sheets are also associated with a system of numerous dikes that traverse the Highlands for many miles. The dikes run alike over bens and across glens, with no more indication of overflowing their enclosing walls in the valley bottoms than on the mountain tops. Hence the excavation of the glens must be subsequent to the eruption of the lava sheets of Mull; that is, the vast work of the mature dissection of the Highlands is limited to only a part of Tertiary time. To students at home, who are accustomed to measuring Tertiary time by the relatively small deposits of gravels and sands along our Atlantic border, this measure of the Tertiary by the erosion that it has witnessed comes as a surprise. It is indeed difficult on looking at the great gorge of the Hudson or at the numerous glens of the Highlands to believe that even a part of the latest chapter of geological history was long enough for their excavation.

From Ben Nevis, stage and railway carried me northward to a region of the upper western coast that has in recent years attracted much attention from geologists by reason of the new interpretation given to its extraordinary structure. The older views of Murchison, inherited and maintained by the official Survey, were slowly displaced by independent students, of whom the most successful was Lapworth, then a school-teacher in Scotland, now professor of geology at Mason College, Birmingham. It was chiefly from his patient observations that the Government geologists were at last forced to admit the existence of great overthrusts and overturns among the rocks, whereby what should be at the bottom was placed on the top, and the normal sequence of deposits was too often displayed upside-down, or almost inside-out. When the "secret of the Highlands" was thus at last disclosed, and the official Survey was compelled to accept the newer views, a frank avowal of the change was made by the director-general, Sir Archibald Geikie, in an article in *Nature;* and several of the Government geologists have since then been studying out and mapping the region in a most minute manner. Best known of these are Messrs. Peach and Horne, with whom I was so fortunate as to spend two delightful days and nights in the neighborhood of Kinlochewe at the head of Loch Maree; my generous escort being Mr. Cadell, whose experiments at Bo'ness in imitation of the Highland mountain structure have done much to secure acceptance and understanding of the results gained by his colleagues and himself in the field. The weather here was exceptionally clear, and the views from low and high levels were most impressive. Here were old mountains of fundamental gneiss buried in thousands of feet of Torridon sandstones, but now clearly revealed again by the deep excavation of the valleys through the compound mass. Here the old gneiss is clearly seen overriding the Cambrian quartzites, the gently ascending surface up which it was overthrust being clearly displayed in the little ravines that cut across it. Now that the mystery of the structure is solved, any one can understand it, particularly when guided by masters as enthusiastic in explanation as those whom I found.

The account of all this region given by Sir Archibald Geikie, in his excellent book on the 'Scenery in Scotland,' will be found entertaining reading in preparation for a tour through Lowlands and Highlands; but there is one conclusion in the book with which I cannot agree. The denudation which produced the hilly lowland in which the glens have since been eroded, is regarded as having been essentially completed before and during the deposition of the Old Red Sandstone made famous by Hugh Miller's studies in Cromarty Firth and elsewhere. It is manifest that a great denudation of the Highland crystalline rocks took place before and during the deposition of the Old Red, for its beds lie unconformably on the eroded crystallines, and are composed largely or entirely of their fragments. It may well be that the close of Old Red times left the region of the Highlands in the form of a well-denuded peneplain, of small relief, and lying close to the sea level; but inasmuch as the Old Reds have since then been tilted and faulted,

there is every probability that the adjoining peneplain was also deformed. Some later date must therefore be sought for the denudation by which the deformed peneplain of Old Red times was reduced to the hilly lowland in which the glens have at last been cut out.

Returning to the comparison with New England, brief mention may be made of the depression of the dissected Highlands, whereby the lower parts of the glens were drowned, forming the sea-lochs; these being perfectly comparable in kind with many of the indentations of the New England coast, but differing from our examples in intensity of expression. Few places in the world present so bold a combination of land and water as is found northward from Glasgow; yet in spite of the excellent harbors thus developed, there are no cities, not even any large towns, on the western coast of the Highlands—the interior is too poor to support them. The chief places are summer resorts, like Oban. For scenic effect, the region is superb; for ordinary human uses, it is too severe. The gentler modulation of the New England coast, the margin of a habitable interior, is better suited for settlement.

Like the uplift, the dissection, and the depression of the Highlands, its glaciation was of an intense quality. The glens were filled, the summits were overflowed with ice. The rock basins, now holding lakes and ascribed to glacial scouring, are larger than ours. They lie in the troughs of the glens, both above and below present sea level; they add to the interior of the Highlands something of the charm that is given to the border by the long-entering arms of the sea. The moraines or terminal deposits left in the valleys during the later phases of the glacial period are of great distinctness—much more emphatic than any in New England, unless it may be in the White Mountains. Lakes often occur up stream from the moraines, as if due in part at least to the deposit of these barriers; thus Loch Duall is separated from Loch Carron, that enters the main valley from a side glen. All the lakes are more or less encroached upon by the growth of deltas where streams run in from the mountains; the smaller lakes are converted into meadows in this way. It is chiefly on these deltas and meadows, or straths, that the Highlanders built their villages; many of the Gaelic names, like Strath Carron and Achnasheen, show an appreciation of these facts, however little understanding there may have been of the control of the facts. Where the valleys are obstructed by moraines or other drift deposits, the streams are often diverted from their old courses and are now cutting narrow rocky gorges. In New England we have such by the hundred, and nearly every one has determined the site of a mill or a village; but in the Highlands the water-power in the gorges runs to waste.

There is a final comparison that deserves a paragraph. The western or Berkshire plateau, the Connecticut valley lowlands, and the eastern or central plateau of southern New England may with much justice be paralleled with the Highlands, the Lowlands, and the Southern Uplands of Scotland. In both cases the Lowlands are low not because their district was not elevated with the rest of the regions at the time of the general plateau-uplift; they are low because their rocks are weak, and they have almost entirely lost the altitude which the harder rocks on either side so well retain. They are reduced almost to new peneplains. It is on these peneplains that the larger cities are built—New Haven, Meriden, Hartford, Springfield, Holyoke, Northampton, with us; Greenock, Glasgow, Edinburgh, Stirling, Perth, Dundee, in the Scotch Lowlands. In both cases the transition from the rugged country of the Uplands to the open fields of the Lowlands is abrupt, especially on the side of the greater Uplands. When passing across the boundary by rail, the prospect changes like the rapid shifting of scenes on the stage. In both regions the Lowlands are interrupted by resistant lava sheets, now standing up as ridges and retaining much of the height that the Lowlands have lost. Such are the Ochils of Scotland and the Hanging Hills and the other trap ranges of the Connecticut valley. They are Monadnocks of a second generation. In order to enforce the comparison of the two, and at the same time to promote the international exchange of geographical terms, I propose to use Ochils as a generic term for hills of this second class. Let any one ascend Mt. Tom, a strong Ochil, near Northampton, on the Connecticut, and look at the even sky line of the eastern and western plateaus, overtopped by occasional Monadnocks, and separated by the fertile and populous lowlands of the valley. Let him then include in his Scotch tour an ascent of one of the dominating Ochils east of Stirling, and identify in the broad prospect around and beneath him the analogue of every member of his home view; in so doing he will make a good advancing step in comparative physical geography. W. M. D.

# Correspondence.

## DESTRUCTION OF PROPERTY.

To the Editor of The Nation:

Sir: I take it that no country-loving citizen will disagree with the statement of the law as to what constitutes violence in strikes, as laid down by Judge Baker. I as firmly believe that we as liberty-loving people must insist upon the application of the principle of law, not only to labor organizations, but to the transactions of moneyed corporations as well.

We must waken to the fact that it is just as criminal for corporations to destroy capital by wrecking business as it is for the anarchist to do the same thing by applying the torch. To illustrate the point: A man is running an oil refinery. The Standard Oil Company cuts prices so as to lose large sums of money in the territory in which the man who owns the small refinery is selling his product. World-wide markets permit the Standard to make up its loss in that territory by raising the price in localities where there is no competition. The Standard has taxed the people to pay the loss which it sustained in destroying the property of the small refiner. We must, as liberty-loving people, demand that Judge Baker's principles of law be applied to Mr. Rockefeller, and that Mr. Rockefeller be confronted, if need be, by United States bayonets.

It will not do for us to condone the crime of the Standard by saying that such is legitimate competition. There is no competition which is legitimate that does other than as it would be done by. If a law is a just law, it is capable of universal application, and a law to command respect must be impartially enforced.

We shoot the man, and justly, who burns the freight-cars, and pay the loss to the company out of the public treasury. The small refinery is destroyed, and the people pay, not the man for the refinery, but the Standard Oil Company for destroying it, and, to our shame, sing praises to Mr. Rockefeller.

J. S. Stacy.

## FIDELITY REWARDED.

To the Editor of The Nation:

Sir: Apropos of your editorial in No. 1519 ("Praise to Whom Praise is Due"), in which you expressed the opinion that the managers of the Illinois Central Railroad might well "add to a 'vote of thanks' some more substantial recognition of faithful service," permit me to call your attention to the following paragraph from the Richmond *Times* of August 10. W. H. B.

A CORPORATION WITH A SOUL.

Frostburg, Md., August 9.—The Consolidated Coal Company has notified all the miners who stuck to their posts during the recent protracted strike that they will each receive nine months' rent and fuel free.

## THE WORKINGMAN'S LOVE OF HOME.

To the Editor of The Nation:

Sir: Among the benefits arising from the recent railroad strike, I have been especially impressed that it has had a decided tendency to awaken the serious, thinking portion of our people to a realization of their responsibility in the conduct of our government, and to lead them to brush aside many so-called modern ideas, for the time being, and revert to fundamental principles. Your correspondent in the *Nation* of July 26, under the caption of "Pullman and its Inhabitants," uses the following language:

"After years of intimate association with the American workingman, I am convinced that one of the strongest sentiments in his breast is the love of home. When, at the close of a day's toil, he can put on his coat and hat, leave the shop behind him, go home, 'wash up,' and eat supper, smoke his pipe and read the paper or watch the children play or play with them while his wife is 'doing up the dishes'; when he feels that he owns everything about him in fee simple, that he is the boss and master in his own house—that man is happy. When his wife in the back kitchen hums 'Home, Sweet Home,' it is full of kindly meaning to him. Mr. Pullman, in his scheme for a model community for American workingmen, overlooked this peculiar American characteristic."

While this is decidedly to the point in the connection in which it is advanced, it seems to me that, as an argument against the theories of Henry George on Government ownership of land, one more nearly unanswerable would be difficult to find. O. C. B.

San Antonio, Texas, August 4, 1894.

## EARLY AMERICAN POST-OFFICE.

To the Editor of The Nation:

Sir: I should be glad to be informed of any allusion to our American postal service prior to 1775. The official records are nearly all lost. Even the Franklin period is obscure. Yet the subject is interesting, as the history of the post-office is the history of trade and traffic condensed. The early American post-office was among the greatest of all our pioneers. It seems right that the fragments of the early postal service should be gathered. In 1775 we had but four mail routes: the great route along the Atlantic from Portland to Savannah; the route from New York, via Albany and Montreal, to Quebec; the inception of the route from Philadelphia to Pittsburgh; and the ocean route from New York to Falmouth, England. The names of postmasters and

mail-riders or mail-boats, copies of postmarks, and, in fact, the pettiest postal allusion, will be appreciated. C. W. ERNST.

BACK BAY, BOSTON, MASS., August 11, 1894.

M. REINACH AND MR. WALDSTEIN.

TO THE EDITOR OF THE NATION:

SIR: Mr. Waldstein has made two fresh discoveries: first, that I have suspected his *bona fides*, and, second, that, in doing so, my own *fides* has become suspicious. Neither of these discoveries can stand the test of the most lenient criticism.

I *never* contended that Mr. Waldstein had not been the first to publish an observation on the head in the Louvre as belonging to a metope of the Parthenon. I *never* wrote, nor insinuated, that in publishing the aforesaid observation he had any knowledge of his having been anticipated by an unedited *procès-verbal*. It is really trying to my patience that I should be obliged to repeat this. But I wrote in 1886, and I write again, that when M. Waldstein, in 1885, published his 'Essays,' and reprinted therein his paper issued in 1882, he ought to have added a footnote mentioning the following statement of M. Héron de Villefosse, printed in the *Bulletin de la Société des Antiquaires*, 1882, p. 306 (sitting of November 15, 1882):

"En lisant la communication de notre confrère, on pourrait croire que les conservateurs du Louvre n'avaient pas soupçonné l'importance du morceau de sculpture antique dont la place a été déterminée par M. Waldstein. C'est pour faire disparaître toute équivoque à cet égard que je demande à mettre sous les yeux de la Compagnie un extrait du procès-verbal de la séance du comité consultatif. Cette séance est du 22 juillet, 1880, c'est-à-dire antérieure de deux années à la découverte de M. Waldstein. . . . *Une tête d'homme, style des métopes du Parthénon.* . . . Notre confrère M. Heuzey avait été chargé de l'acquisition des marbres grecs dont je viens de donner l'énumération. Le mérite d'une telle œuvre ne pouvait lui échapper: il soupçonne immédiatement que cette tête provenait d'une des métopes du Parthénon."

Now, Mr. Waldstein could have answered, as early as 1886, that the *Bulletin de la Société des Antiquaires* had escaped his notice, and a critic would have proved very pedantic in insisting on so slight a neglect. Instead of that, he began by assuming that I accused him of plagiarism, and called on poor M. de Villefosse to proclaim his innocence, which was questioned by nobody. And now he says that his paper was reprinted before the *Bulletin* had appeared, which seems impossible, the *Bulletin* having reached the libraries in 1883, while the 'Essays' are dated 1885.

If any cool-blooded man will test the facts, he must acknowledge, (1) that I had a right to remind Mr. Waldstein of a point he had neglected to state; (2) that I did so *sine ira*, without throwing the slightest suspicion on Mr. Waldstein's good faith; (3) that Mr. Waldstein flew into a passion about an incidental remark, and now, after eight years, tries to revive a discussion which, in the eye of any reasonable person, bears on a non-existent difficulty.

Mr. Waldstein's first letter concerned the terracotta plaques, which are a serious subject. He there used hard words to qualify the article which I wrote on his 'Essays' in 1885. I felt compelled to show again that what he termed an "unjustifiable attack" was neither an attack nor an unjustified criticism. Whereupon he quite forgets the plaques, and, by inaccurately restating the facts about the head in the Louvre, tries to induce his readers to suspect my scientific honesty.

This is more than enough. I hope Mr. Waldstein will continue to be a felicitous digger, and that I shall have occasion to deal with his discoveries; but, whatever he may say or write about my own doings, I shall abstain, in the future, from entering into any controversy with him. *Fœnum habet in cornu.*

Truly yours, SALOMON REINACH.

MUSÉE DE ST. GERMAIN-EN-LAYE, July 29, 1894.

# Notes.

JOHN FISKE'S 'History of the United States,' for schools, is on the point of issuing from the press of Houghton, Mifflin & Co. It will be remarkable for its bibliographical equipment.

G. P. Putnam's Sons announce, in five volumes, 'The Life and Correspondence of Rufus King,' edited by his grandson, Dr. Charles R. King; 'Cicero and the Fall of the Roman Republic,' by J. L. Strachan Davidson; 'The Story of Venice,' by Alethea Wiel; 'The Flute-Player, and Other Poems,' by Francis Howard Williams; 'Miss Hurd: An Enigma,' by Anna Katharine Green; and 'Found and Lost,' by Mary Putnam-Jacobi.

J. B. Lippincott Co. have in press 'The Marquis de La Fayette in the War of the Revolution,' with some account of the attitude of France towards the War of Independence, by Charlemagne Tower, jr.; 'Henry IV. and the Religious Wars,' by Edward T. Blair; 'Pediatrics: the Hygiene and Medical Treatment of Children,' by Thomas Morgan Rotch, M.D.; 'My First Book,' the experiences of Walter Besant, James Payn and twenty other well-known novelists, edited by Jerome K. Jerome and profusely illustrated; and 'Madonna, and Other Verses,' by Harrison S. Morris.

T. Y. Crowell & Co. will issue in the autumn 'Some Famous Leaders among Men,' by Mrs. Sarah K. Bolton, along with Dumas's 'Monte Cristo,' in two volumes, illustrated by Frank T. Merrill, and 'The Three Musketeers,' illustrated by Maurice Leloir.

Ward, Lock & Bowden will copyright here 'Seven Little Australians,' with illustrations by A. J. Johnson.

Dyrsen & Pfeiffer send us a prospectus of 'L'Art de l'Imprimerie pendant la Renaissance Italienne,' which is to be issued in sumptuous fashion by Ferd. Ongania, Venice. The division will be chronologically by cities, from Rome 1465 to Forli 1495, each city having a volume to itself. There will be in each 96 pages of facsimiles of printers' marks, type, ornaments, bindings, etc., calculated to serve as models of taste to our modern printers and bookmakers. The subscription price per series is 10 francs, or 140 for the whole.

Barras's Memoirs, hitherto unpublished, are to swell the Napoleonic revival in France. They will make four volumes, and will be free from the suspicion of doctoring under which Talleyrand's Memoirs labor.

Since we noticed the first edition of Prof. Edwin J. Houston's 'Dictionary of Electrical Words, Terms and Phrases' (New York: W. J. Johnston Co.), upwards of three years ago, the work has been thoroughly overhauled and much enlarged for a second edition, and now a third is before us, with the new matter added as an appendix. The fourth, the editor assures us, will witness an incorporation of the appendix with the general alphabet. It is gratifying to see such solicitude to perfect a work of reference, and one can but be struck by the extraordinary growth in the terminology of electric science and industry which makes such revision and expansion necessary at such brief intervals. The appendix, like the main text, is helpfully illustrated.

Percy Russell's 'Guide to British and American Novels: being a comprehensive manual of all forms of popular fiction in Great Britain, Australasia, and America from its commencement down to 1893' (London) sadly belies its promising title. It is difficult to prove the hopeless incapacity of the writer without giving the absurd volume more space than it deserves; but perhaps it will suffice to note that in the chapter on "American Novels" there is no mention of Mr. Howells, Mr. Cable, Mr. Crawford, Mrs. Deland, or Miss Wilkins, although in a chapter on "Some Living Novelists, British and American," there is to be discovered this delicious paragraph: "Mr. William Dean Howells (1837) is an American writer, and has published much excellent verse. He is the author of several good fictions."

To the nineteenth volume of MM. Noël and Stoullig's invaluable 'Annales du Théâtre et de la Musique' (Paris: Charpentier; New York: Dyrsen & Pfeiffer), M. Ferdinand Brunetière contributes a preface in which, with his usual precision and acumen, he sets forth briefly his view of the essential element of the drama as distinguished from other forms of literature—the novel, for example, and the epic. This essential quality he finds to be a struggle, a strife between contending elements, an effort of man to free himself from fate, or a rivalry between two opposing men.

M. H. Lafontaine is an excellent actor, and has earned a reputation in his profession which makes his literary efforts interesting. He has tried his hand at novel-writing and on the drama, and in neither line has he yet attained particular success. Although an actor, he does not possess the secret of writing a really strong or live play; as a novelist he is not exactly weak, but mediocre. His last book, 'La jolie Paimpolaise' (Paris: Calmann Lévy), is a proof of this. There is absolutely no point to the story, and when one has finished it one wonders what it is all about. The descriptions of theatrical life are commonplace and uninteresting, although it is in these that M. Lafontaine is most at home. One or two shorter sketches are somewhat better, though still quite third-rate.

M. Adolphe Brisson's 'Portraits Intimes' (Paris: Colin & Cie.) is proof additional of Sarcey's common-sense view of the republication of newspaper articles in book form. The essentially transitory character of such productions militates against their preservation; few newspaper men, writing for next day's issue, can produce articles solid enough to be worth collecting and republishing. M. Brisson's very light sketches do not come within that class, and while there are two or three—on Mounet-Sully, on Irving, on Lemaître—which are interesting, the bulk of the volume is disappointing.

Not so with J.-J. Weiss's 'Le Drame historique et le Drame passionnel' (Paris: Calmann Lévy). His review of the Romantic and realistic plays is thoroughly enjoyable and instructive; his criticisms are keen and to the point; there is solidity in this work and consequent satisfaction for the reader. Very savory is the article on "Ruy Blas," which will be appreciated by every one who saw Mounet-Sully in the title rôle, and who, even under the spell of such splendid acting, could not but be struck by the manifold weaknesses of the play. Every page of Weiss's book more than repays the reading of it.

"Jean Dornis," the authoress of the novel 'La Voie douloureuse,' recently noticed in these columns, turns out to be the pseudonym of Mme. Guillaume Beer, the wife of the counsellor-general of Seine-et-Oise, in whose house Leconte de Lisle recently died.

L. Bernardini's 'La Littérature Scandinave' (Paris: Plon) is chiefly interesting for its accounts of George Brandes, the eminent critic, Strindberg, and Jonas Lie; the article on Brandes being sympathetic and full of information. Those on Björnson and Ibsen are not equal to much else that has already been published about these writers.

Five years ago the prize offered by the united Thierschutzvereine of Germany for the best essay on the rights of animals in their moral and legal relations to man was won by Ignaz Bregenzer, a lawyer of Tübingen, who, instead of printing his dissertation in its original form, subjected it to a thorough revision, and finally expanded it into a volume entitled 'Thier-Ethik' (Bamberg: Buchner). The work, as now issued, is quite exhaustive, and discusses the origin and ethical significance of animal worship and the survivals of this primitive cult in popular superstitions of the present day, animism, monism, metempsychosis, totemism; the teachings of Brahminism, Buddhism, Judaism, Christianity, and Mohammedanism concerning the lower animals; animals in poetry and art and jurisprudence, the influence of the doctrine of evolution upon the treatment of animals, and the rapidly increasing tendency of legislation to recognize them, in both their wild and domestic state, as creatures possessing certain rights and entitled to legal protection in the enjoyment of the same. Vegetarianism Herr Bregenzer regards as "a psychological-pathological outgrowth of modern hyperculture," but goes rather far afield in connecting it historically and genetically with primitive zoolatry and the theory of the transmigration of souls. The vexed question of vivisection is treated dispassionately. Herr Bregenzer thinks that the value of such experiments in promoting the advancement of science, even in the special branch of physiology, has been greatly overestimated, and demands that they should be placed under very strict control. In fact, he would permit such demonstrations only as means of instruction for medical students.

A recent issue (No. 195) of the "Sammlung gemeinverständlicher wissenschaftlicher Vorträge," edited by Virchow and Wattenbach (Hamburg: Richter) is an address 'Über die Zulassung der Frauen zum Studium der Medicin,' by Dr. P. Müller, Professor of Gynecology in the University of Berne, Switzerland, who affirms that for the past twenty years co-education has been practised in all Swiss universities except Bâle, and that, as the result of this experience, he is strongly in favor of the system in its widest application. He declares that the relations of the sexes in these institutions have always been quite as proper as in any other place where men and women are wont to associate, and that the young women have proved to be the peers of the young men in every branch of study, notwithstanding the disadvantages arising from the lack of gymnasia and other secondary schools for their suitable preparation. There are no medical lectures, he thinks, that may not be attended by men and women together with perfect propriety; no medical subject that cannot be investigated thoroughly and delicately in a lady's presence. If some professors are thereby prevented from indulging in equivocal jokes, which are of questionable taste under any circumstances, he does not regret the omission, but deems it highly desirable. What is now most needed is the establishment of fully equipped Mädchen-Gymnasia by private enterprise, unless the State can be compelled to do its duty in this respect.

In a recent number we noticed the first volume of the lectures delivered at Florence in 1893. The second volume has just appeared, 'La Vita Italiana nel Cinquecento: Letteratura' (Milan: Treves), and contains, besides articles by Paoli and Manzoni on the political writers and on the lyric of the sixteenth century, a chapter by Carducci on the 'Orlando Furioso,' interpretative, illuminating, and full of such happy phrases as "Dante remaining to the mass of the people *majestically obscure*," and "Pulci not losing more by his irregularity than an old palace for not having its windows in a line." Add a lecture by Nencioni on Torquato Tasso, more brilliant than profound. Signor Nencioni's remarks on the Reformation are to be described only as "unregenerate," and the Anglo-Saxon reader can but smile at the naming in the same breath of admiration of works like 'Don Juan,' 'The Idylls of the King,' and 'The Ring and the Book.'

After Florence, Venice, Rome, and Milan it would be hard to mention an Italian town where the student of the history of painting can learn so much as at Bergamo. Cariani and Previtali can be studied there alone, and no other one place in the world is so rich in Lottos and Moronis. Besides these masters whose works abound, other artists are represented by at least one authentic specimen, and among these we find of Venetians such names as Giovanni Bellini, Antonello da Messina, Jacopo di Barbari, Mantegna, Crivelli, Bonsignori, Montagna, Basaiti, Catena, Pisanello, Fr. Morone, Caroto, Romanino, and Moretto; of Lombards such as Foppa, Borgognone, Bernardino da Conti, and Gaudenzio Ferrari; of Ferrara-Bolognese such as Cosimo Tura, the Francias, Dosso Dossi, and Garofalo; and of Central Italians such as Pesellino, Botticelli, and Raphael. We are happy to announce that, excepting the Pisanello, the Pesellinos, and the Botticellis, which form part of the Morelli legacy, and have already been photographed by Marcozzi of Milan, all the works at Bergamo of the masters mentioned have just been photographed by R. Lotze of Verona (10 Via Disciplina). The same photographer, by the way, has also done most of the paintings at Verona.

The United Typothetæ of America will hold their eighth annual convention on September 18. *Paper and Press*, Philadelphia, proposes a souvenir number rich in historical matter relating to the printer's art in this country and especially to the recent development of processes of illustrations.

The latest number of Sybel's *Historische Zeitschrift* contains a review of Dr. Quidde's 'Caligula,' by Elimar Klebs of Berlin, who denies that the pamphlet has any value as an historical study, and ascribes its sensational success solely to the covert side-glances cast upon the political conditions of the present day. He accuses Dr. Quidde of having given an imperfect portraiture of Caligula by imparting a modern and therefore false coloring to the statements of Dio Cassius and Suetonius, and by ignoring entirely such important authorities as Philo-Judæus and Josephus, simply because their accounts of the Roman Emperor did not furnish any characteristics suitable to the semi-fictitious personage whom he wished to describe and to present as a warning example to the German people. The critic refers to the recently discovered form of neurasthenia known as "railway-spine," to which conductors, brakemen, and other railroad employees are said to be subject in consequence of exposure to accidents and other constant excitements incident to their occupation. In like manner Dr. Quidde would maintain that sovereigns are peculiarly liable to "paranoia monarchica," a form of insanity induced by their exalted and isolated position, in which they are treated with the reverence due to superior beings, and debarred from all free and natural intercourse with their fellow-men by the rigid constraints of court etiquette. The more absolute the monarch, the more virulent the disease, which has been considerably ameliorated in modern times by the introduction of constitutional limitations to autocratic authority. Whether Dr. Quidde's diagnosis is entitled to any consideration, Herr Klebs will not attempt to decide, but leaves this question to the neuropathologist.

The many friends and pupils of the distinguished archæologist Heinrich Brunn of the University of Munich will learn with regret of his death, which occurred at Josephsthal, near Schliersee, in the Bavarian Highlands, on July 23, after a long illness caused by overwork. He was the son of a clergyman and born at Wörlitz, Anhalt, January 23, 1822. After finishing his studies at Bonn he went to Italy for the purpose of collecting inscriptions for Mommsen and Ritschl, and was secretary of the Prussian Archæological Institute in Rome from 1856 to 1865. He was then appointed to a professorship in the University of Munich, with which he subsequently combined the office of curator of the Glyptothek, or Gallery of Sculpture, in that city. Brunn was generally recognized as one of the greatest authorities in the department of classical archæology. A year ago, as our readers will remember, the fiftieth anniversary of his doctorate was commemorated by American scholars by a gold medal and a Latin address.

—A sense of proportion compels us to confine within a few lines notice of an interesting paper read last year before the Royal Irish Academy and published in vol. iii., third series, of its Proceedings—Capitan Cuellar's 'Narrative of his Adventures in Ireland after the Wreck of the Spanish Armada,' translated and noted by Prof. J. P. O'Reilly. Cuellar was captain of the *Don Pedro*, which, with some twenty other vessels of the Armada, was wrecked on the coast of Ireland in September, 1588. First stripped of everything by the "salvages," he was, like the rest of his companions who escaped the waves and the swords of the British garrisons on the coast, sheltered by the native chieftains. He passed some six months in the island, and eventually by way of Scotland reached Antwerp. Thence, in October of the following year, he indited his narrative to a friend in Spain. "Thinking that, betimes, when you are resting after your meal, you may, for distraction's sake, take to reading this letter, which seems as if it were copied from some book of chivalry; I have, on that account, gone into particulars, in order that you may learn what adventures and trials I had to pass through and undergo." It is the most thrilling narrative of personal adventures of the time in Ireland we remember to have read. The style reminds us of DeFoe. The twenty-five pages are so full of incident it would be difficult to make extracts. The pitiful spectacles connected with the wrecks—the hundreds of brave men in the boiling surf—the

crowds of "dancing and jumping" "salvages" despoiling those who reached land—the putting to the sword of hundreds by the "English Lutherans"—are vividly depicted. We are not likely soon to forget passages such as his finding the bodies of twelve of his countrymen hanging in a ruined chapel where he sought refuge; or those which relate how he and others were glad to cover their nakedness with straw and fern fronds, and how he was made prisoner by a smith and compelled to blow his bellows for several days; or the story of his defence of a castle for a native chief who himself meanwhile retired to the mountains with his flocks and herds. When, after the first few days, nothing further was left upon him to take, he was for the most part treated with kindness. The beauty of the young women "salvages" is often noticed, and the dress and manners and customs of the inhabitants described. Prof. O'Reilly has illustrated the narrative with the suggested identification of persons and localities.

—The rigid tests now applied to the conscripts for the Japanese army have incidentally thrown light upon the ethnology of the island empire. The national habit, continued through ages, of sitting for hours upon the hams and heels has had the curious effect of shortening the legs disproportionately. The average Japanese (man or woman) is normal in the proportions of the upper half of the body. Relatively he is, in the lower half, from a half-inch to an inch and a half too short. It is believed that a more nourishing diet, more exercise, and the use of chairs or some other apparatus which will allow a better circulation of the blood during sedentary attitudes, will in time add to the Japanese stature. Five years' examination of recruits enrolled at the age of twenty shows the following averages: height, 5 ft. 4½ in.; weight, 126.57 lbs.; chest measurement, 32.99 in.; cubic capacity of lungs, 3.531 centimetres. About one-half of the young men rejected on account of disability or deformity suffer from defective vision, hernia, or weak joints. The average rejections per 1,000 are but 41.83, as against 397.43 per 1,000 in England; from which it is argued that the examination is less strict in Japan. Only one conscript in ten is taken, for although fully 200,000 are physically qualified, only 20,000 are enrolled annually for service with the colors. The flower of the population is in the army. Some light seems to be cast by these figures upon Japanese origins. Only 10.46 adult males out of every thousand in the empire attain the maximum height for an infantry recruit. This maximum is 59 5 inches, as against 64 inches in England, 61.6 in Germany, and 60.06 in France. The Coreans are notably taller than the Japanese, and it is on the islands of Tsushima and Iki, in which Corean blood predominates, that the height of the men averages one inch more than on the main island, Hondo. In the regions surrounding the great bays of Yedo and Osaka, as well as in the provinces lining the northwest coast, the people are conspicuously below the requisite standard. The cities as a rule are very deficient in the ratio of height, while the agricultural districts furnish over one-half of the conscripts. It is more than probable that, with the increasing data furnished by the army and navy surgeons, and by life-insurance companies, marked progress may be made towards the solution of the problem of the origins of the mixed people of Japan.

—"Pithecanthropus europæus alalus" is the title of a painting, by Gabriel Max, now exhibited in the International Art Exposition of the Crystal Palace at Munich, Bavaria. It represents the "missing link" and his family, or the domestic life of the primitive semi-human European, not yet endowed with articulate speech, as he may have existed in the pliocene period of the tertiary epoch. Prof. Max is not only an exceedingly clever artist, a genial "soul-painter," as the Germans would call him, gifted with a rare power of portraying on canvas intense emotions of the mind—grief, enthusiasm, the ecstasy of saints and the heroic resignation of martyrs, especially as expressed in the features of women—but he is also well versed in anthropology and comparative anatomy, and perfectly familiar with the results of the latest researches in these branches of science. Among the recent productions of his pencil are several remarkable studies of the anthropoid race, the most striking of which is perhaps the semi-satirical group of Apes as art critics, now in the New Pinakothek at Munich. Unlike these works, the present picture is not a study from nature, but a fancy sketch based upon scientific deductions from the doctrine of evolution. The hands of these pithecoid progenitors of mankind show a marked advance towards humanity in the differentiation from the feet, and the same process of development is perceptible in the growth of the hair on the body and on the head, as well as in the formation of the limbs and the face, which are more rotund in consequence of the increased deposit of adipose tissue. The skull encloses a bigger and better brain, and this variation in the direction of intellectuality is clearly reflected in the thoughtful countenance and the peculiarly sad expression of the eyes. This is especially true of the female, who is seated at the foot of a tree in the virgin forest nursing her infant. A single tear falling upon her left cheek indicates sensibility, and seems prophetic of the fate of her descendants, born to "weep each other's woes." The male, who is standing near, has a mingled look of paternal pride and anxiety for the future. Evidently they are already creatures that "look before and after"; and the appearance of the child gives promise of progressiveness in the next generation. The picture is not for sale, but was presented by the artist to Prof. Ernst Haeckel of Jena, February 16, 1894, on his sixtieth birthday.

—Dr. Luigi Leynardi's 'La Psicologia dell' Arte nella Divina Commedia' (Turin: Loescher) is a diffuse, somewhat superficial, and not particularly original treatise on that most dangerous quicksand of literary criticism, the relation between the mind of the artist and his work. From Dr. Leynardi's elaborate and confusing classification of all Dante's recorded sensations and ideas we gather very little that is positive, though it is by no means certain that a trained investigator would not obtain interesting results from the same field. Two or three points in the book, however, are worth stating, as showing how scientific searchings of this sort sometimes come down at last to the same thesis which the scorned untechnical reader had long held without giving it a basis of statistical proof. Dante affirmed in the most solemn manner the truth of his fantastic journey through the centre of the earth, up the enormous mountain on the other side, and through the heavenly spheres, and many readers have been compelled to admit the paradox that this wholly irrational phantasy makes upon them the exact impression of a true narrative. After several readings of the 'Divine Comedy' it would be easier to convince the imagination that Stanley never saw Africa than that Dante never beheld with his own eyes the City of Dis. The reason, of course, is that Dante's great poem, like most great poems, owes its success to the fact that Dante's expression of what could not have been true was always in terms of what had been his actual sensations. Dante's cavernous underworld seems real, not because it is possible, but because it does not depart from a metamorphosed record of Dante's own precise sensations on the surface of the earth. Dr. Leynardi also appropriately calls attention to Dante's continued unwillingness to attempt the expression of situations or sensations that he thought beyond the range of normal human feeling, evading them by swooning or by some other clever subterfuge. It will be noticed that such occasions increase in number as the poem progresses.

—It is characteristic of the methods and life of to-day that histories of literature conceived on a large scale are usually broken off by the death of the author long before they are completed. Ten Brink and Morley both died at the moment when their self-imposed tasks grew most interesting and most important. The fate of the two great historians of Italian literature has been almost precisely similar. Gaspary, who much resembled Ten Brink in the character and composition of his work, died not long before Ten Brink, and, in the year of Morley's loss, the Italian journals lament the death, on May 16, at Genoa, of Prof. Adolfo Bartoli, who had published seven interesting volumes in his history of Italian literature, bringing the narrative down to Boccaccio. Bartoli was born in 1833, and, though educated as a lawyer, has been for forty years not only deeply engaged in historical and literary studies, but one of the foremost of Italian scholars. Since 1874 he has been professor of the history of Italian literature in the Istituto Superiore at Florence. Bartoli's style was somewhat diffuse, but it was sympathetic and individual, frequently brilliant, and always pleasantly unGermanic in tone and method. His treatment of Dante's life and work was especially interesting, both on account of his wide knowledge of contemporary biography and history, and through the pugnacious and acute scepticism that he brought to bear upon the tangled mass of gossip and information to which scholars had so often given a full and ready credence.

## MR. CONWAY IN THE HIMALAYAS.

*Climbing and Exploration in the Karakoram-Himalayas.* By William Martin Conway. Illustrated by A. D. McCormick. D. Appleton & Co. Pp. 709.

One of the most noteworthy books of the day, which at once attains the dignity of a classic in Alpine literature, is this of Mr. Conway's. The exploration was undertaken during the summer of 1892, at the expense of three English scientific associations—the Royal Geographical Society, the Royal Society, and the British Association. The region traversed by Mr. Conway is within the kingdom of Cashmere, the most northern of the British possessions in India; the Karakoram Mountains lying near or on the boundary between India and the Chinese Empire at this place. The mountain peaks range from 23,000 to 28,000 feet in height, maintaining glaciers of exceedingly great length. The valleys, which have an altitude of from 5,000 to 9,000 feet, support villages some of which are now army stations or forts. But two explorers preceded Mr. Con-

way in this region, the ever active soldier-naturalist, Col. Godwin-Austen, whose researches in zoölogy have made his name a household word among naturalists, and Capt. Younghusband. Neither of these surveys, however, is comparable with that of Mr. Conway in extent or in the value of the results. Of these results, the present volume sets forth the popular portion in the form of a journal of the expedition. The other material, including the natural-history collections, will be discussed by specialists, while the map, for which Mr. Conway made many surveys, will be cared for by the Royal Geographical Society.

The volume before us is the day-by-day record of the expedition, written up each evening from notes made during the day, and is delightful in each of many ways. Mr. Conway is a born explorer, a bright observer with a keen eye for the picturesque, a good naturalist, and he possesses the happy faculty of presenting the interesting phase of his observations. He is a mountaineer acquainted with the Alps and other mountain resorts of Europe, and by many references to these comparatively familiar scenes he is able to convey a very vivid idea of the magnificence of the Himalayas, where, to use his own expression, one is "jaded with appalling splendors of scenery." With the example of Whymper in the Andes as a model, he has had the highest incentive to strong and conscientious work, and of this his volume speaks for itself. The country which he describes is a remarkable one.

"A man coming into a land so new and strange," he says, "is s ricken and overpowered by the impression of the whole. He has no time to contemplate details with the lingering attention that makes the attainment of this or the other point seem desirable. Here was Nature working out her own will unhindered and unhelped by man. The naked skeleton of the world stood forth, with every stratum displayed and every mark of the sculpturing chisel undisguised."

Mr. Conway found himself in the midst of a strange people habitually subservient to their superiors. Did he encounter a group of peasants by the way, they ceased their work, and, with the local salutation, asked what were his commands. If there were none, they begged to be permitted to resume their labor. While they did possess some strong characteristics, personal responsibility and independent opinion were not among them. This is shown by many an amusing incident. When almost in sight of Gilgit, for instance, after inquiry of a native, they realized that he had never seen the fort nor the "Sahib." A second native was met. "Where does the Colonel Sahib live?" "That way." "How far off?" "Not far. A little way." "A mile?" "Yes, a mile." "Perhaps two miles?" "Yes, two miles." "Out with it, man! How many miles?" "As many as the Sahib pleases." Much of the way is through a region of little travel where the high road between the towns is a footpath, and the information about a mountain pass a few miles away is a mere, and misty, tradition. On some of the roads, however, in the compara tively low regions, the party found itself furnished with the local equipage, the "ekka." This is a two-wheeled cart with a flooring about on a level with the tops of the wheels, upon which the traveller squats, being protected from the sun by a sort of dome overhead. The driver has no seat provided for him, but perches wherever he can find room.

"Ekkas are never new, nor is the harness new. The thing seems tied together with string at all points; the strings are always coming loose, and the driver spends most of his time in tying them up. When the wheels come off they have to be tied on with strings wound about the end of the axle. The tires are fastened round the wheels with wooden wedges, which must be kept wet. If they dry, the tire comes off. An ekka horse is a mere anatomy. He is born very old, but he will jog along for ever."

Soon, however, the "ekka" could no longer aid them, and their journey lay along strange pathways, up steep slopes, across rugged glacial moraines, with an occasional rope bridge so tenuous and so "scary" that the travellers were forced on some of them to use the rope as if for ice-work.

Mr. Conway's story of the real ice-work, which forms naturally a very large portion of his volume, will fire the active Alpinist with enthusiasm and make him long to visit this wonderful land of snowy mountains. The trip included eighty-four days spent on snow and ice, the party traversing for the first time from end to end the three longest glaciers in the world outside the Polar regions. These glaciers, the Hispar, the Biafo, and the Baltoro, presented together nearly one hundred and twenty miles of almost continuous ice travel, incidental to which were the different ascents of the higher peaks that overlook the glaciers, and down whose steep ravines come the many tributaries to these great ice rivers. The story is full of charm and interest, but it is related in so modest a manner that, without at least a little experience above the snow-line, one can hardly arrive at a true estimate of the difficulties which were encountered. Mr. Conway must possess remarkable executive ability to have taken so large a party, including many native porters unused to the work and ill-prepared to withstand the rigors of the climate, and with them to have surmounted so successfully the obstacles which he met. For weeks at a time he remained at above 10,000 feet, making frequent dashes with his light party of experienced mountaineers into the higher regions of snow and ice, attaining at one time the summit of Crystal Peak, 19,400, and at another—his crowning achievement—the top of Pioneer Peak at an altitude of very nearly 23,000 feet. On all of these points, the plane-table and the camera were busily at work, and much valuable labor was accomplished which must have been exceedingly irksome at that great height, with the rarefied air and the exhaustion incident to so momentous a climb.

In whatever special matter relating to high ascents the reader may wish information, he will find that Mr. Conway has conscientiously recorded the facts which he has encountered, whether with reference to the nature of the snow and ice, the geological aspect of the country, the fauna and flora, the effects on the climbers of the rarefied air, the best form of portable cooking-stove, the most efficient kind of food, or the most serviceable sort of boots; not neglecting at the same time to note the many charming prospects from the many lofty viewpoints. Nor has his observation been limited to those matters pertaining strictly to the mountains, for he realizes that he is in a country new to the world in general, and he has made his story the more valuable and the more popular by consideration of many other matters of interest, including the architecture of the dwellings and temples, which he views with critical eye, the amusements and occupations of the people, which he lightens with many a quaint bit of conversation, and of course their manners, customs, and costumes and the prominent traits of their character. He picks up in this out-of-the-way place the germ of the "deserted farms" difficulty, which is now attracting so much attention in New England. "Now I want to know," he says, "about your valley. Why are so many fields waste and uncultivated?" "It is because we have so much else to do, carrying wood and things to Gilgit." Truly the elementary principle of concentration of business in cities!

Another bit of political economy comes to us in Mr. Conway's consideration of the valley of Hunza. Through a marvellous system of retaining walls of unpointed, Cyclopean masonry, the steep slope of the valley was centuries ago levelled off into little fields, perhaps a score of them to the acre, the whole tract covering some twenty-five square miles. For the irrigation of this, a canal was led across the face of a precipice, a work which even to the Swiss guide Zurbriggen was a wonder, surpassing in boldness of conception any *Wasserleitung* which he had ever seen. This is the more wonderful since it must have been all constructed by a people who were practically toolless. As a result of this excellent system, the country was well cultivated, "and the population increased to the extreme limits which the land could support. The smallest shrinkage in the food supply brought on famine, and then the only resource was war for the sake of plunder. Hence the Hunzakuts were forced to become a robber tribe. Their very virtues compelled them to it."

A description of the meals at Storage Camp, at a height of 14,210 feet, will be of interest to those who have ever had occasion to lunch or dine in a region of perpetual snow.

"It seemed to be a point of honor with Rahim Ali to feed us best when we were in the worst places. On the 14th of August it snowed all day, so he kept serving us with hot meals and continual supplies of soup or tea at intervals to fill up the time. Where the fresh milk came from I could not discover, unless he had a goat up his sleeve, and the fresh eggs were even more of a mystery. He gave us hot fresh herrings for breakfast, chops and a sweet omelette for lunch, soup, a joint, and scrambled eggs for dinner. He produced each dish with a grin like a conjurer."

But the party was not always blessed with such abundance, for in making the higher passes, with a less numerous retinue, they could not carry such stores, and they found that the bases of supplies upon which they depended were often themselves but badly stocked. On coming down into the camp at Mir, famine nearly overtook them.

"Flour was giving out, and the Raja of Nagyr sent a letter saying that there was none to be had there. The bottom of the tin was visible through our last spoonful of salt. We had at the outside sugar enough for two days, and but six pipes of tobacco. Such was our condition when a *dâk wala* was seen approaching with a box on his back. 'Stores from Gilgit!' was the immediate cry; nor were we disappointed. We prised the box open, and found untold treasures sent to us by that admirable Roberts, whom we fell to blessing in all the languages. Salt, lots of it—sugar, a whole bag—tobacco, and, great Scott! jam!"

Such is Mr. Conway's book, the story of remarkable achievements in mountain-climbing, charmingly presented and of excellent scientific work, clearly stated, with interesting relations of the many novelties which in this strange country impressed themselves upon the traveller. There runs throughout the volume the strong thread of the daily camp-life, with its many incidents and its many bright sketches of the chief members of the party, without a notice of which it would be unjust to dismiss the book. No little interest attaches to the sturdy Bruce, a true English-

man, stout and clear-headed, ever ready in an emergency with his lion's strength and his undaunted courage. To him the fording of a waist-deep raging mountain torrent seemed but a pastime, while the skipping back through a half day's progression for a forgotten tobacco-pouch or some knicknack was but an hour or two of healthful exercise. The excellent Swiss guide, Zurbriggen, mountaineer, philosopher, and jack-of-all-trades, with his quaint phrases and musings, is a strongly drawn character-study, and hardly less interesting are Harkbir, the best of the natives, Rahim Ali, the steward, and the other campers, not forgetting Pristi, the dog. As a character in the story, Mr. McCormick, the artist, bears no small part, but this is absolutely dwarfed by the consideration due him as the illustrator of the book—a place almost as creditable as that of Mr. Conway himself. His sketches add the touch needed to make the story of the Himalayas the more complete, suggesting here the Alps or the Dolomites and there the sharp slopes of the Caucasus, while in their artistic merit they form a fitting counterpart to their literary setting.

## HITTELL'S MENTAL GROWTH OF MANKIND.—II.

*A History of the Mental Growth of Mankind in Ancient Times.* By John S. Hittell. 4 vols. Henry Holt & Co. 1893.

THE chapter on the Ancient Jews, with which the third volume begins, is a curious production. What one expects is a statement, free from animus or *Tendenz*, of the moral, social, and political condition of the Hebrews, as well as a sketch of the development of their religion. The latter would necessitate some words on the latest results of Old Testament criticism, and a definition of the author's position with regard to those results. The scientific historian of culture would discuss these matters as calmly as he would discuss the discovery of logarithms. But Mr. Hittell loses his equanimity as soon as he gets well into any subject which concerns the Christian religion. He has two ends in view in writing the present chapter: one is his proper business, as just defined; the other is, to assail the Hebrew Scriptures. The latter object soon gets complete control of him, and, instead of a scientific appreciation of what the Hebrews have done for civilization, we have a rather violent pamphlet attempting to prove that the Jewish Bible "is a production of natural evolution," and that the Hebrews "never were the exclusive favorites of Heaven by an unjust and insulting preference over other peoples." We cannot conceive why these two propositions should concoct the author's spirits to so fervent a heat, or why he should step aside from his subject to demonstrate their truth. Nobody would have been astonished if he had simply postulated them, leaving argument to those whose vocation it is to deal with Biblical criticism.

The rest, or more than three-fourths, of this third volume is devoted to Greece. In his opening remarks on Early Greece (40 pages) Mr. Hittell holds that in industry, commerce, the practical arts, and originality of religious and scientific systems the Greeks were inferior to other nations, and that their superior political and military institutions formed their contributions to culture. The lack of any hint here at superiority in literature or in natural or educated intelligence is one of the strange omissions constantly to be noted when the author is generalizing. On the latter topic we find little or nothing anywhere, but as regards literature amends are made, so far as one can make them who has not read the original writers, in the special chapter on that subject (40 pages).

Prehistoric Greece and Greek ethnology are very scantily treated. The bibliography appended to the volume does not show that Mr. Hittell has ever read a single one of the many books or articles on excavations in Greek lands, whether on prehistoric or historic sites. He does not seem to set a high enough value on Homer as a document for the early period. To take up a small matter as an example: the first book of the 'Iliad' would have shown him that the king in heroic times was not the interpreter of omens, and that the priest was not always his subordinate. We cannot learn from the bibliography what translation of the epics he used (for, as we have hinted above, Mr. Hittell knows the classics only at second hand), and his reference to the Homeric question makes one doubt whether he really knows what that question is. But the chief fault in this part of the work is the utter absence of the modern comparative method in dealing with the early history of a race. There is hardly a hint that the early Greeks in their manners and customs resembled any other people in the world.

In the first of the Greek chapters the political and military establishments of Sparta are treated, and in the next two (100 pages) those of Athens, Thebes, and Macedon. Here Mr. Hittell is at his best, and gives a plain, succinct, and remarkably accurate account of these departments. But when we come to the Greek religion, we find sad deficiencies again. Out of the thirty pages devoted to this subject one-third are given up to a collection of those famous responses of oracles which "every school-boy knows." This is nearly all beside the subject, and betrays an utter lack of a sense of proportion. There is a fair account of the ordinary practice of religion by private individuals, but next to no attempt to point out the connection between the religious customs of the Greeks and those of earlier nations, and not a word about any influence which they have had upon the religions of later times. No satisfactory treatment is there of the survivals of older and barbarous rites. It is true that Mr. Hittell mentions in passing the occurrence of human sacrifice, but he believes that its occasional appearance was due less to the preservation of an Aryan custom than to the imitation of the rites of contemporary Phœnicians. On the significant "dummy" human sacrifices he has nothing. Ethics, too, is dismissed in a cavalier style, and the author does not seem to be acquainted with Schmidt's great work. The volume ends with short chapters on Industry and on Society.

Without any proper summing up we are hurried in the fourth volume from Greece to Rome. The introduction to the Roman chapters gives three pages to defining the "place" of Rome in the culture of mankind, right enough so far as they go. The greatest part of what follows is naturally devoted to military and legal institutions; for the rest, the method of treatment resembles that employed in the case of Greece. At the end of these chapters, if anywhere, we have a right to expect some general remarks—something about the relations of the Romans to the Etruscans and the Greeks on the one hand, and to the Germans and Celts and other subjugated barbarians on the other—some more elaborate estimate of the value and character of the contribution made by Rome to the "mental growth of mankind." But there is nothing of the sort. The chapter on Roman Society ends with the remark that "Comedians expected to derive more profit from lessons in elocution than from pay given directly for their services on the stage." The next chapter is on Early Christianity, and there is no transition.

This chapter, which closes the book, would be a surprise if the author had not already shown his teeth in the Old Testament diatribe. It opens with a tribute to the civilizing power of Christianity, but soon gets at work on what one is tempted to suspect is, after all, the main purpose of Mr. Hittell's whole book—a violent attack on Christian Evidences. This subject is his King Charles's head, and he cannot keep it out. We have neither time nor patience to follow him through this ill-arranged discussion, much of which is quite impertinent to the purposes of a history of culture. Mr. Hittell believes that Jesus was not a religious teacher, but the leader of a revolt against the Roman Empire which was nipped in the bud. "The theory that Jesus was not a religious teacher, and that, if he delivered any religious discourses, he used them merely as a pretext to conceal his political purpose," Mr. Hittell remarks, "is original with me, and is now published for the first time." This particular blast of the trumpet was not needed. We cannot congratulate Mr. Hittell upon his theory as a theory, nor have we much respect for the logical processes by which he undertakes to establish it. We dare say, however, that his views on Christianity would make an interesting brochure. Our objection to the present chapter lies in the obvious fact that the author has not merely lost sight of the proper purpose of a chapter on early Christianity in a history of culture, but that he has actually forgotten that he is writing such a work. At least, we can find no end to the book *qua* history. This controversial chapter comes to two conclusions, but neither of them can be the proper ending of an historical discourse "on the mental growth of mankind." Indeed, the last sentence of the work rather supports the suspicion that will occur to many, that Mr. Hittell's purpose in writing this book is chiefly to attack supernatural religion. We cannot ourselves make up our minds whether this suspicion is just; but we are inclined to think not. We should rather ascribe the facts that make for it to the author's lack of constructive literary skill.

We have criticised Mr. Hittell's book chiefly with regard to its sufficiency as a general history of culture in ancient times. We have no space to examine the accuracy of the infinity of details which the book necessarily includes. Many of them are drawn, with due credit, from standard works, and are therefore in the main correct, though there is sometimes an uncritical following of the vagaries of an accredited author, and not seldom a failure to check the statements of general treatises by the use of monographs. There are, however, many errors (some of them very gross) in the book, which would seriously interfere with its usefulness even if it were in general well constructed and clear.

On the whole, then, the specialist will not care for Mr. Hittell's lucubrations, and we cannot recommend them to the general reader. The author has considerable ability, and has acquired a respectable stock of miscellaneous information; but he is not qualified in learning, in breadth of mind, or in constructive power to write a satisfactory history of the mental growth of mankind.

*Verona, and Other Lectures.* By John Ruskin, D.C.L., LL.D., with illustrations from drawings by the author. Macmillan & Co. 1894.

It is fortunate that most men's minds are made up about the value of Mr. Ruskin's writings, but it might be matter for curious speculation what would be the effect of the present work upon one who had never read 'Modern Painters' or the 'Stones of Venice,' and knew nothing of their author. It is to be feared that such a reader would be much puzzled as to what to think of such a mixture of qualities and defects. He would not be swept away on a wave of enthusiasm, as so many of us were in the old days of the fifties and sixties. The performance is too slight a one for that; and the conviction all aflame which, in the earlier works, kindled those also who approached it is wanting here—a gentle schoolmasterly dogmatism by no means filling its place. Besides, the times are quite other; the Gothic revival and the Pre-Raphaelite movement are no more, and Carlyle is dead and has been sat upon in judgment. Nevertheless, if the ferment of those years be subsided, it has left some enduring traces on the consensus of educated opinion—some, too (such as the rise in esteem of the painters of the *quattrocento*), calculated to render the reader's disposition towards Mr. Ruskin more favorable. He would otherwise find plenty to admire. The sentences still follow one another in harmonious flow, and their charm is even enhanced by a sobriety that was often lacking in the former dithyrambic pages. Scarlet and amethyst and gold are no longer lavished on the canvas, but the pictures in more delicate tones are not less pleasing than the old splendors.

The book opens with a description of a drive up the hills above Verona that is very beautiful, and no doubt the more so for the reserve that has taken the place of the ancient striving to put into words the inexpressible. A similar change has taken place in the author's opinions. These have lost nothing in force from an increase in temperance that marks them, while his manners, from the same cause, show a decided improvement. The change, in places, amounts to a revolution. The following passage is perhaps the most striking example of what we mean:

"For other pictures of this class, there were two exquisite ones in the Winter Academy—a little Narcissus by Luini, and the Peter Martyr by John Bellini; the last very valuable, because you saw in a moment the main characteristic of the school—that it mattered not in the least to John, and that he doesn't expect it to matter to you, whether people are martyred or not, so long as one can make a pretty gray of their gowns, and a nice white of their sleeves, and infinite decoration of forest leaves behind, and a divine picture at last out of all. Everything in the world was done and made only that it might be rightly painted—that is the true master's creed.

"I used to think all this very wrong once, and that it meant general falseness and hardness of heart, and so on. It means nothing of the kind. It means only that one's whole soul is put into one's work; and that the entire soul so spent is healthy and happy, and cannot vex itself with questions, cares, or pains."

Now that takes all the meaning out of many pages of eloquent denunciation in the writer's former works, but nobody is the worse off for that; and to the new reader there is a decided gain in serenity of view—whatever may be his intimate persuasion with regard to the question of "art for art's sake." But he will be perplexed to reconcile the good things that he finds here and there with their surroundings, or to understand what manner of oracle this is that one moment rises to Delphic heights and the next sinks to the level of a Rosicrucian philosopher. Some of the lectures, as, *e. g.*, that entitled "The Tortoise of Aegina," are entirely of the latter order; but, in general, the main feature is what the French call the *décousu*. The lecturer says just what comes into his head, and, after a half-hour about "Shakspere and the musical glasses," finishes sometimes without even mentioning the subject announced at the beginning. Usually, however, he is not quite so forgetful. In the first lecture, which gives the title to the volume, "Verona and its Rivers," there is, indeed, something about Verona, as well as something about rivers, and—as well as about various other things; involving by the way the confession that Verona has but one river. "Nevertheless, Dante connects its name with that of the Po, when he says," etc., and that is enough for Mr. Ruskin, who immediately proceeds to connect it not only with that of the Po, but also with those of the Adda, the Ticino, the Rhone; and the rest of the lecture is about inundations.

In short, the unsophisticated reader whom we have imagined as taking up the book, would be in doubt twenty times within an hour as to whether the author were a sage or a "crank," but he would always find his pages pleasant reading, and sometimes even good reading. He would thus be in the state of mind in which many of the rest of us are plunged whenever we open a new work of Mr. Ruskin. The volume is illustrated with a number of drawings by the author, two of which are charming, and is furnished by its editor with a preface which is a real aid towards the reading of the subsequent pages, and an index which, for once in a way, seems an absurd luxury.

---

*A Champion of the Cross:* Being the Life of John Henry Hopkins, S.T.D., including extracts from his sermons and writings. By Rev. Charles F. Sweet. James Pott & Co. 1894.

It seems to be the rule of late that biographies shall not be written by those to whom they are at first assigned. Thus, Dr. Hopkins's biography was at first given to his brother, who passed it over to Mr. Sweet because he had undertaken to complete Dr. Hopkins's work on "the history and true meaning of the Seventh General Council." The rational sequence is not evident, and the biographer's fitness for his task is not made so by the event. "I have," he says, "no apologies to make for the carelessness and scrappiness of the work, for I did as well as I could under the circumstances." He could hardly have done worse. The carelessness and scrappiness are such as to make any definite impression, or any appreciation of the sequence of events, almost impossible. Frequently, however, the biographer in his own person is more interesting than the subject of his biography. This is particularly so in his account of the relations of the Episcopal Church to the anti-slavery contest and the civil war. The sternest critics of that church in these relations have never asserted anything more damaging than Mr. Sweet confesses with naïve and generous pride. "Before the war," he says, "slavery issues were easily avoided, because the Low Church minority could not afford to divide its forces, and Massachusetts, South Carolina, Virginia, and Ohio were all in that minority together." "The Church was indeed," he says, "a haven of peace in those days," and in proof of this we have the following paragraph:

"The General Convention met at Richmond in 1859, in the midst of the excitement caused by the John Brown raid at Harper's Ferry, and it was like the rising of a rainbow from the angry storm-clouds menacing the nation, to see one great body of Christians, many of whose laymen were in high places in the State, meeting in the centre of disturbance, and not so much as a word spoken in convention that mentioned the obscene tumult raging all around."

In the same connection we have the history of the resolutions passed by the General Convention in 1862, "a series of resolutions which meant next to nothing," but intended to express the loyalty of the Church to the nation in its darkest hour. "This was the highest political movement that rose in the Church." As editor of the *Church Journal*, Dr. Hopkins took a leading part in opposing this action and all movements which attempted to commit the Church to one side or the other. She must be "neither for God nor for his enemies."

The editor again makes himself prominent and interesting in the concluding pages, where it is narrated that from his dying-bed Dr. Hopkins lifted up his voice in favor of Phillips Brooks's confirmation. What he said is not given, but we have instead an elaborate justification of the course of those who were opposed to Dr. Brooks's elevation to the bishopric. "The growth of the dishonest Broad Church party has," we are told, "become sturdy and vigorous. That they must be cast out of the church which they aim to overturn is evident. It was his known friendship for members of this revolutionary faction and the unmistakable drift of his teachings which caused the opposition to the election of Dr. Brooks to the episcopate." Mr. Sweet "cannot believe that Dr. Brooks was in heart disloyal to the faith notwithstanding his words." "But the episcopate is for the Church, and the evils dreaded have already made their appearance in the increasing vigor of liberalism in the Church." Dr. Hopkins's word for Dr. Brooks entailed the loss of "those monthly intercessions of a society which prays for the souls of clergymen who die in the faith."

The last act of Dr. Hopkins's life was not in harmony with its general course. He was never a Broad Churchman, but a leader of the so-called Catholic party, opposing himself on the one hand to the Low Churchmen, and on the other to the "High and Dry." The Oxford Movement, and later the Ritualistic, found in him the warmest sympathy and an advocacy that did not mince its words. Delighting in controversy, he used the strongest language he could find to express his contempt for his opponents. At the same time he had a warm and generous heart, and he did not understand why those whom he opposed should object to his classification of them with knaves and fools. They objected seriously, and at a critical moment of his life they took their revenge—preventing his confirmation to a lectureship in the General Theological Seminary, to accept which he had given up his rectorship in Pennsylvania. This hurt him more than the Broadway horse-car which knocked him down and caused his death after a long period of suffering.

He was the eldest son of Bishop Hopkins of Vermont, to write whose Life he gave up the *Church Journal*, which he edited from 1853 to 1872. He was extremely versatile: a poet of some merit, a writer of hymns and church music, including a famous carol, "Three Kings of Orient"; a maker of ecclesiastical

symbols and vestments; a designer of church plate and ornament; an authority on church architecture. Ordained a deacon in 1850, he was not made a priest till 1874. Controversy was his meat and drink, and from his biography one learns how sweet and pleasant it is for brethren to dwell together in unity by the spectacle at every turn of quite the opposite development of mutual regards.

---

*Scottish Gypsies under the Stewarts.* By David Macritchie. Edinburgh: David Douglas.

BORROW'S fascinating books were the first to awaken popular interest of a friendly kind in the gypsies, which has resulted lately in the establishment of a "Gypsy Lore Society," regularly issuing in Edinburgh a high-class journal devoted to the enlightenment of the public as to this remarkable race. Mr. Macritchie is one of the editors of this journal, and it is quite apposite that from Scotland, which exceeded other countries in its bitter persecutions of the gypsies, should come in later days the most accurate and broad information as to their true character and the conditions under which they lived.

Although gypsies were known to exist in Scotland much earlier, the first band distinctly visible was in 1505, and the famous family of Faa or Faw was made the subject of a decree banishing George and John Faw and their company from Aberdeen in 1540. It is curious that, only four days before the date of this decree of the bailies of Aberdeen, King James the Fifth, who seemed more friendly to the gypsies than his predecessors, signed a writ in the Privy Council of Scotland relating to John Faw, in which he was treated with partiality and given evidence of the King's friendship. This writ is quoted by Mr. Crockett in his recent delightful book 'The Raiders,' of which John Faw is the hero; and it is also a fact that John Faw was actually in possession of letters under the great seal of Scotland commanding all officers of justice to assist him "in execution of justice upon his company and folk conform to the laws of Egypt and in punishment of all those that rebel against him." The Faa family is still extant.

There have been in Scotland during the last century some gypsy families of light complexion and hair, with light eyes. It is very doubtful if these were true gypsies, as the real Romany blood has almost always proved so strong that even a small admixture of it gives the eyes, features, and complexion of the old and pure race, the same influence that generations of unmixed blood on one side is found to have in crossing the lower animals. One of the most remarkable features of this curious people is that it has preserved for so many centuries, and under such different and often unfavorable conditions, the ancient physical and moral types, as well as the language; so that the gypsy of Spain and Hungary resembles unmistakably his British brother and has a language substantially the same.

The Scottish gypsies, perhaps encouraged by the royal countenance in the writ of 1540, made themselves so obnoxious by their thefts and pillaging that the following year another proclamation was issued against "Jhone Faw and his brether, and Sebastiane Lowlaw Egyptianis," that they "with thair wifis, barnis and companeis," should depart from the realm within thirty days under the pain of death. While this caused the Faws to cross the border temporarily into England, they returned in a few years, and in 1553 "John Faw Lord and Earl of Little Egypt" appears to have been in favor, though his former protector James V. was dead and the country under a regency. At this period and for some time after, the law did not take cognizance of crimes committed by gypsies upon each other, leaving the administration of justice on such offenders to the gypsies themselves. Various interesting instances growing out of this state of affairs are given by Mr. Macritchie, who also tells of a trial in 1612 of several members of the Faw family for different offences. One of them, Katharine by name, pleaded guilty to having slain her husband with a knife, and for this she was sentenced to be "drowned to death in the sea." Her counsel pleaded that "it was not usual to take cognisance of murder among the Egyptians." Up to the present day the right of a gypsy to beat his wife is unquestioned by gypsy women, and is spoken of by them, married and single, as something perfectly proper of infliction for cause. The Scottish gypsies in the sixteenth century also appear to have taken up the profession of strolling players and mountebanks, and in the latter half of it produced several plays at Roslin Castle, one of them being the play of Robin Hood.

A great many enactments were made against the gypsies as such and as thieves and murderers and strong, masterful beggars, and against those who sustained and countenanced them. In 1576 especially an edict was issued, commanding all Egyptians to present themselves at the Tolbooth in Edinburgh to suffer trial and judgment for such crimes as they might be suspected of; such as did not come being considered as thieves and murderers. A trial is recorded wherein one gypsy thief named Alexander Stuart was sentenced to death at Perth in 1701, but his sentence was commuted to perpetual servitude, and he was given as "perpetual servant to Sir John Areskine of Alva." Many fled the kingdom, many were deported to the British plantations in Virginia, Jamaica, and Barbados; many suffered death, and in the records of the Tolbooth, under date of July 10, 1657, "seven Egyptians, men and women, were scourged through Edinburgh and banished the nation," with "certification" given that if they returned, they should be executed. In spite of all these persecutions and punishments, the gypsies continued to survive, becoming somewhat more amenable to the law, but still, up to 1714, the end of the period which the volume covers, harried and pursued by the authorities.

Mr. Macritchie's book is as full of interest and incident as of the results of careful historical research, and it is to be hoped he will continue to publish his investigations of the same subject, bringing them down to the present day.

---

*L'Autriche Contemporaine.* Par Raoul Chélard. [Les Grandes Puissances à la fin du XIXe Siècle.] Paris: Léon Chailley. 1894.

THIS is the first of a series of special treatises on the principal European countries, and deals with Cisleithania only, Hungary being reserved for a separate volume. The author spent more than two years in Austria, and gathered a large amount of varied information, much of it from good sources, concerning the history, geography, political, economic and social condition of the various races of the empire. He has, however, not succeeded in producing an interesting book. The matter is ill-arranged and the treatment often dry. The historical portion predominates to an unconscionable extent, in a work designed to be primarily of contemporaneous interest. Topics relating to France are dwelt upon at great length. Thus, there are thirty pages on the occupation of Vienna by the French in 1805 and 1809, and there is much learned genealogical talk about Austrian noblemen of French descent and the French colony of Vienna, although there are barely 2,500 Frenchmen, all told, in Austria. This want of perspective becomes all the more glaring when we find entire provinces, like Styria and Carinthia, relegated to a footnote, because the author fears to tire his readers with a description of their geographical features. Twenty-two pages are devoted to the struggles of the Czechs against the aggressions of the Germans—as the author views the matter—prior to Maria Theresa, while only a page is given to all the subsequent history of Bohemia, culminating in the erection of the National Theatre at Prague, which called forth "un délire patriotique, une extase, un triomphe, une fièvre, une manifestation du patriotisme comme la France seule en a offert des exemples." Twenty pages are required for "Viennese music," half of that space being taken up with Mozart, possibly because "il est hors de doute que les ancêtres de Mozart étaient d'origine française"; but nineteen lines suffice for a summary of Viennese science, which is rendered all the more grotesque by an attempt to characterize the achievements of the few scientists mentioned: "Meynert, le fondateur de l'anatomie du cerveau"; "Édouard Suess, . . . dont les theories sur la formation des montagnes sont les plus répandues," etc.

Literature in Vienna fares somewhat better, and the sketch of Grillparzer is quite readable, although there is an implied grossness not borne out by the facts in the statement, "Vivant maritalement avec une demoiselle Catherine Froelich, femme d'une grande beauté, et avec laquelle il était officiellement fiancé, et bien que l'aimant tendrement et n'ayant rien à lui reprocher, il ne l'a cependant jamais épousée." But also, in speaking of literary men, the author betrays the irritating pretentiousness of second-hand knowledge. No one who had read a line of Lenau, for instance, could have failed to notice that strain of melancholy which is inseparably connected with his name. But all that M. Chélard has to say of him is: "Quant à son lyrisme, il est plus monotone que celui de Heine, par exemple, mais, par contre, d'un caractère beaucoup plus doux." Occasionally exaggerated statements like "Un Bavarois et un Viennois se comprendront en effet aisément, tandis qu'un Berlinois ne comprendra pas plus un Viennois qu'un Chinois"; or an awkward phrase like "Nous faisons figurer les juifs en tête des races diverses, parce que leur présence en Autriche remonte au temps de Jésus-Christ," show a carelessness unusual in French writers; but, on the other hand, there are fewer misprints than might have been expected in a work of this kind. A number of illustrations, mostly borrowed from Crown Prince Rudolph's work on 'Die Oesterreichisch-Ungarische Monarchie in Wort und Bild,' constitute an attractive feature of the work, which, while not distinguished by the philosophic grasp of a Leroy-Beaulieu or the minute accuracy of a Baedeker, will be found useful by the general reader.

## The Week.

It is quite plain from the tone of Mr. McKinley's utterances that he fears his Presidential prospects have been ruined by the elimination of the tariff as an issue in the next campaign. He cannot reasonably expect that so mild a tariff reduction as the Senate bill contains will bring sufficient ruin upon the country, especially after a period of prolonged depression, to enable him to appeal to the people two years hence in behalf of a higher tariff. The chances are all in favor of a revival of business and industry, which, if it comes, will have the effect of convincing the people that tariff reduction is a good thing. This is clearly the expectation of so competent an observer as Senator Allison, who says that the new bill is "a moderate measure that will do less harm to the industries of the country than the Wilson bill would have done," and that he does not look for future tariff legislation to repeal this bill for a long time. This confirms our view that the Republicans have lost the tariff issue.

---

What remains? First, there is the popular disgust with the Democratic party's incompetence and disregard of its pledges in Congress—what President Cleveland has called its "perfidy and dishonor." This disgust is widespread and deep, and if the year's elections were to be held to-morrow, its effect upon the result could hardly fail to be disastrous to the Democratic party. But if better times come, a great deal of this disgust will wear off between now and November. Our people have short memories in political matters. Then, too, the President is not included in this hostile feeling which exists against members of his party. The Republicans who are quoting his letter to Mr. Wilson are helping to show the country that he was honest and earnest in his course, and that he would have accomplished his wishes but for the opposition of a little group of protectionist Democrats in the Senate. In the Democratic party itself, there is bitter hostility felt against Brice, Gorman, Smith, and Camden, but it is personal to these men, and few Democratic voters will leave their party because these discredited members of it happened to be in control of the Senate, and were thus able to defeat the party's policy and the wishes of the party's President. In other words, the great body of Democratic voters are not going to leave their party because five or six Senators have prevented the party from keeping its pledges.

The President's letter to Chairman Wilson will still be adjudged a huge blunder by all who know no criterion but the event. In a certain sense, that criterion is a fair one to apply to such an innovation in modern American politics. If it succeeded in its immediate and practical aim, it would justify itself; otherwise its wisdom would remain doubtful. But there are other aims than immediate ones and other results than practical ones, and these must be taken into consideration in making up a candid judgment on the President's letter. For a good analogy, go back to his open protest against the election of Murphy to the United States Senate. That was an unprecedented thing, a bold interference with the party leaders and the Legislature. Moreover, it was a thorough failure, practically. Murphy was elected, and the President-elect was humiliated, and his outspoken opposition to the machine was a gross blunder. But was it? Has time proved Mr. Cleveland right or wrong in maintaining that Murphy was not a fit man to represent New York Democrats in the United States Senate? Let the man's senatorial career answer. Does any other State envy New York the possession of a representative whose name has gone through the country covered with ridicule and abhorrence in about equal proportions? Is it a good thing or a bad thing for the President and for the decent members of his party, that he publicly washed his hands in advance of a man who has since shown how easy it is to carry a municipal election by terrorism and murder? There cannot be two opinions about this. The blunder has turned out a most fortunate thing for Mr. Cleveland, his repudiation of the New York Senator having antedated by only a couple of years the emphatic repudiation of that gentleman by the party as a whole.

---

Mr. Cleveland's tariff message of 1887 was another of those bold moves of his which contemporary wisdom made haste to set down as a terrible blunder. It carried him and his party down to defeat. But somehow the blunder worked out a victorious party programme, and the President has a chance in 1894 to sign a bill for free wool for which he pleaded in 1887 in that fatally mistaken message. It is too soon for any one positively to affirm that his letter to Mr. Wilson may not, in like manner, turn out to be simply a blazing in advance the path of his party and the country. But even if it does not, and the letter be considered a failure from a practical or political point of view, personally and morally it is one of those things which do not need to appeal to success for justification. As long as courage and honesty and plain-speaking have a value of their own, apart from results, so long will fair-minded men judge well of the President's exhibition of those virtues in his letter of July 2.

---

Senator Vest fully confirms Chairman Wilson's assertion, that the reason a tariff bill satisfactory to the Democratic party could not be passed is that the Senate is not Democratic. Out of the forty-four nominal Democratic Senators only thirty-eight are real Democrats. The others are, as the Indiana Democratic platform put it, simply "masquerading as Democrats" to serve their own private gain. This raises in its most serious form, for the Democrats, the whole question of government by party. We have heard a great deal of the evils of party government, but none of them can ever be so great, under present conditions, as the entire breaking down of party government. If the instrument of party, taken in hand by a majority of voters to accomplish their will, breaks in two in their hands, then they will have to devise some new way of getting what they want done. Their first move, of course, will be to try the party which has not broken in two. If that one goes the same way, then they will have to set their wits to work to invent some new way of governing. It follows that the first duty of the Democratic party is to reconstruct itself into a weapon that will hold together. The Indiana platform has made a good beginning in practically reading out of the party the men who have betrayed it. This should be followed up in all the State and congressional conventions to come. Such action cannot even diminish the present chances of Democratic success in the fall elections. Without it the Democratic party will remain hopelessly discredited for years to come.

---

We gladly welcome Senator Vest to the ranks of the civil-service reformers. In his speech last week he showed that he has become completely disgusted with the methods inseparable from the spoils system, and that he has learned by experience the great gain which comes to a public man when he is relieved from this humiliating servitude. Defending himself from the charge that he had private grievances against the President, Mr. Vest said:

"I wish to acknowledge, in the most public manner, my gratitude to the President for having relieved me from all responsibility in regard to appointments in Missouri. If there is anything in my public life which has afforded me any pleasure, real and substantial, it has been the fact that the President, in the exercise of his constitutional right, of which I do not complain, informed me that he no longer desired my advice in regard to Missouri

patronage. Not again during this administration will I stand in a crowded anteroom looking into the anxious and haggard faces of expectant office-holders. Not again will I be admitted in the august presence, nor will I watch the shadows—possibly produced by indigestion—that flit across the executive brow, and feel my heart sink as each shadow comes and goes. Not again will I be damned at country post-offices, upon village corners, as an ingrate who has given no offices to his friends."

Now that he has been released from all the troubles and complications involved in dispensing the spoils, Mr. Vest says that he can "fight for my principle, my party, my country," and he evidently enjoys the privilege. It is a great thing to get such a tribute to the advantages of civil-service reform from a veteran politician.

---

The income tax has been so beaten about and amended during its passage through Congress that the public are naturally at a loss to know what its exact terms and effect will be. Its main features may be briefly stated. On personal incomes it is a tax of 2 per cent. on all amounts above $4,000. The tax is to be levied on and after January 1, 1895, and is to be payable on or before the first day of July, 1895. It is to be assessed on the income received "in the preceding calendar year"—that is, for the first levy, the calendar year of 1894. If the tax is not paid on or before July 1, a penalty of 5 per cent. on the amount unpaid, with interest at 1 per cent. a month, will be levied in addition. The law specifies a great many things that shall be reckoned in, in making up the annual income: profits in business, interest on notes, bonds, and other securities, money and personal property acquired by gift or inheritance, salaries. It also specifies many deductions that are to be made—"necessary expenses" in carrying on business, interest due or paid, State and local taxes, "losses sustained," worthless debts, dividends received from corporations which themselves pay an income tax. All persons having an income of more than $3,500 a year, must make a return to the collector. The corporation tax is likewise of 2 per cent. on net profits or income, payable at the same time and for the same period as the individual tax. Exemption is made of charitable and religious corporations, savings banks (under certain limitations), building and loan associations, and fraternal and mutual insurance associations. As in the case of the individual tax, the law goes into many details as to what shall be counted in as net profits and what deductions may be made. The law is to remain in force five years, unless extended, and doubtless within that time there will come to be a whole library of decisions on the disputed points of the intricate and, in many sections, confusing measure. We may note finally the estimate of the chief of the Bureau of Statistics, that the returns from individual incomes will be small, barely covering the cost of collection, but that the revenue derived from corporations may be expected to amount to anywhere from $12,000,000 to $39,000,000 yearly.

---

The Trenton potters are ruined again. We suspected it. They are always being ruined by the tariff. If it is put up on their wares they are ruined, if it is put down they are ruined, and if it is let alone they are ruined. McKinley raised their protection by 7 per cent., and the blow was so deadly that they straightway went home and reduced wages 22 per cent. Then about eleven months ago they found that they were ruined again, and reduced wages 30 per cent. more. The operatives struck, and remained idle while the potters in the Trust were working off their stocks at monopoly prices, until last July, when a solemn agreement was signed at Washington between men and masters that a reduction of 12½ per cent. in wages should go into effect for "twelve months from July 11, 1894." In this agreement nothing was said about the tariff, and both parties to it denied that there was any compact bearing on the change of the tariff. Now, however, one manufacturer asserts that there was a tacit understanding on both sides that Senator Smith was to shove up the duties by 30 per cent. The reason why this was not put in the agreement, says this innocent manufacturer, is "obvious": "Neither Senator Smith nor any member of either committee wished to put in writing that he had agreed to make the duty on crockery 40 and 45 per cent., because that might prevent what we all so much desired to accomplish." Anyhow, agreement or no agreement, the potters know when they are ruined, and ruined they are again by the new tariff. Wages have got to come down 12½ per cent. more. But, as the *Tribune's* special from Trenton informs us, wages under the McKinley tariff had to come down 30 per cent., which would seem to leave the new tariff several points ahead.

---

Whenever there is a great labor disturbance, there is sure to be a demand for some new law to regulate the relations between employers and employed. The Michigan Republicans at their recent convention demanded the enactment of a law to carry out the provision of the State Constitution, adopted forty years ago, which provides for the establishment of courts of conciliation, with such powers and duties as shall be prescribed by law. There does not seem to have been a delegate in the convention who supposed that anything had ever been done by the Legislature in the way of carrying out this provision of the Constitution, but a mousing newspaper man has discovered that the Legislature of 1889 passed a law providing for "the amicable adjustment of grievances and disputes that may arise between employers and employees, and to authorize the creation of State courts of mediation and arbitration." The measure was, however, so severely amended during its passage that the word "may" was substituted for the word "shall" in the directions to the Governor about appointing the members of the proposed court, and no executive has used the discretion given him. Indeed, it is probable that, if the judges had been appointed, they would have had no real power, and their decisions would have been binding on nobody. The incident shows the carelessness with which lawmakers generally act when they conclude to "do something" in the interest of "labor."

---

For pure and unadulterated nonsense the labor plank of the Iowa Republican platform may defy competition. Here it is:

> "The welfare of the laborer and the maintenance of the dignity of labor have been the constant care of the Republican party from its birth. Its whole history is an effort to secure to the wage-worker his just share of the fruits of toil, and it now renews its pledges to defend the workingman not only against the assaults of foreign competition, but against the attacks of domestic avarice."

This resolution was adopted while the Debs rebellion was fresh in the public mind; indeed, the meeting of the convention had to be postponed because of the interruption of railroad communication caused by this rebellion. But not a word was said about any of the issues involved in that outbreak; not even a censure of the lawlessness which had caused the postponement of the convention. Instead of something clear and positive, there was constructed this singular "pledge" to defend the workingman. Nobody attempted to explain what it meant, but "labor" will be urged to vote the ticket on the ground that it has been promised something.

---

The great strike at Chicago has already so completely passed into history that it is doubtful if many people read the testimony given before the Government commission of investigation. Very probably no new light will be thrown upon the affair by this testimony, but there are occasional gleams from it deserving attention. Mr. Debs was epigrammatic in his reply to Commissioner Kernan's question as to what remedy was possible for labor troubles. "A Government ownership of railroads was better than a railroad ownership of Government." He was also safe in declaring that Government ownership of railroads would not result in much benefit to the laboring classes. It is suggestive to learn that he attributes the failure of the strike, not to

the appearance of the United States army, but to the action of the courts. This, he says, prevented him and his associates from issuing their orders and demoralized their followers. Doubtless there is a good deal of truth in this, but it would be difficult to disentangle the effects of the two causes. For his own part, Mr. Debs declares, he did not bring on the strikes, although he supported them loyally after they had been ordered by the Union, and he expresses the optimistic conviction that the Union is now stronger than ever. Nothing is further from the purposes of this body, it seems, than violence; and such expressions as "buy a gun" are to be taken in a purely Pickwickian sense. The use of "playful expressions" of this kind, however, when large numbers of men are on strike and ready for riot, is an indiscretion very much like lighting a pipe in the vicinity of a powder magazine. The intention of an act is properly to be inferred from its usual and natural consequences.

---

The overthrow of the Milholland faction has had the beneficial effect of removing the "straight-ticket" danger almost entirely from the local political field. At no previous time has the prospect for a harmonious agreement of all anti-Tammany elements upon a non-partisan ticket been brighter than it is to-day. An excellent spirit has pervaded all the recent conferences which have been held; the hearty declaration of the German Reform Union that, in the selection of candidates, national party claims should be disregarded, and capacity, honesty, and character made the sole requirements, being typical of the feeling which pervades all the participating organizations. The plan followed with such good results in Brooklyn before Mr. Schieren's nomination is being imitated as closely as possible. Under that, it will be remembered, a conference was held between a committee representing the Republican organization and committees representing four other anti-McLaughlin organizations, at which a list of names of candidates for mayor was agreed upon. This list was submitted to the Republican city convention, and the second name upon it, that of Mr. Schieren, was taken by the convention as its candidate. All the other organizations thereupon gave their formal approval, and Mr. Schieren became the anti-ring candidate. There was no partisanship whatever in the choice, and the union of all opposing elements was made possible because each was willing to sacrifice its personal prominence and become merely a factor in the movement.

---

After the tearful interest of the Republicans in Hawaii, it was only natural that a Republican party should be organized in those isles of the blest. That solemn event took place on July 30, and a platform of twenty-two mortal planks was adopted. One of them, of course, declared for annexation, so that Hawaiian Republicanism might blend with our own. That the blending is not to be done from the other direction, however, is clear from that plank which "strenuously opposes the importation of persons from abroad to fill Government positions so long as there are loyal residents of the republic competent to occupy them." Thus it appears that there will be no opportunity for our decayed Republican statesmen to go to Hawaii and grow up with the offices. Other planks of the Hawaiian Republicans "favor a graduated income tax," "advocate the perpetuation of systems of public works in order that the surplus labor population, except Asiatics, may be afforded employment," and "demand the repeal of the obnoxious and iniquitous Sunday law." We see no reason why, after this profession of political faith, two delegates from Hawaii should not be admitted to the next Republican national convention.

---

The London *Economist* of August 11 has an article on the wheat harvest of 1894, taking into consideration the crops of Europe and America only. It finds a very bountiful harvest in the United Kingdom, but on a diminished acreage, so that the total yield will be only 6,000,000 bushels greater than last year. The French harvest is unusually large, say 320,000,000 bushels in all. In Spain, Portugal, Italy, Germany, Holland, and Belgium there is a considerable gain over last year. In Austria-Hungary and the neighboring countries there is a considerable deficiency as compared with last year, and the same may perhaps be said of Russia also, but the reports from the latter country are conflicting. The harvest of the United States is put somewhere between 400,000,000 and 475,000,000 bushels. The conclusion of the *Economist* is that "both Europe and America will probably produce less than the quantities grown in 1893; but unless other parts of the world fall off greatly, the total production can hardly fall below a year's consumption, while there are still remnants of the great accumulations of the last three years to clear off, so that there is nothing at present to indicate any substantial improvement in the price of wheat."

---

We have referred to the way the socialists in Roubaix and Saint-Denis have had a free course and been glorified and got those municipalities deeply into debt. Reports from other French cities where the socialists are in control show a similar state of affairs, and make it clear that, for taxpayers, it is not only the first step in practical socialism which costs, but every succeeding step as well. Some municipal councils now in socialistic hands are restrained by the veto of the prefects on their making free with public money. This is the case in Paris, where the Prefect of the Seine has for years been disallowing the appropriations of the Council. About the only thing the Paris socialists have finally got by him is their bill to raise their own salaries, which are now fixed at $1,200 a year. This is the way they carry out their professed determination to "reduce the pay of municipal officers to the maximum earnings of workingmen." Perpignan has been having a delightful experience with its socialistic municipal council. When it came into power it found a surplus of $25,000. After four years it went out leaving a deficit of $120,000 and the city bankrupt. Examination of accounts showed vast sums spent by the councillors on costly furniture for the public buildings, on punch and cigars for their official consumption, and on journeys made by them here and there to confer with other socialists as to the best way of spending public funds. Somewhat similar experiences have been had in Saint-Ouen, Lyons, and Marseilles. They give point to the growing conviction of the world that socialism may be very fine, but that it comes high.

---

A curious case growing out of the Chilian war has just been decided in England by the Court of Appeal. The Chilian Government sued the London and River Plate Bank for the return of 338 bars of silver deposited with it by Balmaceda as security for advances made him by the bank. Some $40,000 was advanced on the bullion in July, 1891, and as to this the Chilian Government makes no complaint; but on August 29, a further sum of $530,000 was advanced, and this, the plaintiffs averred, should be set aside, inasmuch as Balmaceda had been defeated on August 28, and had definitely resigned by 12:30 on August 29. The point was that his Government had ceased to be even *de facto* when the money was advanced, and that the bank should have known that the silver really belonged to the successful revolutionists. But it was rejoined that the bank had no certain or official knowledge of the fall of Balmaceda, and, if the rumor of his collapse had proved false, would have been liable in enormous damages for failing to live up to its contract with him. This view was sustained by the court and the case was dismissed. The Master of the Rolls laid down the doctrine that you do not need to ascertain the constitutional warrant of a *de facto* government before doing business with it.

*THE PRINCIPAL TARIFF CHANGES.*

THE most important change in the new tariff is that relating to wool and woollen goods, by which the raw material is made free and the duties on the manufactured articles are reduced to 30 per cent. on yarns, 40 per cent. on cloths, and 45 per cent. on dress goods. The reduction on these articles is chiefly in the specific rates, or pound duties so called, which were imposed to offset the duties on wool. These pound duties were in some cases very onerous, ranging from 16½ cents on blankets to 60 cents on dress trimmings and on the higher grades of carpets. The theory upon which the pound duties were laid was that it takes, for example, four pounds of raw wool to make one pound of cloth; that is, the duties were compensatory. When the Wilson bill came up, the manufacturers who had the making of the McKinley bill, confessed, or rather insisted, that they had "stretched the truth" when they said that the pound duties were no more than a compensation for the duties on raw wool. They now claimed that the pound duties as well as the ad-valorem duties were protective (and necessary of course), and they made their own former untruths the basis of a demand that the woollen duties should be increased over and above the compensatory line of the McKinley bill, and they actually prevailed on the Senate to raise them 5 per cent. above the Wilson bill as a reward for their previous dishonest behavior. This, however, can be overlooked now, or relegated to the tomb which contains so many other tariff deceptions and robberies. The relief to the public from the abolition of these pound duties will be very great. The new schedule of woollen manufactures does not go into effect till the first of January, 1895, but the wool schedule takes effect immediately.

Next in importance to wool and woollens are the schedules of china and glassware, which are reduced from 55 and 60 per cent. to 30 and 35 per cent. Of course there is a great outcry on this subject from the protected interests, and they all talk of going out of business, just as the quinine-makers did when Congress put that article on the free list. It is a sufficient answer to the makers of china and glassware that any trade which cannot be carried on in this country with a tax of 30 per cent. levied on the consumer for its benefit ought to be abolished. There is no danger, however of their going out of business permanently.

The next most important thing in the list is tin plates. The increase of tax on this article was perhaps the greatest outrage in the McKinley bill. The duty on tin plates in the tariff of 1883 was one cent a pound, being equal to 35 per cent. ad valorem. McKinley raised it to 2 1-5 cents per pound, or 78 per cent. ad valorem. It is now reduced one cent per pound, *i. e.*, it is put at 1 1-5 cents, which is equal to 42 per cent. ad valorem. Here we may repeat that an industry which cannot be carried on by taxing all the consumers of canned goods and all the buyers of tin pans, pails, and dippers 42 cents on each dollar's worth, is a detriment to the country and ought to be abolished.

A more brazen although less important item in the McKinley bill than the tin-plate tax was the duty on pearl buttons, which was raised from 25 per cent. to 143 per cent. average. As to some varieties and sizes it was much higher, being about 1,000 per cent. This swindle was accomplished by cunning phraseology that common people could not understand. The McKinley duty was "2½ cents per line and 25 per cent." It is to be regretted that the duty was not put back to the old rate of 25 per cent. It stands in the new bill at 1 cent per line and 15 per cent., which is equal to 84½ per cent. ad valorem.

Linseed oil was monopolized by a Trust as soon as the McKinley bill was passed, the duty being increased from 25 cents to 32 cents per gallon. It is now reduced to 20 cents per gallon. Castor oil was also put into a Trust, the duty being 80 cents per gallon. It is now reduced to 35 cents.

Flax, hemp, grain bags, cotton bagging and burlaps are on the free list. This is a very important change.

Sulphuric acid, the most important chemical agent employed in manufacturing industry, is restored to the free list, McKinley having taxed it ¼ cent per pound. Bichromate of potash, another indispensable agent of manufacturing industry, which has always been a close monopoly in this country, is reduced from 3 cents per pound (about 32 per cent.) to 25 per cent. This article ought to have been put on the free list.

Lumber is at last put on the free list.

The duties on white lead, pig lead, cutlery, gloves, and nearly all the miscellaneous articles have been materially reduced. The reduction on iron and steel, although seeming to be considerable, is really no reduction except on certain specialties, being prohibitory even at the lower rates now adopted. This is the case with pig-iron and steel rails.

The reciprocity clause of the McKinley act is repealed, but the "reciprocal commercial arrangements heretofore made" are kept in force, "except where such arrangements are inconsistent with the provisions of this act." Therefore, upon the signing of the bill by the President, the retaliatory duties against Venezuela, Hayti, and Colombia which were established by President Harrison's proclamation, are abrogated. This is important as regards the "mild coffee" produced by those countries, which is now dutiable at three cents per pound.

Good all through, and with no "ifs or buts" about it, is the clause placing works of art on the free list. The spectacle presented to other civilized nations by the United States clinging to its barbarous tax on educational and refining influences in the shape of pictures and statuary, has been about as anomalous as that of a man with a war-club at a garden party. One Congress after another has met and adjourned without getting rid of this tax, though free-art clauses have been introduced in several of the tariff bills. Indifference on the part of the general body of legislators has been more of a factor, perhaps, than active opposition, in the defeat of repeal, but this time the measure seems to have found friends in the committees of both houses and in the debates on the floor as well. The American artists who desired to be exempt from this offensive sort of "protection" and have kept up an active war on the tax, are to be congratulated on the successful outcome of their labors, and the general public on a step increasing their respect for art and their reputation for intelligence at the same time.

*GOV. RUSSELL ON STATE CONSTITUTIONS.*

EX-GOVERNOR RUSSELL of Massachusetts, in his address before the graduating class of the Yale Law School, has set forth his own views as to what a constitution should be and as to what a constitution should not be. The Constitution of the United States, it is almost needless to say, is a constitution as it should be. "In less than thirty words," says Governor Russell, "it created our whole national judicial system." By "eight words" it established our admiralty and maritime jurisdiction, which, "by magnificent judicial evolution," has broadened the original English idea, until jurisdiction extends "from the ebb and flow of the tide so as to cover every league of navigable water within our continental domain." The system of "comprehensive general principles and broad powers, sufficiently elastic to allow of expansion by proper construction, yet sufficiently distinct to be effective and protective, has stood the test of more than a hundred years, has carried us through foreign wars and civil conflict, has adequately met a phenomenal increase of population, wealth, and area with its new and momentous questions, has skilfully adjusted the delicate relations between State and nation, and governed as efficiently 70,000,000 of people scattered through forty-four States, reaching from ocean to ocean, as the small population of the narrow coast line which embraced its thirteen original constituents." Governor Russell also triumphantly quotes Mr. Dicey, when speaking of the sovereign power established by the Consti-

tution: "It needed the thunder of civil war to break his repose, and it may be doubted whether anything short of impending revolution will ever again arouse him to activity."

Substantially every recent constitution framed in a Southern or Western state is manifestly, in Gov. Russell's opinion, what a constitution should not be. The masterful power of enunciating great principles in few words certainly seems to have passed away as completely as if 500 years had intervened—as if the recent constitutions were written in a new language—as if the framers of 1787 were old Romans and the framers of to-day modern Italians. As far back as 1848, the Constitution of Illinois increased in volume "in the ratio of eight to eighteen," in 1875, the Constitution of Missouri "in the ratio of eleven to thirty-one"; in 1891, the Constitution of Mississippi became "almost a code of laws," containing 285 sections and covering 47 pages. There is no administrative detail too petty for the constitutional delegate to try his hand at; and the controlling idea of our little constitution-makers manifestly is that when they get a chance to manage matters, they must fix them to suit themselves and trust nobody—not the Legislature, not the judiciary, not even the people whom they extol as the fountain of political wisdom. In one of the new States there are *ninety* prohibitions "upon the Legislature in the single matter of special legislation"; in another, the Constitution "even fixes the time within which a judge must render his decision"; in North Dakota, it requires the Supreme Court of the State to do the work of the reporter, "to prepare a syllabus of the points adjudicated in each case."

That is to say, the small minds which get control of a convention seize their opportunity to "run a State," as politicians would term it, for the next twenty or thirty years, and by so doing undermine the healthy American principle of self-government and civic responsibility. Gov. Russell's philosophical comment is: "By the creation of important administrative boards and by the many restrictions on the legislative, executive, and judicial departments, the tendency of these constitutions is to establish a sort of automatic permanent administration as a substitute for our usual form of government." Or, as Chief-Justice Cooley has said to some of these constitution-makers, "In your constitution you are tying the hands of the people." Story admonished us more than half a century ago, "The rage of theorists to make constitutions a vehicle for the conveyance of their own crude and visionary aphorisms of government requires to be guarded against with the most unceasing vigilance." The constitutions which have followed his warning vindicate his foresight.

In addition to the egotists who think that they can legislate for the future with greater wisdom than any legislators whom the people may hereafter select, there are the demagogues of the day, always afraid of the unpopular, and ready to advocate any favorite measure of the hour. Hotels, theatres, express companies, the telephone, the sleeping-car, the telegraph, the railroad, become suddenly subjects of constitutional law. The amendment at Albany, prepared by the labor unions, which is intended to prevent the employment of convicts at remunerative work in the State prisons, is a specimen of this. Prisons and prison reform still furnish one of the unsettled problems of our present civilization. Social science is still wrestling with the subject. Humanity demands that the convict shall be given a reasonable chance to amend his life and become a useful and self-supporting member of society. Economics require that the cost of reformation shall not be too great, that the expenses of the prison system be kept within reasonable limits, and that the convict shall be, if possible, self-supporting. How and to what extent this can be best accomplished is still a question—a question which is receiving the careful consideration of some of the best and most philanthropic minds in the world. Yet at this point there comes a band, or many bands, of monopolists having a corner, or trying to have a corner, in the skilled-labor market. What they want is the exclusion of everybody whose labor will compete with their own, *i. e.*, with their kind of labor. They introduce the legislative lobby into a body of men who have no right to legislate upon any subject, and they do this to procure legislation for themselves—legislation which will help their monopoly for many years to come.

A provision to prescribe and restrict the future management of a prison is manifestly an attempt to control the future—an attempt to dictate a policy, and tell succeeding legislators and perhaps generations what they must and what they must not do. Concerning this element of control, Governor Russell most aptly says:

> "True, the control may be of a majority, not a king; but the vital question is not its source, but its extent. If it prevents the people from asserting their will, if it continues the reign of a departed majority, it is not in accord with the principles and institutions of our liberty-loving, self-governing people."

The primary purpose of a constitution is to create and define a government; its next is to secure personal and political rights and establish a few of the great and fundamental principles of government, such as, "No title of nobility shall be granted," "Congress shall make no law respecting an establishment of religion." All of these, it is true, are restrictions upon legislation and upon the people who elect the legislators. But they are more than restrictions: they are fundamental assurances and guarantees of great and important rights. The right of trial by jury is a right affecting the individual; the prohibition as to titles of nobility is an assurance to all men that all men in this country shall be politically equal; the restriction concerning an "establishment of religion" assures the minority of religious persons that they shall not be forced by the majority to support a state church. Such restrictions go to the character of a government, and not to its policy. They are organic and are intended to be immutable, as much so as that "the United States shall guarantee to every State in this Union a republican form of government." Their abiding purpose is to guard the minority and the individual, and to assure to all men constitutional rights and liberties which a transitory majority cannot invade.

To these may be added certain restrictions upon the administrative forces of government—the legislative, the executive, and the judicial. But such restrictions must extend no further than these administrative agencies; that is, they must not bind the principal, the body politic. The convention, for the better security of the people, may tell future legislatures how they must work, but not what they must do. It is within the proper scope of a constitution to prescribe that the enactment of a law shall be only by yeas and nays, which shall be entered on the journal; for this secures to the body politic proper administrative action where a statute would not bind the law-making power, and regulates legislation by something better than legislative rules. But it is not within the proper scope of a constitution to prescribe that the yeas and nays shall be taken *viva voce*, and not by an electric instrument which would enable each member to print his own name and vote on the roll, and all the members of a house to vote simultaneously. A constitution may require three several readings of a bill, and that these readings be on different days, and that the title of a private bill correctly set forth its object; or it may go further and follow the English parliamentary practice of requiring a preamble which shall fully declare the nature and extent of the claim, and the intended scope and purpose of the bill, and it may provide that in construing such statutes the preamble shall limit the effect of the enacting clauses; for all such restrictions are in furtherance of honest legislation, and neither "tie the hands of the people" nor "continue the reign of a departed majority." In only one instance, the election of the President, did the Constitution of the United States descend to administrative detail,

and within a score of years that provision had to be amended.

Distrust is the enemy of republicanism. If men cannot trust each other, and if society cannot trust itself, there cannot long be a republic. In 1787 the public distrust was sectional and monarchical: one State could not trust the other States, and the distrustful part of society could not trust anything that even looked like the abjured monarchy. The framers of the Constitution treated the case heroically, and in time compelled the people of the United States, no matter how far apart they might chance to live, to trust each other. These Southern and Western constitutions which Gov. Russell condemns are overwhelming evidences of distrust, and of a distrust which is of the most dangerous kind. They show that society in those States does not trust itself in the selection of its own legislative representatives; that society, though it does not say to a king, "Come and rule over us," does say to a convention, "Come and take care of us; we have weakened; we have not the power of self-government which our fathers had; we belong to the servile races, and are incapable of taking care of ourselves." It is not unlikely that some future historian, after a careful study of American States and State communities and State constitutions, will philosophically formulate as a law of political science, "The longer a constitution, the weaker the people, and the more corrupt the community."

## *A QUESTION OF CITIZENSHIP.*

THE language of the first sentence of the fourteenth amendment to the federal Constitution indicates that a person born in this country of foreign parents is a citizen. The *Staats-Zeitung* has lately called attention to the construction incidentally placed upon this part of the amendment by the United States Supreme Court in the decision in the New Orleans slaughter-house cases, and to a decision of Judge Lippincott, delivered in a case before the Hudson County Circuit Court in New Jersey.

The United States Supreme Court in its opinion in the slaughter-house cases, delivered in December, 1872, says: "The first section of the fourteenth article opens with a definition of citizenship—not only citizenship of the United States, but citizenship of the States. No such definition was previously found in the Constitution, nor had any attempt been made to define it by act of Congress." The opinion then quotes the first clause of the first section of the fourteenth article, as follows: "All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the State wherein they reside," and goes on to say:

"The first observation we have to make on this clause is, that it puts at rest both the questions which we stated to have been the subject of differences of opinion. It declares that persons may be citizens of the United States without regard to their citizenship of a particular State, and it overturns the Dred Scott decision by making all persons born within the United States and subject to its jurisdiction citizens of the United States. That its main purpose was to establish the citizenship of the negro can admit of no doubt. The phrase 'subject to its jurisdiction' was intended to exclude from its operation children of ministers, consuls, *and citizens or subjects of foreign States born within the United States.*"

In the case decided by Judge Lippincott it was held that a man born in Brooklyn, but whose father was an unnaturalized Englishman, was not a citizen of this country, and could not hold the office of councilman. Knowing that the case would be appealed to a higher court, as it has been, the judge dismissed this point as follows (we quote from a manuscript copy of the unpublished decision):

"Upon this subject, without further discussion, I adopt the views stated in the *American Law Review* for September-October, 1884, volume 18, page 831, upon this subject, and also those of Mr. Justice Gray delivering the opinion of the Supreme Court of the United States in the case of Elk vs. Wilkins, 112 U. S., page 94."

The article in the *American Law Review* was written by George D. Collins of California, and is an argument against the citizenship of the son of a Chinaman born in this country. He denies without discussion the authority of the common-law rule in such cases, and sums up his opinion as follows:

"Birth therefore does not *ipso facto* confer citizenship, and it is essentia , in order that a person be a native or natural-born citizen of the United States, that his father be at the time of the birth of such a person a citizen thereof."

In the case of Elk vs. Wilkins the opinion of the United States Circuit Court was delivered in 1884 by Justice Gray, the action being one brought by an Indian against a registrar in Omaha for refusing to register him as a voter, and is devoted almost entirely to a discussion of the political status of Indians. Of the words "subject to the jurisdiction thereof" the court says:

"The evident meaning of these last words is, not merely subject in some respect or degree to the jurisdiction of the United States, but completely subject to their political jurisdiction, and owing them direct and immediate allegiance. And the words relate to the time of birth in the one case, as they do to the time of naturalization in the other. Persons not thus subject to the jurisdiction of the United States at the time of birth cannot become so afterwards, except by being naturalized, either individually, as by proceedings under the naturalization acts, or collectively, as by the force of a treaty by which foreign territory is acquired."

The opinions above cited present what has been said judicially against the right of the son of a foreigner born in this country to be considered a citizen here. It is a complete reversal of the opinion on this question which was held by our highest authorities before the ratification of the fourteenth amendment, and the bearing of the amendment, as so construed, was not understood by some of the secretaries of state at Washington who were in office after its ratification. Justice Swayne (who, by the way, wrote a dissenting opinion in the slaughter-house cases), in writing an opinion in 1866, in United States vs. Rhodes (Circuit Court, in Kentucky), quoted from Kent's 'Commentaries,' "'Citizens,' under our constitutional laws, means free inhabitants born within the United States or naturalized under the laws of Congress," and said:

"We find no warrant for the opinion that this great principle of the common law has ever been changed in the United States. It has always obtained here with the same vigor, and subject only to the same exceptions, since as before the Revolution."

Secretary Marcy, writing instructions in 1854, said: "I have to observe that it is presumed that, according to the common law, any person born in the United States, unless he be born in one of the foreign legations therein, may be considered a citizen thereof until he formally renounces his citizenship."

Secretary Fish, in instructions written in 1873, said: "So far as concerns our own local law, a child born in the United States to a British subject is a citizen of the United States." In a letter of instructions to Mr. Cushing, in 1877, Secretary Fish said: "The minor child of a Spaniard born in the United States, and while in the United States, is a citizen of the United States." Secretary Blaine recognized the same view in a letter in 1881, in which he said: "The child born to an alien in the United States *loses his citizenship* on leaving the United States and returning to his parents' allegiance." The same idea is presented in a letter by Secretary Frelinghuysen, dated 1883, in which he says: "A child born in this country to a foreign father, when taken by his father abroad, acquires the father's domicile and nationality."

Two years later Secretary Frelinghuysen had revised his opinion on this question, and in a letter to Minister Kasson in the case of Ludwig Hausding he says: "Not being naturalized by force of the statute, Hausding could only assert citizenship on the ground of birth in the United States; but this claim would, if presented, be untenable, for by section 1922, R S , it is made a condition of citizenship by birth that the person be not subject to any foreign power." The section of the statutes quoted differs from the provision of the fourteenth amendment only in phraseology. In 1885 Secretary Bayard decided that the son of a German subject, born in Ohio, was not a citizen under the statute or the Constitution, because "he was on his birth 'subject to a foreign power,' and 'not subject to the jurisdiction of the United States.'"

But the United States Supreme Court itself does not accept the expression used in the slaughter-house cases as final on this point. In the case of Minor

vs. Happersett, decided in 1874, two years after the decision in the slaughter-house cases, it held: "Some authorities go further and include as citizens children born within the jurisdiction, without reference to the citizenship of their parents. As to this class there have been doubts. For the purposes of this case it is not necessary to solve these doubts."

In the case of Look Tin Sing, Circuit Court of California, decided in 1884, Justice Field, writing the opinion, held that a Chinaman whose parents were and always have been subjects of the Emperor of China, but who himself was born in California, was "not within any of the classes of persons excepted from citizenship [by the first section of the fourteenth amendment], and the jurisdiction of the United States over him at the time of his birth was exclusive of that of any other country." He thus defined his view of the words "subject to the jurisdiction thereof":

> "They alone are subject to the jurisdiction of the United States who are within their dominions and under the protection of their laws, and with the subsequent obligation to obey them when obedience can be rendered; and only those thus subject by their birth or naturalization are within the terms of the amendment. . . . The language used has also a more extended purpose. It was designed to except from citizenship persons who, though born or naturalized in the United States, have renounced their allegiance to our government and thus dissolved their political connections with the country."

The question may, therefore, be considered to be still awaiting a definite decision of the highest court.

## *THE IRISH OUTLOOK.*

THERE is some fear, as there have been some predictions, that the throwing out by the Lords of the Evicted Tenants bill will lead to a fierce recrudescence of agrarian agitation this winter. It is to be considered, however, that the "agitable" elements, so to speak, of Irish society have, by emigration and otherwise, been seriously reduced within the past ten years, that the statutable reductions in rents have done much to quiet thousands, and that the success of the Congested Districts Board would render it very difficult to arouse the west as formerly. The influence of the schooling of the last few years in constitutional methods, too, must not be overlooked. In short, one may fairly conclude that the last desperate weapon of disturbance and outrage is no longer available.

At the same time it cannot be denied that the position of the home-rule movement is exceedingly grave. To most thoughtful English-speaking observers outside the United Kingdom it is apparent that the Imperial Parliament, as at present constituted, cannot do its allotted work. The claims of Ireland must be in some way satisfied. The majority of Irishmen see more and more clearly that Great Britain is increasingly incapable of legislating for Ireland. National peculiarities, as between the two peoples, are becoming less marked, but the institutions of the two countries are growing more complicated and diverse. Ireland's desire for home rule is not a fire of slowly dying embers; it is one being constantly fed with fresh fuel in the shape of newly evolved wants and wishes which the Imperial Parliament has not time, knowledge, or capacity to meet. There is no better case in point than the land question. Parliament has spent session after session in the attempt to settle it, and now the parliamentary committee sitting for the past three months reveals that the work must be reconsidered.

Representatives of Irish feeling have always contended that, so long as the administration of the law is not dominated by public opinion in Ireland as it is in England and Scotland, the efforts of Parliament to satisfy Ireland must fail. This contention is supported by the evidence laid before the above committee. The working of the land laws, the interpretation of the acts of Parliament, have been in the hands of men out of sympathy with the people of Ireland, cut off from the influence of their opinion, ignorant of their aspirations and needs. Irish administrators rely for their advancement and success in life on English feeling and the spirit of the *Times* and *Scotsman*. The inquiries of this committee have brought out an almost grotesque perversion of the apparently plain wording of acts passed within the last fifteen years, and of the utterances of the statesmen who passed them, and have revealed on the part of Irish officials an almost Chinese subtlety of intellect in applying them when possible in favor of landlords and against tenants. The evidence and proceedings of this committee, published day by day in the Irish papers, have strongly impressed Irish public opinion, while in England, among those who will be the final arbitrators, scarcely any notice is taken of the proceedings, upon a proper estimation of which the welfare of the majority of Irishmen depends. Many a cricket match in London, many a race between the *Vigilant* and *Britannia*, has attracted more attention than all the doings of the committee from first to last.

The Liberals who espoused the cause of home rule have proved true, but in what direction behind them is British opinion tending? Is further proof to be afforded that when Ireland is quiet her demands are not deemed worthy of attention; or is English opinion, after its deliberate but weighty fashion, resolving that the home-rule measure formulated and passed through the House of Commons must, spite of the opposition of the Lords, become law? It is difficult to say. Perhaps no other Parliament has been so productive of great measures for the people of Great Britain. They have gained much, and they would have gained nothing without the steady support of the Irish vote. The Government came into power to settle an Irish grievance, yet so far nothing has been carried for Ireland. Will Great Britain at the next election, in full appreciation of the services rendered by Ireland and of the necessity for a settlement, rally to the Irish cause? Or will she, having secured so much for herself, forget those to whom she is so largely indebted, and fall back into one of those lethargies regarding reform which have in England so often followed periods of radical activity?

The public supineness as to the rejection of the home-rule measure by the Lords, contrasted with the general indignation when the Employers' Liability bill was mutilated, is ominous. It would be different if Irish were linked with English reform; if Englishmen felt for the inhabitants of Meath and Mayo as they feel for those of Lancashire and Suffolk; if, in short, public opinion and public sentiment extended across the Irish Sea. But this is not the case. So long as the Lords have the astuteness to pass with little material change measures important to Great Britain, it is to be feared they will be allowed to mutilate or reject bills relating to Ireland. Moreover, much that has occurred of late years at home and abroad has tended to discourage former hopes as to radical changes. Italy has been a disappointment; so has the slow progress of orderly liberty in South America. Add the rise and spread of Anarchy, the prevalence of impossible labor demands and of labor riots. In Ireland this perpetual unsettlement is most disastrous. It retards or prevents minor reforms; it too often, in local affairs, aids unworthy persons and interests in keeping their hold upon the public conscience and the public purse by simple verbal adhesion to popular principles.

The events of the past few months force certain considerations especially upon the attention. One is the failure of the Liberal Unionists to justify their existence as a party determinedly set against home rule, but strenuous for radical reforms in the government and administration of Ireland. There is nothing now to distinguish them in this respect from the bluest of blue Tories, the most orange of Orangemen. Mr. Courtney and Mr. Russell are perhaps exceptions—the one in genuine sympathy with Irishmen in their material concerns, the other a friend of Ulster tenants. On the other hand, it was hoped that Mr. Gladstone's retirement would make little change regarding the progress of the Irish question in Parliament. Concerning that and all others, it has made an immense alteration. The great debates continue,

but in a different, a more material atmosphere.

### *MR. GLADSTONE ON THE BLESSINGS OF HERESY.*

THE incurable optimism which is one of the essential qualities going to make Mr. Gladstone an ideal democratic leader, was never given more striking display than in his *Nineteenth Century* article on "Heresy and Schism." Subject and treatment doubtless illustrate other characteristics of his. If he cannot say with Emerson that he loves a cowl, at least he can that he likes a shovel-hat; and theological speculation and ecclesiastical controversy have had a singular fascination for him ever since his 'Church and State' of fifty-five years ago. A certain mental flavor and method not unlike those of a scholastic theologian likewise appear here and there in the article. Bagehot long ago singled out this quality in him. But what impresses one above all else in this latest writing of Mr. Gladstone's is, the obstinate hopefulness with which he observingly distils out the soul of goodness in things evil.

He himself is a High Churchman of the straitest sect. To him, as he intimates in the article itself, the Church is a divine organism, with a "jurisdiction solemnly constituted" and vested in the successors of the Apostles. Accordingly all who "rebel" against that jurisdiction do thereby "frustrate, so far as in them lies," the work of the Divine Founder of the Church. With these convictions, how would it be supposed that an old man, gazing abroad upon a disrupted Christendom, would consider the case of those men and sects that have rent in pieces the seamless garment of the Lord? We should expect such gloomy views and lamentations as we are, in fact, accustomed to receive from High Church quarters. The principle of authority is broken down. Men will no longer "hear the Church." They turn their backs on the true light, and are following wandering stars, which will infallibly lead them into the blackness of darkness. This is what any man in Mr. Gladstone's position, without his unquenchable optimism, would have told us. But he serenely turns to the great compensations, nay, the positive blessings, which the stoutest High Churchman may see in the spread and power of heresy.

Without following him through the steps by which he thinks it necessary to justify himself in so much as taking this point of view, it is enough to say that the main benefit he finds in modern schism is its testimony to the power of what he calls "undenominational religion." What he means he sets forth in the following impressive and pathetic passage:

"I do not know on earth a more blessed subject of contemplation than that which I should describe as follows: There are, it may be, upon earth 450,000,000 professing Christians. There is no longer one fold under one visible shepherd: and the majority of Christians (such I take it now to be, though the minority is a large one), is content with its one shepherd in heaven, and with the other provisions He has made on earth. His flock is broken up into scores, it may be hundreds, of sections. These sections are not at peace, but at war. . . . But with all this segregation, and not only division but conflict of minds and interests, the answer given by the four hundred and fifty millions, or by those who were best entitled to speak for them, to the question what is the Gospel, is still the same. With exceptions so slight that we may justly set them out of the reckoning, the reply is still the same as it was in the apostolic age—the central truth of the Gospel lies in the Trinity and the Incarnation, in the God that made us, and the Saviour that redeemed us. When I consider what human nature and human history have been, and how feeble is the spirit in its warfare with the flesh, I bow my head in amazement before this mighty moral miracle, this marvellous concurrence evolved from the very heart of discord."

Such optimism in such a man seems to us almost unexampled. It is an optimism, however, which does not take close enough observation of the facts upon which it works. Narrowly scrutinized, the "marvellous concurrence" which Mr. Gladstone esteems so encouraging, would not prove of a sort to delight one who holds the doctrines he mentions in any such sense as he does. The concurrence is too much that of a relaxed grasp on all dogma, of a rationalizing translation of the historic teaching of the Church into terms of modern thought, of the refining and transcendentalizing tendency which will accept any creed or all creeds provided the right of private interpretation is reserved. No one thoroughly conversant with the way in which the two doctrines which Mr. Gladstone mentions are actually held among the leading Protestant sects would dare to say that they mean the same thing now as in the apostolic age or in the Nicene Creed. Even as these dogmas are held at the present day, they are accepted for an entirely different reason. Once it was sufficient that Mother Church taught them. Now the standpoint is rather that of Coleridge—that they "find" men, that is, inspire and comfort men. But this of itself is so wide a departure from the divinely commissioned Church with its solemn jurisdiction that any concurrence to be made out besides seems necessarily barren.

Naturally the blessings of heresy would be very differently described from a more secular standpoint. Probably Janet puts the case in a way acceptable to the modern spirit when he says that "without criticism and investigation the world would be one universal China." Heresy able to maintain itself for a century or two insures free inquiry. That has come to be the principal thing with modern man, whether it leads him to heresy or orthodoxy. Milton declared all belief, true or false, to be heresy, provided a man held it without sufficient reason. "A man may be a heretic in the truth," he says in the 'Areopagitica'; "and if he believe things only because his pastor says so, or the assembly so determines, without knowing other reason, though his belief be true, yet the very truth he holds becomes his heresy." It is from heresy of that kind that the modern world devoutly prays to be delivered.

### THE BRYANT CENTENNIAL.

PITTSFIELD, MASS., August 17, 1894.

AT Cummington, yesterday, was observed in appropriate fashion the centennial of William Cullen Bryant's birth. From time to time during the past twenty years we have celebrated the centennial of events important in our national history, from the Boston Tea Party to Washington's inauguration; whereas the exercises at Cummington commemorated our earliest American poet, and, in so doing, they celebrated the birth of American poetry. Bryant's priority is indisputable, for he was born November 3, 1794, and wrote "Thanatopsis" in October, 1811. Of the poets who belonged to his generation, and who constitute what is already coming to be regarded as the classic group, Emerson was born in 1803, Longfellow and Whittier in 1807, Holmes and Poe in 1809, and Lowell and Whitman in 1819. Older than Bryant were three single-poem men, Hopkinson, Key, and Payne; but "Hail, Columbia," "The Star-Spangled Banner," and "Home, Sweet Home" were all written after "Thanatopsis." At any rate, these three popular pieces would never pass for great poems. So, too, Fitz-Greene Halleck, born in 1790, and for many years hailed, particularly in New York, as a genius, has long since been properly classified. He does not, like Bryant and the other members of the group I have mentioned, represent any important idea or reveal to a remarkable degree any quality of permanent value in literature—as Holmes does wit—and so we can no more rank Halleck among the great American poets of the century than we can rank Praed or Bayly among the great English poets.

Bryant's priority in time is therefore as unquestionable as is the excellence of "Thanatopsis," his first poem—a work which, whether it be judged as the production of a youth of seventeen, or by the strictest canons of criticism, stands forth among the splendors of the language. His peculiar vein, a minute and loving description of nature—"fixed," as painters would say, by a spray of moralizing—he exhibited from the start. After "Thanatopsis," "The Waterfowl," "The Yellow Violet," the "Inscription for a Wood," and the few other poems like them published in 1821 in his first volume, Bryant wrote nothing characteristic which cannot be traced to a similar inspiration. He found his vocation in boyhood, and never went in search of novelty. The result was that the impression he produced was deep and uniform, and, we may believe, permanent. Nature became through his interpretation moral, as through Emerson's she became spiritual, and through Shelley's emotional. A moralized nature cannot cease to interest and uplift mankind.

Reflections such as these were doubtless in the minds of hundreds of persons who made yesterday the pilgrimage to Cummington. That village lies in northwestern Massachusetts, among the hills of Hampshire County.

The landscape is sterner and less picturesque than that of Berkshire. There are no broad valleys, suggestive of fertile farms and prosperity, but narrow hollows between hill and hill through which brawls some tributary of the Westfield River, which murmurs here and there as it is forced to turn a paper or a saw-mill. Along the less frequented ways you may drive several miles without passing a house; and even on the highroad the dwellings are often two or three furlongs apart. It is a region to delight the tourist who loves long stretches of woodland roads, where the shadows lie thick, varied by a panorama of whale-back hills, some yellow with grain and hay, others green with forests. Far away to the northeast you catch now and then a glimpse of Monadnock, a mere bubble of purple haze; towards sunset, Greylock juts like a blue promontory into the billows of green. Life on these Hampshire uplands must resemble life on a roof; all the sunshine of summer, without its heat, pours upon them, but bleak indeed must their winters be!

On one of the highest of the hills, midway between the villages of East and West Cummington, is the Bryant homestead. There is nothing about the house or the place to recall the days of the early settlers, among whom were Bryant's father and mother's father. The house was wholly remodelled and enlarged thirty years ago, when the poet bought it back, to be a summer retreat for his old age. The place, with its trim hedges and lawns, its well-kept walls and fences, and its fields freed from stones, reveals at once that it belongs to no farmer, but to an owner with leisure and taste and means, which Hampshire farmers lack. Immediately behind the house is a grove of large pines—a rare tree in this region now—which join a wood of beeches, birches, maples, and hickory that stretch to the top of the hill. From the front piazza, you look just across the road to a field, through which runs the rivulet, and which is bounded by the larger wood, the theme of one of Bryant's best poems. Then the gaze ranges east and north for thirty or forty miles, ricocheting from hill to hill, to be lost at last in the hazy horizon. The site of the cottage where Bryant was born, long since destroyed, the old graveyard, the meeting-house, and the tavern, must all be sought at East Cummington, two miles away; to the present homestead his father brought him when a little child, so that this is the environment amid which his boyhood and youth were chiefly spent. Down at Plainfield, in the hollow yonder, he studied with the Rev. Moses Hallock, in preparation for Williams College; southward, out of sight, lies Worthington, where he first read law. Changes among these hill villages are rare, and they are chiefly changes of decay, there being in Cummington only eight hundred inhabitants now, against nearly double that number in Bryant's youth. Much of the soil then rich for farming has run out and become pasture-land; many are the cellars, choked with weeds and brambles, where dwellings then stood.

Could good Dr. Bryant, the poet's father, who for thirty years was the doctor of this countryside, have beheld the cavalcades which from early morning yesterday converged by all available roads to his house, great would have been his astonishment. Nearly a thousand vehicles, from the two-wheeled gig to the four-horse tallyho, came laden with visitors from all points within twenty miles. Those who brought no driver unhitched their horses, tied them to the nearest fence or tree, and then strolled towards the grove behind the house. There, under the shadow of the beeches and maples, a platform, capable of holding a couple of hundred persons, had been erected, and in front of it, on a gently rising slope, seats for twice as many more had been prepared by nailing boards to stakes driven into the ground. A portrait of Bryant, wreathed with ferns, was hung on a tree in full view of those who faced this platform, and a bank of flowers and greens partly hid the melodeon which was to accompany the singing.

By ten o'clock the platform began to fill with members of Bryant's family and with invited guests, and in a few minutes all the seats there and on the slope had been taken, and a circle, constantly increasing, of late comers who had to stand was drawn about them. One may have seen many gatherings in many lands, and yet have seen no gathering like that. In the first place, it embraced all ages, from the oldest inhabitants of Cummington and the neighboring villages, to the babes who came with their mothers—good farmers' wives, who, having no one to leave the little ones with, brought them and the other children. In the next place, it embraced all classes, whether you made wealth or occupation or intelligence the test of classification. Nor could the genuineness of the interest taken fail to strike an observer. A few of the visitors may have come out of curiosity, but nine-tenths came because they wished to do honor to Bryant and through him to poetry. The people of the neighborhood naturally far outnumbered the strangers, and afforded a good opportunity for studying the physique and manners of a community where the native stock has never mixed; so pure is it in Cummington that out of two hundred voters only three—an Irishman, a Nova Scotian, and a Canadian—are foreign-born. I fancy that the farmers of this generation do not fall below the average of their fathers in thrift and common sense; certainly the specimens one saw in Bryant's grove could not easily be matched in any gathering of remote country-folk in England or on the Continent. Yet now, as hitherto, the bright and energetic hill-born lads speed away as soon as they can, like their homeside brooks, down into the plain and to the cities of the plain.

I need not describe the exercises in detail. They were well arranged to give the villagers, the personal friends of Bryant, and the larger circle of his admirers, severally, due recognition. In its way, nothing was more satisfactory than the unpretentious, downright welcome extended by Mr. Lorenzo H. Tower in behalf of the people of Cummington. You heard there the genuine rural Yankee, who thinks better than he talks, but who does not, on that account, fail to reveal his sincerity. No polish of phrase could have expressed more clearly the cordiality of himself and his neighbors. They spread out their best—there could be no doubt of that. So, too, did the village chorus and orchestra.

But the most interesting figure on the platform was the poet's only surviving brother, Mr. John H. Bryant, now eighty-seven years old, erect in body and awake in intellect. He recited two original poems in a firm, far-carrying, not unmusical voice. The presence of Mr. Parke Godwin, Bryant's son-in-law and biographer, and of the Hon. John Bigelow, who, like Mr. Godwin, had been associated with Bryant in editing the New York *Evening Post*, helped to deepen the feeling that we were contemporary with the poet himself—a feeling which could come only in the case of a man who, like Bryant, lived more than four-score years. Next year Keats's centennial will be celebrated; but he died at twenty-five, and probably not one of his acquaintances now survives. The feeling that Bryant had been gone but a little while was characteristic of yesterday's celebration, and gave the exercises a personal and reminiscent rather than a critical or literary cast. The principal speakers, Mr. Godwin, Mr. Bigelow, Mr. E. R. Brown, Mr. Charles Dudley Warner, and Prof. C. E. Norton, all displayed a truly Bryantesque moderation, which would have pleased no one more than the temperate Bryant himself. They refrained from eulogistic brag, they made no claims as to Bryant's position in our literature, nor belittled others in order to magnify him. It seemed to be taken for granted, both by speakers and hearers, that in Bryant we had a personality of uncontested worth, and that it was no more profitable to argue about the excellence of his poems than about the upland air, the sunshine, and the rolling landscape, by which we were actually surrounded; if these were good, then the poetry which reproduces them must be good. To appreciate, rather than to criticise, was the prevailing spirit, and it did not degenerate into vapid admiration.

Several speakers laid stress on Bryant's unswerving uprightness as a politician and on his dignity and honor as a journalist. Listening to this reiterated praise, one was in doubt whether to rejoice that Bryant deserved it, or to blush because those qualities are so rare as to require mention. What would a Utopian have inferred of the standards of our politics and newspapers if he knew no more of them than that Bryant gained great renown by seeking no spoils, though he was a politician, and by telling no lies nor scandals, though he was an editor? Possibly at the next Bryant celebration, more emphasis will be given to him as a model journalist than as a poet, since the ideals of editorship which he upheld seem in danger of extinction.

But yesterday, contemplating his career as one after another of his friends told of it, vehement thoughts were banished. Even the presence of Mr. John W. Hutchinson, the last of the famous family of anti slavery singers, while it recalled Bryant's strenuous labors for emancipation and for the Union, was impressive, but not stirring. The exercises—interrupted by an interval in which the guests were entertained at tables spread under the apple-trees, and the others took their luncheon in the fields or woods—had not lost the quality of peace and friendliness when the time came, late in the afternoon, when the last tribute had been paid, the last hymn sung, and the concourse, numbering three thousand or more persons, broke up. Bryant, fortunate in his genius and his influence, was fortunate also in his birthplace, for those who would do him honor must quit the cities, and seek the Hampshire hills, where, restored and delighted by Nature herself, they will be in high mood for enjoying his poetry. On the grove-crowned hill of Cummington, as on an outpost of Parnassus, his spirit, like a Muse, will long abide, to cheer, and stimulate, and purify men.

Wm. R. Thayer.

## WALTER PATER.

Oxford, August 1, 1894.

The late Walter Pater's nature, like that of his hero Marius, was "composed in about equal parts of instincts almost physical and of slowly accumulated intellectual judgments"; and, like that of Marius, his character "was perhaps even less susceptible than other men's

characters of essential change." More than most men he believed "that to be but sentient is to possess rights"; and, again like his hero, he would see "the very symbol of our poor humanity" in the maimed race-horse led away by strangers "to die, in his beauty and pride, for just that one mischance or fault, although the morning air was still so animating and pleasant to snuff." "I could have fancied," cries Marius, and his author with him, "a human soul in the creature, swelling against its luck."

As a writer Mr. Pater is best understood when his own distinction between "mind" and "soul" is heeded. He had "a way of absorbing language, of attracting it into the spirit he was of, which makes the actual result seem like some inexplicable inspiration." Certain antagonisms provoked by him find their best explanation in his own dictum: "Mind we cannot choose but approve where we recognize it; Soul may repel us, not because we misunderstand it." This quality of "soul" in his style lends to his writings a kind of religious influence, and the matter which he treats is allied to the peculiar form into which he fashions it by an "electric affinity" flowing from him into both, so that their union works upon his reader by "an immediate sympathetic contact." The magical potency of language, for one possessing his gift of style and using it conscientiously, will make him deal with every-day words as with the consecrated rubrics of a hallowed ritual. Indeed, some such thought underlies the comparison made by Mr. Pater between admission into the communion of the Catholic church, and "the coming into possession of a very widely spoken language." It was with no light sense of the responsibility incurred in his choice that he aimed in his writing at a transcript not of mere fact, but of fact as modified by his own preference, of his own peculiar sense of fact. He lived in a state of scrupulous scholarhood, and found a craftsman's opportunity in the constant recognition of limitations inherent in the structure and vocabulary of the language in which he worked.

How he came to be himself is, of course, only to be understood in connection with the facts of his life and the general atmosphere by which he was surrounded; but no detailed biography, no history of intellectual life in his times, will ever communicate the insight into his nature which can be gained by a sympathetic perusal of the shortest of his fifty-odd essays; and the reader of 'Marius the Epicurean' or of 'Plato and Platonism,' his two longer works, can know Mr. Pater as a familiar friend without mastering a date or a detail in his biography. We might, in fact, apply to him (if only the inevitable word expressing his quality would come, as it came to him, for Cicero's) his own saying that "the sumptuous good taste of Cicero," encountered in everything he wrote, is "as truly the man himself as would have been his portrait by Rafaelle, in full consular splendor on his ivory chair." Not that a special interest fails to attach us to our writer's life, briefly though its outline may be given. He was born fifty-five years ago, in 1839, not far from the busy streets of London, in "the old house" that stood, as he describes it, just aloof from the town. Both of his parents died while he was still young, and the tidings of his father's death, "the cry on the stair sounding bitterly through the house," struck into his soul for ever. There was in the family an element of French descent derived from Watteau's favorite pupil, whose name was Pater, and who is described in one of Mr. Pater's Imaginary Portraits under the name of Jean-Baptiste. Everything in "the old house" had "a noticeable trimness and comely whiteness—the curtains, the couches, the paint on the walls with which the light and shadow played so delicately"; and in the garden grew a great poplar such as French people love, "having observed a certain fresh way its leaves have of dealing with the wind, making it sound, in never so slight a stirring of the air, like running water." The father was a medical man by profession, and both parents were of the Roman Catholic church. This circumstance perhaps gave Mr. Pater that rare and reverent understanding of what is most beautiful and consoling in the Roman ritual, otherwise hardly attainable by one not brought up as a son of that church.

At the age of twelve or thereabouts, and "in an agony of homesickness," young Walter Pater was taken from "the old house" to a new home. In due course he went to the King's School at Canterbury, and was entered at Queen's College, Oxford. At twenty-two he was placed by the examiners *in Literis Humanioribus* in the second class, where Matthew Arnold, his predecessor as the first of English critics, had been placed just eighteen years before, and where Lewis Nettleship (like Pater, a memorable exponent of the Platonic philosophy) was placed seven years afterwards. In 1865, Mr. Pater was elected Fellow of Brasenose, and he never severed his connection with that college, always as lecturer and more recently as Dean. For many years he lived in London, coming each term to occupy his rooms at Brasenose. What well-ordered rooms they were, severely beautiful, the whole effect being duly proportioned to one work of early Italian sculpture in low relief, which looked out among simple furnishings of a pale but serviceable blue. To these college rooms he was attached, and may therefore have found it easier to give up his house in London as he finally did, forced by considerations of health to exchange it for the one in Oxford, where his life has just closed.

The earliest of our author's published essays, that on Coleridge, dates back to 1865, the year of his election as Fellow, but was revised and expanded in 1880. In 1867 came the essay on Winckelmann, and that on Æsthetic Poetry was written in 1868, the year during which he wrote the memorable "Conclusion" which appeared at the end of his studies of the Renaissance in 1873. 'The Renaissance: Studies in Art and Poetry,' was his first published book—a collection of essays previously printed for the most part. Two other collections of his essays were published by him. 'Appreciations, with an Essay on Style' (1889), contained articles written both before and after those in his 'Renaissance,' which were consecutively written between 1868 and 1873. Four 'Imaginary Portraits' were collected in 1887, but this volume does not include 'The Child in the House,' which is an autobiographical picture of the author's own idealized childhood, accessible in *Macmillan's Magazine* for 1878. To back numbers of sundry magazines we are forced to look for various important essays, including the Taylorian lecture of 1890 on Prosper Mérimée, and those wonderful studies of Greek religion, art, and life which Mr. Pater hoped to publish "some day." One of these, on the "Bacchanals" of Euripides, has been reprinted in Dr. Tyrrell's recent edition of that play. "The article is itself a poem," says Prof. Tyrrell, who welcomes it as wholly worthy of the work with which it deals. It may confidently be expected that these Greek essays will shortly be collected in book form, and it is certain that they will do a wonderful service for what Mr. Pater has called "the study of the ancient Greeks as a living people."

'Marius the Epicurean,' written between 1881 and 1884, and 'Plato and Platonism,' written in 1891–1892, still remain to be considered. Mr. Pater's departure from the form of his earlier choice, his resolve to use a larger canvas than that of the essayist, may have been due to a sense of certain limitations. "The modern essayist," we read in 'Marius,' "is a creature of efforts rather than of achievements in the matter of apprehending truth, but at least conscious of lights by the way, which he is bound to record, acknowledge." In the "conclusion" of his 'Renaissance' such lights by the way flash out in the dictum, "Not the fruits of experience but experience itself is the end"; in the warning, "A counted number of pulses only is given to us of a variegated, dramatic life"; in the question, "How shall we pass most swiftly from point to point, and be present always at the focus where the greatest number of vital forces unite in their purest energy?"—in the conclusion that "to burn always with this hard, gem-like flame, to maintain this ecstasy, is success in life." Experience having shown that some readers were dazzled rather than enlightened by these brilliant flashes of insight, Mr. Pater apparently became convinced that the truth as he saw it could never be faithfully expressed until he portrayed a successful career, embodying just the type of living and thinking in which he believed. 'Marius the Epicurean, his Sensations and Ideas,' is the well-considered title of the book of the life whose end is not the fruit of experience, but experience itself. This same life is brought, in our author's 'Plato and Platonism,' into the presence of the master thinker by whose writings Mr. Pater was chiefly sustained, stimulated, and inspired. How real the philosophic unity is which runs through all our author's work, at least in his own conception of it, is best shown by the circumstance that he suppressed in 1877 the "Conclusion," written in 1868, of his studies of the Renaissance, first published in 1873, until "the thoughts suggested by it" had been more fully dealt with in his 'Marius,' which was finished in 1884. This temporary withdrawal was in no sense a recantation; it was made under an impression that the "Conclusion" might possibly mislead some of those young men into whose hands it might fall, and the "Conclusion" was restored in the third edition of our author's first book, issued in 1888.

Some attempt to adumbrate the consistent view of "the way and the life" adhered to by Mr. Pater, in practice as well as in his writings, must be made before this record of him can be regarded as in any sense complete. The only suitable introduction is 'The Child in the House,' already characterized. As the child, Florian sat quietly, feeling "a kind of exquisite satisfaction in the trimness and well-considered grace of certain things and persons"; his quickness of memory and readiness of mind astonished his mother, from whom he was learning to read "at the window with the bird-cage hanging below it." "The perfume of the little flowers of the lime-trees fell through the air upon them, like rain; while time seemed to move ever more slowly to the murmur of the bees in it, till it almost stood still on June afternoons." The enormous shaping power of the "sensible things which are tossed and fall and lie about us, so or so, in the environment of early childhood," became for Florian "a

sanctuary of sentiment, a system of visible symbolism interwoven through all his thoughts and passions, so that little shapes, voices, accidents—the angle at which the sun in the morning fell on the pillow"—became "parts of the great chain" wherewith he was bound.

The recognition of this power in sensible things to mould the human soul constitutes Mr. Pater's conception of the essence of Platonism. "There have been," he says in his chapter on Plato's æsthetics, where, as elsewhere in the book, he has blended into a rich and deep-toned harmony all the melodies of joy and notes of sadness of all the experiences of beauty in life, in literature and in art with which his many-sided experience has enriched him—"there have been Platonists without Plato, and a kind of traditional Platonism in the world, independent of, and yet true in spirit to, the Platonism of the Platonic dialogues." Experience, however, taught him that only a limited number of sensitive people were constantly susceptible "to the aspects and other sensible qualities of things," and that it is only with a reservation that we can say "men's souls are the creatures of what men see and hear." Plato's error—if error there be—lay in supposing that this constant susceptibility belonged to men generally. Nevertheless, Mr. Pater's last philosophical word upon the influence of beauty is probably conveyed in his elucidation of the Platonic sense of *form* and its educational power. "Concision, simplicity, rhythm, or contrariwise, abundance, variety, discord," are subjected to a transformation in the temper of the patient, the hearer, or spectator, "a derivation into another kind of matter"; that is to say, "into terms of ethics, into the sphere of the desires and the will, of the moral taste, engendering, nursing there strictly moral effects, or quite the opposite, but hardly in any case indifferent conditions."

That this was no mere putting of thoughts that were Plato's, but rather a recognition in Plato's system of truths which had grown into the experience of the writer, may abundantly appear if you read the closing pages of Mr. Pater's "appreciation" of Wordsworth, written twenty years before, in 1874. Wordsworth, and poets ancient or modern who have shared his highest mood, are there portrayed as experts in the art of "impassioned contemplation." As such, they teach no lesson, enforce no rule, but only withdraw men's thoughts "for a little while" from the mere machinery of life "to fix them, with appropriate emotions, on the spectacle of those great facts in man's existence which no machinery affects," on the "great and universal passions of men, and the entire world of nature. To witness this spectacle with appropriate emotions is the aim of all culture; and of these emotions poetry like Wordsworth's is a great nourisher and stimulant." But there is, our writer dreamed or divined with his own Marius—there is for the man who can witness all this with the right emotions, whose consciousness has been enlarged, has grown rich and shapely under the transmuting and most musical spells of friendship and familiar brotherhood—there is for such an one the sense of "some unfailing companion," "doubling our pleasure in the roses by the way." "Dared one hope," cried Marius in sad communion with the woes of human life, "that there is a heart, even as ours, in that divine 'Assistant' of one's thoughts—a heart even as mine, behind this vain show of things?" In this reasonable though impassioned cry of Marius, we find again the religion of "the child in the house," conceived of by Florian as "a sacred history indeed, but still more a sacred ideal, a transcendent version or representation, under intenser and more expressive light and shade of human life and its familiar or exceptional incidents, birth, death, marriage, youth, age, tears, joy, rest, sleep, waking." LOUIS DYER.

## CHUQUET'S ROUSSEAU.

PARIS, August 2, 1894.

MM. HACHETTE continue the publication of their essays on the "Great French Writers." There is no visible plan in the publication—no chronological plan, at least. The collection places Victor Cousin and George Sand next to Montesquieu and Mme. de Sévigné, M. Thiers near Turgot, Théophile Gautier near D'Alembert, Mme. de Staël near Vauvenargues, Bernardin de St. Pierre near Mme. de la Fayette. The other names are Mirabeau and Rutebeuf, whom few people would have thought of placing among the "Great French Writers" (especially Rutebeuf, who is known only to bibliophiles), Stendhal (Henri Beyle), Alfred de Vigny, Boileau, Chateaubriand, Fénelon, Saint-Simon, Rabelais, J. J. Rousseau, Diderot.

The task of judging Rousseau was put in the hands of M. Arthur Chuquet, a professor in the French University. It was no easy task. There is at the present time a great reaction against Rousseau; he has been severely treated by Taine; he is considered one of the inspirers, the chief inspirer, of the men who gave to the French Revolution its worst character. He was not only the idol of the dissolute society of the end of the eighteenth century, he was also the idol of Robespierre, of St.-Just and the Montagnards. The 'Contrat Social,' the 'Émile,' had an immense influence on the development of our legislation, of our modern culture, of our philosophical views.

All these essays published under the general title of "Les Grands Écrivains Français" have one thing, at least, in common—they all are cut on the same pattern; they have a purely biographical part, followed by an analysis of the works of the author, and this analysis is generally resolved into several parts. The same object is shown to us from several points of view. It is impossible not to see the influence of Taine's analytical method in this uniform system. M. Chuquet, in his 'Rousseau,' gives us in succession the life, the letter to D'Alembert against the theatre, the 'Nouvelle Héloïse,' 'Émile,' the 'Contrat Social,' religion, the 'Confessions,' style, influence. I should myself, I confess, prefer a synthetical method. The works of an author are so interwoven with his life, and his life so interwoven with his works, that it seems difficult to separate them. Rousseau especially can hardly be understood if you separate his writings from his actions.

He was born in Geneva June 28, 1712, and spent the earliest years of his life in the most beautiful country in Europe. No wonder that he became afterwards a sort of apostle of "nature" in the artificial society of Paris. It is clear, also, that Geneva had much to do with his republican ideas; up to the time that his persecution began he liked to call himself a "citizen of Geneva." His mother, Suzanne Bernard, handsome, coquettish, a good reader of novels, died when he was born; his father, Isaac, watchmaker and dancing-master at the same time, was a man of pleasure, frivolous, egotistical, a sort of adventurer, quarrelsome. He tried to make a fortune in Constantinople. Such a man was incapable of educating his children. His eldest son, François, disappeared one day and was never seen again. The younger son, Jean Jacques, did not live long with his father. He stayed at various places, at Bossey, at Nyon, till, at the age of sixteen, he was persuaded by a Savoyard curate to turn Catholic, and was sent by him to Mme. de Warens, who lived at Annecy, and who received new converts and was a sort of Catholic missionary—a singular missionary, surely.

Françoise Louise de la Tour, born a Protestant at Vevey in 1699, had been married in 1713 to M. Sébastian de Loys de Warens; she had tried to make a fortune by establishing a silk-manufacture, had fallen into debt, and had fled to the other side of Lake Leman, where she met King Victor Amadeus at Évian; she turned Catholic with great demonstrations and obtained a pension from the King. She was thirty-one years old when she received young Jean Jacques on March 21, 1730. We had not much to learn about her from M. Chuquet: Rousseau has given a minute description of her in his 'Confessions.' Her influence over him was omnipotent; he was almost a child, and she, though she professed to be religious, was utterly devoid of principle. She looked upon chastity as a vulgar prejudice. She often said that a woman needed only to save appearances, and she found it perfectly natural to have any number of lovers. "She surrendered herself," says M. Chuquet, "quietly, without any scruples or remorse. Why should she have refused to her friends a favor which in her eyes had no importance, and which increased their affection?" The history of her later years has recently been told with many unpublished details. I will content myself with saying that she died in want and generally despised on July 29, 1762.

Rousseau has told us how Mme. de Warens sent him to Turin to the school of Catechumens, how he crossed the Alps, as proud as Hannibal, how at the school of the Spirito Santo he was converted in four months. This school was a real prison. He tells us that in fact he sold his religion and told a lie to the Holy Ghost. He was put out of the school with twenty francs in his pocket, and became a servant—so bad a servant that he was dismissed; and he returned to Annecy. Mme. de Warens kept him; she became his "maman." After awhile, he entered the seminary at Annecy; at the end of two months he was again dismissed. The story of all his adventures would be too long. From his numerous wanderings he always returned to Mme. de Warens; her house was his refuge; "maman," if we may believe Rousseau, for fear lest he should not be virtuous, offered herself to him as a holocaust. "With a grave air and in a moral tone, not severe, but more serious than usual and almost solemn," she said to Jean Jacques that she preferred to sacrifice herself, and she gave him a week to reflect upon it. At the same time Rousseau was aware that she had already a lover, her servant, Claude Anet, who was, like herself, a Vaudois, and had been converted at the same time. Rousseau accepted this singular situation, and thus began what the French call a *ménage à trois*. The genesis of Rousseau's ideas and of his talent must be found in the long years which he spent in the country, as well as in the hatred which he conceived, in his numerous attempts at bettering his position, for all the regular organs of a civilized community.

He found what may almost be called his "chemin de Damas" in a visit which he paid, in 1749, to Diderot, who was then shut up at

Vincennes. He read on the way a number of the *Mercure de France*, and saw that the Academy of Dijon had offered a prize on this subject: "Has the reëstablishment of science and the arts helped to corrupt or to purify mankind?" The idea struck him; he was seized with a sort of mental delirium. "No, no," he said to himself, "science and art have not made men better; our social system is full of contradictions; the natural man is good; our institutions and their abuses have made him bad." He cried, he saw Diderot, and laid his ideas before him. Diderot advised him to compete for the prize. The "Discours sur les lettres et les arts" had an immense success; the Academy of Dijon bestowed its prize upon it. Rousseau became famous in a day; everybody admired his warm, exuberant, and eloquent style. His ideas on nature and the natural man became a theme of discussion in the most artificial society that ever existed. Extremes meet, and the return to nature inaugurated by Rousseau seemed the most wonderful discovery. The most aristocratic ladies were enraptured by the "Origine de l'inégalité parmi les hommes," his second essay, in the same vein as the first. "Unhappy men who are always complaining of nature, learn that your misfortunes are your own work." Rousseau dedicated this new "Discours," written in 1755, to the Republic of Geneva.

Madame d'Épinay conducted Rousseau, whom she called "my bear," to a cottage in the forest of Montmorency. He had a singular habit of quarrelling with all the people who were kind to him. He was, besides, encumbered with his dreadful Thérèse, whom he had made his wife, though she was without beauty or education, and with her family. He had also a sort of habit of falling in love, and he nourished soon a great passion for Madame d'Houdetot, a cousin of Madame d'Épinay. Madame d'Houdetot did not return his passion, as she was involved with Saint-Lambert in one of those "liaisons décentes" which became so general in society during the eighteenth century. Rousseau was at the same time very timid and very combustible; and, if I may be allowed to use a very vulgar expression, he made a perfect fool of himself in his relations with Madame d'Épinay and with Madame d'Houdetot. He had the mortification of being treated with contempt by Saint-Lambert. He had become a sort of social parasite—not of the most aristocratic society, which in reality never accepted him, but of the rich society of the *fermiers-généraux* and of the *noblesse de robe*, which was not the society of the court.

His humble position filled him with anger and rage. He quarrelled with everybody. He consoled himself with the extraordinary success of his 'Nouvelle Héloïse,' a book which we find now almost unreadable, but which agitated the eighteenth century, by the ardor of its passion, by its love of the beauties of nature, by a sensibility which was unknown before. In fact, sensibility became the fashion; the dogma of the legitimacy of passion, the most dangerous that can be preached, was easily accepted by a frivolous public. The 'Nouvelle Héloïse' was the precursor of 'Werther.'

In a short period, and while he was still at Montmorency, Rousseau published the 'Héloïse,' the 'Contrat Social,' and the 'Émile.' These three books are his great works, and contain all his doctrine. The 'Émile' was the signal for the final rupture between Rousseau and the philosophers. Voltaire did not believe in the *natural* man, nor in the primitive equality of men, nor in the dangers of civilization, nor in the evil effects of laws and of education. In his eyes, 'Émile' was no better than a beast; he believed in the virtue of art, of science, of literature; he believed in kings and constitutions.

At the close of his life, Rousseau, embittered by his constant quarrels with his enemies and his friends whom he fatally turned into enemies, and by the sarcasms of the philosophical school, became almost if not wholly mad. He had what the modern school of physiology calls the mania of persecution; he saw enemies and conspiracies everywhere. This neurosis is the great excuse for his follies and his meanness. His literary influence was as extraordinary as his political influence afterwards became; he was not only the inspirer of the revolutionists who proclaimed the rights of man, he was also the inspirer of the literary movement which found expression in Chateaubriand and, after him, in the great Romantic school.

# Correspondence.

## SILVER VIEWS OF THE CALIFORNIA REPUBLICANS.

To the Editor of The Nation:

Sir: Though you have mentioned the performance of the California Republican Convention in regard to the silver deity, the following facts have escaped you: Dan M. Burns is at present the Republican machine in this State, and was the late convention, the delegates merely carrying out his known or expressed desires. The usual committee on resolutions had formulated, and were about to report, the usual patriotic platitudes, including a declaration favoring the free and unlimited coinage of silver, etc., produced in the United States, when one gentleman, whose memory was better than that of his associates, stopped the proceedings with, "That don't go; Dan's silver mine is in Mexico." Dan's silver mine, the famous "Candelaria," is in Mexico. It did not go. The California State Republican Convention resolved for free coinage of silver—nothing more. J.

San Francisco, August 14, 1894.

## BERLIN POLICE.

To the Editor of The Nation:

Sir: One of the first discoveries made by an American or an Englishman in Berlin is that the city is too much governed. The military system has so permeated Germany that the natives are accustomed to being continually controlled and directed, like so many children; but such petty interference is intensely annoying to one who is used to think for himself.

To begin with, it is irksome to have to furnish such detailed information to the police relating to one's immediate ancestors, business, religious beliefs, etc. But although irksome it is bearable, for the annoyance is not inflicted by the whim of any single officer of the law. Nor are the police alone guilty of bullying and interfering—all the subordinate officials are tarred with the same brush. That results from the general idea that the nation is a necessary evil which exists for the benefit and through the kindness of the officials. The strata of German society are said to be, first, the Emperor and all the imperial family; next, at the Emperor's feet, are the old nobles and officers; next come the officials and police; then a great gulf is fixed, and on the other side of that great gulf what Burke called the "swinish multitude."

The rank and file of officials are protected against the general public, and therefore abuse their privileges. Some time ago a man who entered a school and began to speak insultingly to a teacher was sent to prison for fourteen days' hard labor, because the teacher must be recognized as an official. The post-office clerks are as a rule crassly impertinent. I have seen a row of men stand quietly waiting to be attended to, while a clerk, ensconced behind his little window, related some good story to a fellow-clerk who was also keeping a file of people waiting. When any one became impatient and rapped for the clerk, the latter eyed the disturber much as one would look over a new and curious animal at the Zoo, and then he continued his story.

The trouble with the Berlin police is that they interfere so often when it is unnecessary. One of them sent back a friend of mine who was in tennis flannels, and told him to go home and dress, hinting that he had forgotten to perform that operation. The Berlin policeman rarely succeeds in regulating the traffic. He first lets things get into confusion, and then begins to rave and storm, and the result is, naturally, confusion worse confounded.

A Belgian who some time ago wrote a book on Berlin stated that the police and the people were the best of friends. Nothing could be further from the truth. The policeman in Berlin is an Ishmaelite; he is against every man, and every one is against him. As a rule he is so overbearing and tyrannical that, when he does happen to be clearly in the right, public expression of sympathy is not on his side. It is no uncommon sight to see a policeman surrounded by a crowd of gibing Berliners, well-dressed people who, if in America, would be on the side of law and order. Whenever there is a dispute between the police and a wrong-doer, the crowd almost invariably sides with the culprit.

One thing, however, must be said in favor of the Berlin police—I never yet knew any one who succeeded in bribing them. M.

August 14, 1894.

To the Editor of The Nation:

Sir: Being a citizen of Germany, but for several years a resident of the United States, I take it upon myself to answer Mr. C. G. Baldwin's letter, "Decorum in Berlin," which appeared in the *Nation* of August 9. I read Mr. Baldwin's letter to a friend of mine, a German physician, who, being on a trip through the United States, practised for a short time near Chicago. He told me that he noticed park policemen in Chicago wake up sleepers on benches in the most brutal way by cuffing them with their clubs in the neck, and in one instance a policeman took a goblet with water from a neighboring fountain and poured the contents over the sleeper's face. One night my friend attended the Turn-Verein near Chicago and left his saddle-horse in a little stable behind the building. When he wanted to go home, the horse was gone. At the neighboring police station he found it, and was told that it had been taken up as a stray, and that he would have to pay a fine. A member of the Verein chanced to pass and said to my friend, "I expect you are looking for your horse. I saw a policeman take him out of the stable." Then it appeared that a policeman who used to hang around the Turn-Verein, and whom my friend had frequently invited to a glass of beer, but on that day had slighted, was the one who had

taken the horse out of the stable and brought him in as a stray.

I might relate some observations of my own concerning policemen in Denver, for instance, but will only mention that two customs have made a very disagreeable impression upon me. The one is that some large dry-goods stores will hire a big negro, put him in livery and get him a policeman's commission. You may see such a liveried guy stalking in front of their establishment and lording it over people who may want to stop with their teams in front of the store without the intention of going into it. The other custom is, that at large public shows either municipal policemen or specials are commissioned to attend the same and act as ushers. I have always wondered at the marvellous humility with which the people here will stand the insolence of such hirelings, whose antecedents are frequently of the most shady. In Germany, and particularly in Prussia, policemen have all been sergeants in the regular army, and have to show special aptitude and an exemplary conduct before entering the police force. The penalties for the abuse of official power (*Misbrauch der Amtsgewalt*) are very stringent and are strictly enforced; a well-grounded complaint from a reliable party to a police officer's superior is always taken notice of. Here in the United States I find that a complaint would frequently be utterly disregarded, and I never read of penalties being inflicted for a police officer's abuse of official power; while I know a civil suit would in most cases be entirely barren of results. In Germany we consider a policeman part of the Government, and would not degrade him with a livery or use him as an usher. Large shows furnish their own ushers, who are expected to be and in fact are infinitely more civil than the lording policemen I have found at shows here in Denver and at shows in Chicago during the World's Fair. With all respect for the constitutional liberties of the Great Republic, I am of the opinion that in Germany one is much less exposed to the arrogance and brutality of police officers than in the United States; and how could it be otherwise when the police are frequently an institution to levy taxes on vice, as the late developments in New York have shown?—Very truly yours,

EUGÈNE A. VON WINCKLER.

SEDALIA, COL., August 14, 1894.

## PROF. GOLDWIN SMITH AND THE FENTON STORY.

TO THE EDITOR OF THE NATION:

SIR: I have read with some indignation Mr. Smith's letter in your issue of the 9th in answer to Dr. Green's report to the Massachusetts Historical Society on his use of the Fenton story in his late 'History.' If he thought this report required an answer (and he could hardly afford to let it pass unnoticed), he should at least have given Dr. Green's statement in full, instead of presenting a few lines which give no accurate impression of its substance. I will not go back to the controversy at the time of Lord Mahon's 'History,' but when the late Mr. Edward J. Lowell was abroad seeking materials for his history of the Hessians in this country, he wrote to Mr. Henry Cabot Lodge in reference to this story in Mme. de Riedesel's Memoirs. Mr. Lodge made an investigation, and reported to Mr. Lowell and to the Massachusetts Historical Society that he could find no evidence to support it. Dr. Green's report was made after Mr. Smith's 'History' was published. I have not the text of the Society's reports at hand, but it is in brief that, so far, no newspaper has been found, no printed document, no manuscript, no diary, no private letter which corroborates the story, nor is there any tradition on the spot which would bear out Mme. de Riedesel. Sabine, in his 'History of the American Loyalists,' gives an account of Capt. Fenton, but makes no reference to his family. Ready as he was to do all justice to the royalists without concealing the sins of the patriots, would he have omitted this had he been able to discover any foundation for it?

I wish every person who has read Mr. Smith's letter would take pains to read the records of the Massachusetts Historical Society.

FAIR PLAY.

BAR HARBOR, August 11, 1894.

# Notes.

"MANGUM, MR., speaks to the point," says the index to the 'Biglow Papers'—no inconsiderable item in Mr. Lowell's humorous legacy; and it appears, on turning to the page indicated, that after Senator John C. Calhoun had told of his profitable white slaves "north o' Mason an' Dixon's line,"

> "'Fer all thet,' sez Mangum,
> 'Twould be better to hang 'em,
> An' so git red on 'em soon,' sez he."

This may be called a judicial opinion, since the Hon. Willie P. Mangum had been judge of the Superior Court of North Carolina. A volume on the Life and Times of this once prominent statesman is in preparation by Prof. Stephen B. Weeks of the Bureau of Education, who desires information of any kind concerning his subject. Prof. Weeks is also well along towards publication of another historical work, 'The Quakers in Virginia, the Carolinas, and Georgia, and their Settlement of the Middle West.' An unusual feature will be the charting of the Quaker settlements. Subscriptions, at $1.50, may be sent to the Johns Hopkins Press, Baltimore.

Mr. Austin Dobson is preparing for publication in the fall a second volume of his 'Eighteenth Century Vignettes,' to be issued in New York by Dodd, Mead & Co., and in London by Chatto & Windus. Most of the papers to be included in this volume have already appeared here and there in the magazines, but the longest of them all, an essay on Lady Mary Coke, will be printed for the first time in the book. Mr. Dobson has also written a preface for a volume of 'Old English Songs,' illustrated by Mr. Hugh Thomson and to be published by Macmillan & Co.

Frederick Warne & Co. have in press 'Cameos of Literature from Standard Authors'; and 'Quiet Stories from an Old Woman's Garden,' by Alison McLean.

'Raphael's Sistine Madonna,' a critical and interpretative study, illustrated with photogravures, will be luxuriously brought out by D. Appleton & Co. The author is Dr. Mombert, formerly American chaplain at Dresden.

The Century Company's principal announcement for October is Mrs. Edwina Booth Grossmann's life of her father, with numerous illustrations, in two editions, one *de luxe*. Mrs. Mary Mapes Dodge's 'The Land of Pluck,' stories and sketches, mainly of Holland, and 'When Life is Young,' poems for young people, both illustrated, are also in preparation, together with C. F. Lummis's Pueblo Indian folk-lore tales, 'The Man Who Married the Moon.' Further announcements are 'The Mountains of California,' by John Muir; 'The Century Book for Young Americans,' the story of the Government, by Elbridge S. Brooks; 'P'tit Matinic' Monotones,' sketches of life and character on the Nova Scotia coast, by George Wharton Edwards; 'The Reign of Queen Anne,' by Mrs. Oliphant; 'Five Books of Song,' the complete poetic work, partly new, of Richard Watson Gilder; 'Writing to Rosina,' by Wm. H. Bishop; and 'When All the Woods Are Green,' a story of the Canadian forest, by Dr. S. Weir Mitchell.

Conformable to the new architecture of Bowdoin College and to the festival of its centenary is the stylish General Catalogue just issued in green, white, and gold (Boston: W. B. Clarke & Co.), with numerous illustrations of campus and buildings. Its price, one dollar, is nominal. Besides the customary lists, not wanting in many illustrious names of officers and graduates, this handsome volume contains a sketch, much to be praised for its readability, of the history of the college, written by the librarian, Mr. George T. Little. Bowdoin's annals possess considerable interest for one who studies the growth of the higher education in New England particularly, and upon many items the reader happens with as much surprise as the visitor to the sand flat of Brunswick does upon the college itself. Like other colleges, the alma mater of Longfellow and Hawthorne has seen its literary societies languish under the baneful influence of the Greek-Letter societies. The most conspicuous incident of student life was the revolt in 1874 of the three lower classes against compulsory military drill, with the result that this exercise was abandoned. The college never owed any part of its funds, we are told, to recourse to a lottery; but one wonders whether this would not have been preferable to financial rehabilitation through a sectarian dedication in 1841, after the panic of 1837. "Subsequent gifts have been conditioned upon the denominational character of the college, which there has been little disposition, of late years, to question."

The Great Commanders Series (D. Appleton & Co.) has a new volume, 'General Washington,' by Gen. Bradley T. Johnson. The author frankly recognizes the fact that the numerous biographies of Washington make his work chiefly that of compilation and selection. In accordance with the leading idea of the series, the military character and history of the great man are given the chief prominence, and a successful effort is made to bring the principal events of his career within the limits of the single handy volumes to which the series is limited. Raciness is occasionally added by more or less elaborate comparisons between the rebel of 1776 and of 1861; and the author's experience as a Confederate soldier is used to give point to similarities of events, or interest to military operations in which the earlier and later wars occupied the same geographical theatre.

In 'Pain' (J. B. Lippincott Co.) Dr. J. Leonard Corning offers to his profession, and incidentally to the public, his views on a subject of universal interest. Pain he defines as "the feeling (perception) evolved by over-stimulation of the nerves of special and common sensation," which is a doubtful use of the word perception and hardly includes the neuralgia of anæmia. The essay leads up to several new methods which are ingenious, simple, and frequently effective, for the relief of pain by local surgical interference and by the use of compressed air. In the latter case the patient is immersed in an air-bath where the pressure of several atmospheres may be secured if required. Dr. Corning's style is so exceedingly prolix that it

is a serious trial to read what he has to say, but if the manner of saying it be disregarded, the matter is well worth consideration.

M. Anatole France wrote for the *Revue de Paris* a "modern" novel, 'Le Lys rouge,' now published in book form (Paris: Calmann Lévy). It is a beautiful piece of literary workmanship, and so far is heartily commended to those who care for the art only without regard to the subject. Others will be apt to wonder once more why one after the other the best French writers cannot find it in their hearts to write on some other subject than, for them, the threadbare theme of a married woman's illicit loves.

Another volume of the "Collection Lemerre illustrée" comes to hand (New York: Meyer Bros. & Co.), and this time it is André Theuriet who is the chosen author, and his pretty, satirical, semi-idyllic 'Rose-Lise' the story. That it is delightfully told, that it breathes the fragrance of the country, need not be said, and that the publishers have turned out a dainty volume is also matter of course.

There is something of Montaigne's charm in the second volume, just published, of François Coppée's 'Mon Franc Parler' (Paris: Lemerre; New York: Meyer Bros. & Co.). It is frank, and the book does not belie its title. There are even opinions in it that may be called bold as well as true. Coppée, happily, is not afraid of speaking out, and in "Après les fêtes," "Discours académiques," and "L'Instruction et le Peuple," he has said many things which many think but few dare avow. The whole volume is excellent reading.

Parts 6-10 of Maspero's 'Histoire Ancienne des Peuples d'Orient' (Paris: Hachette; New York: Dyrsen & Pfeiffer) dispose of the Egyptian deities and begin on the legendary history of Egypt. The illustrations are extremely numerous and are of fine quality.

'Auguste Comte und seine Bedeutung für die Entwickelung der Socialwissenschaften,' by Dr. Heinrich Waentig (Leipzig: Duncker & Humblot), is the first number of the second volume of the series known as "Staats- und socialwissenschaftliche Beiträge," edited by A. von Miaskowski. The author gives a succinct survey of the rise and growth of Comte's positive philosophy, and seeks to trace its influence on the French, English, and German schools of political economy and sociology—an influence which he greatly overestimates, especially in the case of Herbert Spencer; on the other hand, the indebtedness of John Stuart Mill to the French positivist is undeniable. The book is interesting and instructive, but, while containing a full bibliography, loses much of its value through the lack of an index.

The fourth and fifth volumes of the second collection of biographies bearing the general title of 'Führende Geister,' edited by Anton Bettelheim and published by Hofmann & Co., Berlin, are devoted to a life of Moltke by Dr. Max Jähns, a retired lieutenant-colonel of the Prussian army. Only the first part, called "Lehr- und Wanderjahre" and covering the period from Moltke's birth (Nov. 2, 1800) to his appointment as chief of the general staff (September 18, 1858), has as yet appeared. The book is a condensation and popularization of the materials already printed in the 'Collected Works' of Moltke which have been issued since his death, and will serve a good purpose in enabling the reader to whom these voluminous publications are not accessible to study the character and career of this excellent man and eminent strategist.

In connection with the recent celebration of the fourth centenary of Correggio at Parma has been published 'Il Correggio nei libri,' a bibliography of books which treat of this artist's life and works (Parma: L. Battei). It fills sixty pages.

The second number of *Bibliographica* fully maintains the high level achieved by the first, and Mr. Pollard may be congratulated on the success of his venture. Among the more technical articles are Mr. R. C. Christie's on the "Chronology of the Early Aldines," and Mr. Maunde Thompson's on "English Illuminated MSS. A. D. 700–1066." Mr. Falconer Madan has prepared an interesting and richly illustrated paper on the "Early Representations of the Printing Press." But the two essays most likely to interest the general reader are grouped together as "Two English Bookmen," under which head Mr. Wheatley describes the library of Pepys now preserved in his own cases at Magdalen College, Cambridge, and Mr. Austin Dobson writes about the books of Henry Fielding, defending him from a casual slur of Thackeray's, and showing that the author of 'Tom Jones' was really a scholar, loving his classics and having them by him constantly.

The most noteworthy article in the August number of the *Scottish Geographical Magazine* is a condensed description of the physical geography of Alaska, by Israel C. Russell, for several years connected with the United States Coast Survey. With much that is purely technical, he joins interesting statements in regard to the subsoil ice, the growth of the tundras, and the most promising regions for future explorers. He also gives a timely note of warning as to the danger of the destruction of the forests, and particularly of the yellow cedar, a wood exceptionally valuable for ship-building. "The supply is not so great as has frequently been stated, and, should the forests of Alaska be thrown open to lumbermen, the tree will soon be exterminated."

The principal articles in *Petermann's Mitteilungen* for July are an orographical and geological description of the Cordilleras of Southern Chile, accompanied by a map, and the conclusion of Baron von Toll's interesting account of his Siberian journey. In this he tells of the annual migrations of the men and the wild reindeer, which are mostly taken at this time. The lemmings migrate triennially, as they destroy the vegetation of the tundra in just three years. One of the most striking of his experiences was the sudden breaking of the deathlike stillness of the tundra by the coming of countless swarms of birds. He writes of the natives in the highest terms, as men who have learned that the hard conditions of their life necessitate their sustaining the most friendly relations with each other. Consequently there is found among them a surprisingly high morality, according to European standards even; their three deadly sins being adultery, slander, and theft. Their most profitable industry, after hunting and fishing, is the collecting the bones of the mammoth. As success in this is entirely a matter of chance, in which skill plays no part, the occupation exerts an unfavorable influence upon their characters, developing in them the gambler's spirit. The editor, Dr. Supan, contributes an elaborate summary of facts as to the nationalities of the Prussian kingdom as shown by the census of 1890.

—In the *William and Mary College Quarterly* for July, Mr. Edward W. James completes his transcript from the third (federal) census of Princess Anne County, Va., in respect to its enumeration of slave-owners. In the January number he gave the names of those who in 1810, owned ten or more slaves; he now supplies the names of the remainder, with their respective holdings. In all, he reckons up 646 slave owners of 3,926 slaves in a population of 9,500, which was a little less than one-hundredth of the population of the whole State, so that the total number of Virginian slave-owners would (if the ratio could be relied upon) be 65,000. Now, in 1810, Virginia contained almost one-third of the entire slave population of the country, namely, 392,516 out of 1,191,364; and this would make the total slaveholding body at the South 195,000. In 1850, when the number of slaves in the United States had nearly trebled (2.7), the number of slave-owners might, therefore, have grown correspondingly to 525,000. In that year, however, the Southern statistician De Bow would venture no higher estimate than 347,525, of whom 45 per cent. (160,974) he set down as hirers. We cannot be sure, of course, that Princess Anne County, though it chances to show as nearly one-hundredth of the slaves as of the total population of Virginia, exhibits the average proportion of slaves and owners; indeed, the seaboard counties were, down to 1832, always contending for the perpetuation of slavery, with its political privileges, State and national, against those in the mountain districts and what is now West Virginia. Hence it is more than probable that the number of slave-owners fell considerably short of 60,000 in 1810. Again, the average number of slaves held by each owner in Princess Anne County was but 6, whereas in Kentucky in 1850 it appears to have been 22, and it is notorious that the size of holdings increased enormously in passing to the South Atlantic and Gulf States. While Mr. James's data, therefore, standing alone, would help us to the inference that the number of slaveholders in the United States at the time of the Compromise of 1850 did not exceed 525,000, the considerations advanced above tend to confirm De Bow's caution in stopping short at 350,000. What appears singular is, that the United States marshal in Virginia should collect statistics never published in connection with any federal census, and, so far as we know, never called for. Mr. James would do a good service if he were to ascertain whether the same thing happened in 1820 for Princess Anne.

—The most interesting and valuable part of British East Africa, judging by Mr. C. W. Hobley's account in the *Geographical Journal* for August, is Kikuyuland. It lies at a considerable height above the Masai plains, and is described as a "splendid, park-like, gently rolling country, thickly studded with small trees," a "land of wild flowers and sweet-smelling grasses." These grow in a wonderful variety in hedgerows between the paths and the plantations, so that, but for the banana groves, the traveller might imagine himself in an English lane. The ground is carefully cultivated, the men working in the fields quite as much as the women, contrary to the usual custom in Africa. They are also the only tribe, in the interior of this region at least, "who appreciate the value of manures in agriculture." The chief obstacle to the prosperity of the people is the cattle-raids of the Masai from the south, as in other parts of the country it is the slave-raids of the Somali. The remainder of the article treats particularly of the region watered by the River Tana, its tribes, their customs, superstitions, and industries, as well as the fauna. The value of this possession to

England seems as yet very problematical. Much more encouraging is Mr. T. J. Alldridge's account of the Hinterland of Sierra Leone. Till recently this has been devastated by continual tribal wars, but, by the efforts of the British Government, the prominent chiefs have been induced to give these up and to open roads and foster trade. The author was one of the treaty commissioners, and in this capacity visited tribes which had never before seen a white man. These lived in towns "beautifully clean, admirably kept, and very picturesque in appearance." Outside of every large village is a cleared place, where the chiefs and their followers assemble to decide upon matters affecting the community. These debates are conducted with the greatest ceremony and decorum. The tribe's principal industry is making cotton cloth; the men doing the weaving, the women the ginning and spinning. The cloth is dyed with an "artistic treatment of colors," and the patterns are very diverse. The women are also expert at pottery-making. At a great market which the author attended, a large variety of articles were offered for barter, the chief currency being long strips of iron in shape like a T-square. There was no disorder, in the absence of intoxicating liquor of any kind. Two curious secret organizations, one for men and boys, the other for women and girls, are described, as well as other customs. The recent landslip at Gohna, in the headwaters of the Ganges, is described with the aid of a map and plans.

—The second number of 'The Yellow Book' (London: Elkin Mathews & John Lane; Boston: Copeland & Day), continues the research for eccentricity of the first, and contains much the same mixture of good and bad. The cover is not as offensive in design as the first one, but exhibits the same crudity of color. Among the pictures, the good is represented by an exquisite drawing of Henry James by John Sargent, which shows a side of that artist's talent not generally known. He is a superb technician with the brush, but perhaps only his friends have known upon what thorough and delicate draughtsmanship his free handling is based. Next to this comes a "Renaissance of Venus" by Walter Crane, which has grace and charm, but not strength. The rest is "impressionism" and affectation, the acme of which is perhaps reached in Mr. P. Wilson Steer's "Portrait of Himself," in which most of the canvas is occupied by the figure of a girl *en chemise* putting on her shoe, while the artist is crowded into the background, and his head is entirely cut off by the frame. Nearly equal to this, however, and much worse in execution, is "A Reminiscence of 'The Transgressor,'" by Francis Forster, with the left leg and foot of one of the two figures appearing at the extreme edge of the composition. Mr. Aubrey Beardsley is as conspicuous by his vapid and vulgar attempts at French *chic* as before. In a review of the first number printed in the second, which is one of the novelties the editors have introduced, one is surprised to find Mr. Hamerton taking Mr. Beardsley quite seriously, and even calling him "a man of genius"! Another echo of No. 1 is Mr. Max Beerbohm's explanation that his "Defence of Cosmetics" is a "hoax" and a "burlesque," and that the critics, whom he violently berates, have made fools of themselves. Perhaps he is burlesquing again, for the style of his diatribe is nearly as full of affectations as was that of the original essay. Mr. James contributes another of his subtle and circumlocutory studies, and there is a little poem by Austin Dobson. The rest of the contents we will pass in silence.

—A now touching and almost tender interest attaches to a small volume from the private printing-press of H. Daniel, Oxford. It bears the title 'An Imaginary Portrait, by Walter Pater: The Child in the House,' and is nothing less than an exquisite record of the earliest recoverable impressions of Mr. Pater's own rare childhood. Mr. Pater's first published essay appeared when he was but sixteen years of age. His graceful and poetical reminiscence of his first psychical unfolding gives still stronger evidence of his extraordinarily early development. The 'Portrait' bears the date 1878, in which year it was published in *Macmillan's Magazine*. It has never, until now, appeared in book form, owing, it is said, to its personal character. Its present appearance was made at a sale, on June 12 and 13, in Worcester College Gardens, for the benefit of the parish of Saint Thomas the Martyr, Oxford, Mr. Pater having allowed Mr. and Mrs. Daniel to print it for the purpose. The edition, limited to 250 copies, is printed in Fell type, with the long *s*, on French hand made paper, with all the care and taste which distinguish the Daniel press. There are in all only sixty-one broad-margined pages, but they will be conned by all lovers of the beautiful in literature with a warmth and eagerness proportioned to their contents and not their number.

—Edwin Bormann is the author and publisher at Leipzig (New York: Westermann, and G. E Stechert) of the latest contribution to the Baconian side of the Shakspere controversy. 'Das Shakespeare-Geheimniss' is the title of his work, which begins with the familiar mystery that so obscure a person as Shakspere could write so profoundly and intellectually as to rank with the greatest poets and dramatists of all time, and ends with the contention that Bacon's 'Advancement of Learning' consisted of two parts—the one part in scientific prose under his own name, the other, designed as a parable for posterity, in dramatic form under the pseudonym of "William Shakspere." What lies between consists of a parallel in several sections between the plays and Bacon's science, as, the "Tempest," a dramatic parable in the sense of Bacon's natural philosophy; "Hamlet" in the sense of Bacon's anthropology; "Love's Labour's Lost" in the sense of Bacon's doctrine of light; the historical plays complementary to Bacon's 'Henry the Seventh,' etc. It is not until his "Schlusswort" is reached that Mr. Bormann makes any reference to the origin of the debate to which he brings more soberness and scholarly industry and not less plausibility than his predecessors. He praises Miss Delia Bacon, of course, as the pioneer, thanks Mr. Appleton Morgan for having (in his 'Shaksperian Myth') turned his (Bormann's) attention to the subject, and professes little indebtedness to Ignatius Donnelly, whose cryptogrammic discovery of state secrets he slightingly compares with his own exhibition of the marvellously secret connection between Bacon's science and the poetry of the dramas. Mrs. Pott's mosaic of coincidences he does not overrate. He convicts Spedding of being ignorant of the earliest German editions of Bacon. He recalls Gervinus's parallel of Bacon and Shakspere, which just misses the illuminating surmise that the writings of the two men are but two manifestations of the same mind. Finally, he declares that no stage can rightly produce "Shakspere" without having studied Bacon.

—All this is displayed for the incredulous on a generous page in Roman type. The author has supplemented his text with a very welcome array of facsimiles: of portraits—Bacon, his father, Queen Elizabeth, Essex, James I., Charles I., Buckingham, Inigo Jones, Ben Jonson, Shakspere; of MSS., title-pages, and specimen pages of early editions of Bacon's works and of Shakspere's plays, etc., etc.; of plans, maps, play-houses, and views of Gorhambury near St. Alban's, and of Bacon's resting-place. A singularly minute piece of evidence which Herr Bormann thus introduces pictorially is a certain tail-piece which, with slight variations, is found twice in the folio edition of Paracelsus's Complete Works published at Strassburg in 1616, twenty-five times in the Shakspere folio of 1623, and three times in the Frankfort folio edition of Bacon's Complete Works (1665). Our respect for the relative sobriety of this champion of Bacon is shaken when he discovers in this rude arabesque, with its central figure of a satyr, "the Pan-idea of the natural philosophers of the sixteenth and seventeenth centuries." We accept his greeting, "Viventibus et posteris salutem," but for a further examination we cheerfully resign him to posterity.

—The surprising increase of the population of Japan since the fall of feudalism in 1868 is a subject of interest to the foreign student, and also for congratulation or anxiety to the native statesman and economist. In the old days of seclusion smallpox, famine, infanticide, the restrictions upon marriage and the wide prevalence of licensed prostitution kept the population nearly stationary, even in time of profound peace. The removal of these has powerfully affected the census. In 1871 the population of the empire was about 33,100,000; in 1875, 34,000,000; in 1880, 36,300,000; in 1885, 38,100,000; in 1890, 40,400,000, and in 1892 (December 31), 41,089,940. Railways and steamers have annihilated famines, vaccination has made the pitted face, once so general, almost as much of a curiosity as a victim of scurvy, while liberty has encouraged the people to progress and activity. Millions of men and women can now afford to have a family and possess a home who were "clouds" or "not human" under the feudalism that once cramped the nation in bands of iron. The old epidemics, once irremediable, are now very rare, because science and law are able to cope with them. The severity of the criminal law, which every year called for a rosary of thousands of heads (against the present figure of fewer than two hundred capital executions per annum), has been mitigated. The old fatalism, expressed in the popular *shigata ga nai* (don't care), inculcated by a stagnant religion that swamped the freedom of the will in a too rigid application of the doctrine of cause and effect (*ingwa*), is no longer believed as of old. In a word, a people naturally happy as well as prolific now obeys the laws of nature, with the result of surprising increase in wealth, comfort, and numbers.

—In a paper read before the Asiatic Society of Japan, in Tokio, June 27, by Prof. Garrett Droppers, on "The Population of Japan during the Tokugawa Period," the contrast between the nineteenth and each of the previous centuries was strikingly brought out. The first census taken under the Tokugawas was in 1721 and the last in 1846, but the figures show an increase during this century and a quarter of only 900,000, or less than the increase of any *five years* since 1870. The official figures are: 1721, 26,000,000; 1750, 25,900,-

000; 1780, 26.000,000; 1792, 24,800,000; 1816, 25,600,000; 1846, 26,900,000. To these figures about two millions should be added for the *samurai*, nobles, Ainos, *eta*, and *hi-nin* (not human) not reckoned in the census as "the people." Prof. Droppers gave vivid accounts from eye-witnesses of several of the very severe famines in old times, when dogs and rats were eaten and human flesh became human food. The writer of this note has heard similar testimony, and vividly remembers the long, wide, and high heaps near the cremation-houses containing the ashes of the thousands of victims of famine. The corpses were quickly cremated to prevent pestilence. Fear, anxiety, and insufficient nourishment also attended upon the steps of famine to swell the list of the deaths. Under these circumstances, the temper of the Japanese people became that of submission to the inevitable. Shortsightedness in commercial matters, an eye to immediate rather than remote gain, and excessive timidity and conservatism, are charged to the Japanese by foreigners. It is manifest, however, that the spirit of the Japanese is now becoming more resolute, and that happiness as well as courage in every-day affairs is on the increase on a national scale. It is a fascinating question, but one not to be discussed here, whether Buddhism, which has so long dominated the Japanese popular mind, can hold its own under the changed conditions.

## ALCHEMY AND CHEMISTRY.

*The Alchemical Essence and the Chemical Element:* An Episode in the Quest of the Unchanging. By M. M. Pattison Muir. Longmans. 1894.

*Law and Theory in Chemistry:* A Companion Book for Students. By Douglas Carnegie, sometime Scholar and Demonstrator in Chemistry of Gonville and Caius College, Cambridge. Longmans. 1894.

Two very eminent chemists have devoted a considerable part of their lives to the elucidation of alchemy, Kopp and Berthelot. Their genius and skill as chemists do not at all come into play in this undertaking, although, of course, some proficiency in chemistry is requisite even to read alchemical treatises, not to speak of appreciating them. Kopp's is a solid compendium of two octavo volumes, mostly of fine print, which gives the titles of an enormous number of writings, and a good deal of general information, but really little about the inside of alchemical treatises. It dwells particularly on the alchemy that just preceded modern chemistry. It was published in 1886. Berthelot's labors, mostly more recent, are of a totally different and higher kind, consisting in the transcription, translation, and elucidation of a number of Greek papyri about as old as the Christian era, together with a few mediæval manuscripts which throw some light on the papyri. He has thus completely opened up to us the Egyptian alchemy, while leaving that of western Europe untouched. We have, besides, a work which is one of the greatest psychological curiosities of literature. Its date is 1869. It is considerably longer than Green's 'Short History of the English People.' Its peculiarity is that its author, Dr. Gottlieb Latz, professes himself to be a believer in the doctrine. There would be nothing surprising about that were it not that the tone is decidedly critical and even sceptical. He drops such expressions as, "Alchemy is not an inquiry but a speculation." What he calls "the gold-making swindle," and by other contemptuous designations, is suggested as the explanation of every boast of the adept. He sees in alchemy a general mystical doctrine with applications to man, to plants, to metals. It has had, he tells us, various forms, but all are interpretations of the Smaragdine Table. This is certainly in part true, and Latz makes the mediæval alchemists more intelligible to us than anybody else has done, even if we do not believe the Smaragdine Table has played the part he attributes to it. But it is astounding to find a medical man, able to throw light on a difficult problem, who yet attributes wonderful powers to seven "arcana," which are, (1) sulphuric acid, (2) iron, (3) carbonate of soda, (4) Chili saltpetre, (5) solution of sulphide of ammonium, (6) *Pulver solaris ruber, i. e.*, a mixture of red oxide of mercury with pentasulphide of antimony, (7) *Pulver solaris niger, i. e.*, a mixture of red oxide of mercury with tersulphide of antimony. We mention the work because it is not very well known.

But all three books hardly afford us a living mental portraiture of the mediæval alchemist. Of the externals of the man we have several contemporary pictures; of modern psychological studies perhaps those of Dumas and Balzac are not quite worthless; but as to the state of the mediæval alchemist's intellect we have had no popular delineation before this sketch by Mr. Pattison Muir, and this is very true to nature. But more we cannot say for his work.

Mr. Carnegie's is a little volume of two hundred and odd pages of small octavo about the history and philosophy of chemistry, from the alchemists to this day. It is not intended for beginners, but to "recapitulate and coördinate the more important principles of the science, before proceeding to more detailed and advanced works." Certainly so small a volume must be inadequate to the needs of adult and serious students; but there are a good many practical chemists who are too negligent of the marvellous progress that chemical dynamics has made of late years, and of its growing practical importance, and this volume will serve to show them that they must lose no time in studying Ostwald's 'Allgemeines Lehrbuch,' from which a large part of Mr. Carnegie's volume has been abridged, and which, by the way, ought to be translated entire. Moreover, there are others, bright students, even boys, and a few general readers, to whom, if they know how to read a book they cannot entirely comprehend, this volume may lift a veil, and display, if only confusedly to those not well acquainted with chemistry, what a vast field is being worked and with what success.

Alchemy is treated by Mr. Carnegie in the slight, we had almost said the facetious, vein which is inevitable when history is made subservient to doctrine. Indeed, the whole first chapter, which carries us to phlogiston, is of small accuracy. Thus, having finished with the alchemists, the first sentence following is: "With the Benedictine monk, Basil Valentine, begins the period of iatrochemistry, . . . during which transmutation was in abeyance." It is true that the author of the 'Triumph-Wagen' calls himself "Basilius Valentinus, ein Bruder des geschwornen Ordens S. Benedicti." But this cannot be true, because the Emperor Maximilian instituted inquiries in 1515 to find out who Basil Valentine was, and completely failed. Now the general catalogue of the order, kept at Rome, was open to him, and therefore it is impossible there ever should have been a Benedictine of that name. The author of the books was in all probability living in 1515. Dr. Latz will not admit that any of the other writings which pass under the name of Basil Valentine are by the author of the 'Triumph-Wagen,' because they do not accord with the cryptic interpretation which he traces out for this; but to ordinary men they seem wonderfully like that in style, and certainly in strong contrast with earlier alchemical works, so that they must at any rate be classed with the works of the "spagiros," as they call themselves.* Now these writings have much to do with transmutation. Mr. Carnegie's next sentence states that "heretofore the apothecaries had prescribed purely vegetable preparations only, but now we find mineral specifics contesting the field with them and partially replacing them." This is a mistake. To give no other refutation of it, Avicenna had been translated by Gherardus Cremonensis in the twelfth century, and that translation still in use, with all the corrections noted, gives as medicaments antimonium, ammoniacum, alaunoc et alahabar (*i. e.*, graphite, or possibly $MoS_2$), asius, alæ, argentum vivum, atrimentum, arsenicum, azul, ambra, aranea, argentum, alumen, adeps, acetum, aurum, etc.

Van Helmont is passed by with bare mention in a footnote, albeit he did much toward causing gases to be conceived as corporeal substances, and invoked the balance to decide a chemical question, a stupendous idea had he only not unfortunately overlooked the possibility that substance concreted from gases might weigh something. Coming down to Robert Boyle, Mr. Carnegie speaks of his style as "language which knows nothing of the mystic and rococo style of alchemistical literature." Now it is true that alchemists are all mystics, and that the iatrochemists are often bombastic; but to say that the style of the mediæval alchemists is rococo, or florid, is exactly like making the same accusation against the Cook's Own Book. Their writings are as dry as possible. Everybody knows what Boyle's style is, because Swift's 'Meditation on a Broomstick' imitates it to perfection, except in one particular, his quite inimitable long-windedness.

The second chapter is devoted to the Phlogistic Period. In the third, the historical arrangement is abandoned, and the treatment of mixtures is considered in a manner which fails to leave a very definite impression on the reader's mind. In the fourth, on the Atomic Theory, there is a return to the first method, and a most interesting, though not quite full, narrative is given of the various waves of opinion which swept over the chemical world from Dalton to Williamson. Mr. Carnegie says it seems as if Berzelius were *lucky* about his atomic weights. *Luck* is a self-contradictory idea; but there is perhaps a sagacity whose reasoning is too subtle and nice for its possessor ever to give a satisfactory account of it. Dalton and others seem to have been possessed by such inspiration-like insight when they accepted the Atomic Theory. It is now eighty-six years since men to be listened to have been very clearly and very pertinently asking those who hold that the facts of chemistry support the atomic theory, why it is that 1,234,567 atoms of hydrogen might not form a saturated compound with 617,283 atoms of oxygen, unless by virtue of a special law which would give rise to simple compounds though there were no atoms? And this question, incessantly asked, has never been answered. By this time facts non-chemical have caused almost all physicists to believe in atoms. But it would aid the chemical philo-

*The 'Century Dictionary' attributes the word "Spagiric" to Paracelsus; but it is certainly older.

sophy, and perhaps throw much light on it, if the secret reasons which led chemists to accept the theory before the physical proofs were known could be ascertained. This chapter ends with a discussion of molecules which is hardly in continuity with the first part, but is worthy of attention by itself.

The remainder of the volume sketches rather too slightly the most modern theories by which chemists are laying siege to their great problem. That problem is this: The periodic law makes all the properties of the elements to be dependent upon their atomic weights alone. It is required, then, to produce an hypothesis from which may be deduced from the atomic weights all the physical and chemical properties with mathematical strictness. It is also requisite that this hypothesis should explain why the atomic weights are precisely what they are—that of oxygen, for instance, 15.94 instead of 16, etc. A few years ago the idea of setting up such an aim, even as a remote one, would have seemed chimerical, and it may seem so to-day to many chemists; but in a few years more it will be in full sight of all as the Alp which our army has to mount.

One question which it is very desirable to settle as early as possible is, whether the forces existing between atoms are polar or not. At first blush, it seems as if they must be so, because of the fact of saturation. But Van't Hoff suggests that the surfaces of atoms are level surfaces, with points of maximum attraction. In that case, saturation consists in having all the places where atoms would be strongly attracted occupied. This theory seems to involve the conception that an atom has a surface and a size. Yet the Boscovitchian idea may be true just the same, for that theory virtually gives to the atom a surface, namely, the surface of the space within which the central force is repulsive, while outside of that it is attractive. Prof. Mayer made some years ago a very beautiful experiment by which little objects floating on water were made to repel one another if very near together, but attract (or rather, all were attracted towards a common centre, which is the same in effect) when at greater distances. The result was that they arranged themselves in regular clusters strongly suggestive of chemical molecules. If we add the hypothesis of their being in constant motion without resistance, we seem to have all the elements requisite for a foundation for chemical dynamics without polarity in the forces. Prout's law would also be accounted for in this way; for if two Boscovitchian atoms have attractions which increase inversely as a high power of the distance with no repulsion for smaller distances, one may easily encounter another in such a way as to move in narrowing spirals around it for ever; and nothing would be likely ever to separate them. The inexactitude of Prout's law is a fact calling for a distinct hypothesis.

The manner in which Mr. Carnegie has set forth the tridimensional graphs of Wislicenus, Le Bel, Van't Hoff, and Guye, and Horstmann's application of thermodynamics to chemical processes, is extremely clear, and calculated to set the student to work to learn more of these matters. The author is thoroughly versed in all the modern ideas, thinks with rare clearness, and writes with peculiar simplicity, grace, and charm.

## NEWTON'S RUN THROUGH RUSSIA.

A *Run through Russia:* The Story of a Visit to Count Tolstoi. By W. W. Newton. Hartford: The Student Publishing Company.

After all the books, articles, and reviews, all more or less competent, which have been written about Count L. N. Tolstoi, admiration must needs be of the most enthusiastic character to induce a man to write a volume of more than fifty thousand words on the subject, when his personal knowledge of it is limited to half-a-dozen hours' intercourse, at the most, with the famous author. The actual conversation is contained in the brief space of four short pages, and imparts no information which the world has not already received direct from Count Tolstoi in his own books. This is not Mr. Newton's fault; his will to ask questions was of the best. But the Count is not communicative to entire strangers, and he has had nothing really new to say for a long time past in his books, which are of much later date than those here reported in the spring of 1889, all being, substantially, only extreme statements of opinions long ago shadowed forth or announced in less detail.

We speak advisedly of this book as consisting of a certain number of words. It certainly was a singular idea to make such a compilation from Count Tolstoi's own works, from the books and magazine articles of other writers, from stray newspaper reviews and paragraphs (all duly credited, we are glad to see), under the title, "The Story of a Visit to Count Tolstoi," since all these quotations, with the possible exception of the newspaper articles, have long been familiar to the public. The writer's laudations of Count Tolstoi as a philosophical and theological thinker, and the grounds stated for his enthusiasm over the great Russian author, seem singular on the part of an Episcopal clergyman, who, presumably, has been trained to logical thinking in those lines. On p. 87 he ranks John the Baptist, Buddha, Tolstoi, George Fox, William Penn, and Christ as equal gods, and on p. 119 he says of Tolstoi's discourses called 'The Spirit of Christ's Teachings,' that they "reveal a depth of spiritual insight and an originality of exegesis in the study of the Bible which remind us of the fearless common sense of John Bunyan in his 'Pilgrim's Progress,' or Sir Thomas Browne in his 'Religio Medici,' and prepare us for that original interpretation of the Scriptures which marks the pages of his later theological work, 'My Religion.'" Not many of Mr. Newton's brethren in the Episcopal Church are likely to agree with him here, nor are many laymen likely to be converted. The plain truth of the matter is, that Count Tolstoi has a great genius for novel-writing, in his earlier style, but that he has neither a philosophical nor a theological mind; nor has he the training which might have rendered his deficiencies less apparent.

Mr. Newton must be credited with one very startling novelty, namely, his description of Count Tolstoi as "a diminutive, sensitive-looking man"! In general, it must be said of his powers of observation, that they are far from acute or accurate. As his entire stay in the country, including the railway journeys of entrance and exit, was limited, apparently, to ten days, it could hardly be expected from him that he should be infallible on fundamental questions of politics and religion; but we might look for correct reports of ordinary occurrences which fell under his eye. It is worth while to call attention to a few of his errors, because, while he records his observations with great positiveness, they by no means always agree among themselves

We ought not to expect correct transliteration of Russian words, so we may pass over that point, merely remarking that a three-horse sledge is a troika, but not a tritska nor a troitska; that *Gospodi pomilou* (Lord, have mercy!) is the proper form of the refrain in the Liturgy, not "Gospidi pomilon." But surely the author and the three men to whom he acknowledges indebtedness in the preface should have been able, by their combined efforts and a little consultation of the guide-books and other works quoted, to avoid such errors as "Quarenghi" for Guarenghi, "Arvazovsky" for Aivazovsky, "St. John Nevski" for St. Alexander Nevski; the assertions that the river Neva flows from the non-existent "Lake Olga" instead of Lake Ladoga; that the Czars are always crowned, and that all the Romanoff princes have been buried, in the Cathedral of the Annunciation, Moscow; and that Ivan the Terrible's tomb is built as an annex just outside the church. The Czars are all crowned in the Cathedral of the Assumption; in the olden times they were baptized and married in the Cathedral of the Annunciation; down to the time of Peter the Great they were buried in the Cathedral of St. Michael Archangel, since which they have all been buried in St. Petersburg, though the author overlooks it in his description of the Fortress of Sts. Peter and Paul. Ivan the Terrible's tomb stands in a chapel near the altar of St. Michael's, and it is the tomb of Vasily Shuisky which stands in a separate chapel, adjoining the cathedral, because he was a usurper.

The author quotes Murray to the effect that the word Kremlin cannot be traced to any certain source; whereas the Russian form *kreml* is well known to be a Tatar word meaning fortress. He saw peasants gathering pussy-willows along the riverside, "with which they would then proceed to the different shrines and icons within the Kremlin walls, there to dedicate them to their favorite saint and patron." Had he inquired, he would have discovered that these willow branches were for use on Palm Sunday, in the character of palms, as the only green thing to be had at that season, and that they are never put up over the images in church; that custom being restricted to the holy pictures in private dwellings.

On page 24 Mr. Newton says: "We regret to state that the custom in vogue whereby the drozhky driver was to consider himself rejected was the familiar American method of spitting on the rejected candidate." We should like to inquire where, in America, this "familiar method" is in use, and to remark that it certainly is not in vogue in St. Petersburg. It would have required a good deal of saliva to spit on each one of the army of candidates for custom which he describes. What happened was, simply, that, seeing the party emerge from an expensive hotel, the cabman asked an exorbitant price, as is generally the case in Russia, and their guide went through the form, common among the Russian lower classes, of spitting aside, not on them, to signify his scorn of their extortionate demands. That guide evidently understood what was expected of him, and earned his wages with extravagant stories which a little inquiry would have disproved. He trusted to the party's innocence and lack of acquaintance to believe in him, and they justified his opinion of them. For example, the author and a friend had been calling at the Winter Palace, where they shared in the afternoon tea of a court lady's weekly reception, evidently mistaking it for a "lunch" given for them, since it is so stated, where the hostess was working on an altar

carpet for a church, not on "an immense sampler," and where the lackey was clad in dark green, scarlet and gold braid, but was not "an elegance in blue daisies and white," whatever that may mean. We cite these errors to illustrate the general carelessness of the author's observation. When they rejoined their guide at the door, the latter said to them: "Stretch your necks, gentlemen. Look up the staircase! That is the Grand Duke Vladimir, brother of the Czar; he is going to a state dinner at the Winter Palace—the Czar is up stairs on the second landing." Alas for the guide's veracity and his patrons' credulity! No state dinner could possibly be given on Saturday. Sunday begins at sundown, theoretically; all Russians are supposed to attend the evening service in church; even the State theatres give no performances (in Russian); and the Emperor could not, if he would, thus flagrantly infringe custom and etiquette. Moreover, the Grand Duke Vladimir would not have been ascending that particular staircase (in the part of the palace known as the Old Hermitage), which does not lead to any imperial apartments, to attend a dinner which takes place in a very different part of the vast Winter Palace; he would have used the elevator, probably (which Mr. Newton seems to have missed), and the Emperor would not wait for him on the second landing, which commands a fine view, through glass, into the private imperial riding school.

The author's sweeping pronouncement on the "conventional faith in the Christian religion of the Russian upper classes," on p. 55, is curious when compared with his amusing laudation of "the Christian gentleness" of Gen. Kireef, "who seemed to realize the apostle's description of Cornelius the Centurion as one who was just and devout, and who served God with all his house," and with his parting shot, on p. 198, at "such a God-forsaken, darkened country as Russia," which our author had weighed in the balance and found utterly wanting in the space of a week! Even more curious is the result of comparing passages on pp. 115, 116, and 181. On p. 115 Mr. Newton says: "But there is one element in Tolstoi's genius from which, more than any other, it derives its most peculiar and characteristic tone; and this is his profound capacity for introspection, and his habit of exercising it constantly upon himself and in the study of other minds when he finds occasion for it. In regard to himself, the impulse of self-study, self-judgment, self-revelation seems to have been irresistible." On p. 116 he adds: "In his later novels, the conflicting moods and opinions which are agitating his own mind, are divided among appropriate characters; three at least being thus inspired in one work, 'War and Peace.' But invariably, however introduced, what he sees in his inmost self is reflected with realistic vividness. His very latest works are avowedly autobiographical." On p. 181 he says: "The inveterate vice of Lermontof, as of Pushkin, is the persistence with which he fixes his gaze upon himself, and everlastingly describes himself and his own feelings in his works. . . . A spirit so subjective was incapable of holding the mirror up to nature and revealing the temper of his countrymen and the condition of the land and time in which he lived."

The part of the book from which the last quotation is taken, that devoted to "Russian National Literature," has nothing whatever to do with either title or sub title, and it would have been better to omit it, especially as the greater part of it, as of the rest of the book, could not, necessarily, have been got at first hand, and as carelessness in compilation and copying deprives it of whatever value it might otherwise have possessed as a handy reference for those who are not already provided with one of the numerous good text-books or compendiums of Russian literature. It is marred by such positive assertions as the following: "The very list of the names of the writers and court poets under Catherine II. is tedious and dull, like an interminable procession of black hearses with empty coffins in them"—after which he gives the names of the absent corpses. Had he ever read Von Vizin's comedies, or seen the latter's play, "The Hobbledehoy," which holds the stage to this day, he might have omitted the name of that very lively corpse. "Rusland and Sindmila" instead of Ruslan and Ludmila, "Ouyegin" for Onyegin, "Herzin" for Herzen, "Tchrunishevski" for Tchernishevski, are instances of the carelessness displayed in this section.

The book is illustrated with the stock pictures of Count Tolstoi, the fortress, the Winter Palace, and so forth, more badly reproduced than usual, and including one of the Emperor and his family which is particularly unfortunate in that it represents the now bearded Tzesarevitch and his eldest sister, of the respective ages of twenty six and nineteen, as a smooth-faced lad of twenty and a little girl of thirteen years of age. We must also take exception to the heavy jocosity of the style, and the seasoning of frivolously introduced forced quotations from Scripture and allusions to Scripture, at all possible and impossible points, as being undignified and in questionable taste.

---

*The Silva of North America.* By Charles S. Sargent. Vol. VI. Boston: Houghton, Mifflin & Co. 1894.

THIS volume finishes the account of the trees of the Gamopetaleæ, and commences that of the Apetaleæ. Thirty-three trees are illustrated, of which thirteen are species of the genus *Fraxinus*, or ash. This name "ash" has been used in the vernacular for trees of very dissimilar nature; for while the trees known as white-ash, black-ash, blue-ash, and red ash are true species of *Fraxinus*, the poison-ash is a *Rhus*, and the tree commonly called mountain-ash is a *Pyrus*. This popular misuse of the name has undoubtedly arisen from a similarity in the foliage of the trees, for all of them, with the exception of the one-leaved ash of southern Colorado, have pinnate leaves, with several leaflets along each side of the common midrib. The genus *Fraxinus* belongs to the natural order *Oleaceæ*, the type of which is the classic olive (*Olea Europæa*). This order also includes the jasmine, the lilacs, the Virginian fringe-tree, and the prim or privet, so largely used for hedges. Among our native ash trees the white-ash (*Fraxinus Americana*) is easily the chief, being sometimes considerably over a hundred feet high, and with a trunk sometimes five or six feet in diameter near the ground. The trunk is, however, usually much slenderer, especially where the trees grow in dense forests. When Henry Clay was a candidate for the Presidency, it was common for his followers to set up a white-ash liberty-pole, probably in honor of Ashland, the home of the great Kentuckian. The red-ash (*Fraxinus Pennsylvanica*) furnishes a wood inferior in quality to the white-ash, but often substituted for it. The black-ash (*F. nigra*) has wood which is readily separable into layers, and is therefore largely used for cheap basket-work. There is a traditional belief that poisonous serpents have a wholesome fear of white-ash twigs and leaves, and that to stuff the leaves in one's shoes, or to carry a branch of the tree, "will keep off snakes." It might be interesting to inquire whether this notion is in any way connected with the Scandinavian ash-tree Ygdrasyl and the adder Nithhöggr, which was for ever gnawing at its root.

The Virginian fringe-tree (*Chionanthus Virginicus*) is well known as an ornamental shrub in our gardens; in the Southern States it sometimes becomes a tree twenty-five or thirty feet high. The devil-wood (*Osmanthus Americanus*) inhabits the coast region of the Southern States, where its polished, laurel-like foliage and its clusters of fragrant white flowers render it a very showy tree. The berries are dark blue when ripe, and nearly as large as a small olive, but apparently inedible.

The Virginian persimmon (*Diospyros Virginiana*) and the Texan persimmon (*D. Texana*) are our representatives of the *Ebenaceæ*, or ebony family. The black ebony of commerce is the heart-wood of several species of this genus *Diospyros*, natives of the Mauritius and East Indies. Prof. Sargent states that the heart-wood of the Virginian persimmon is dark brown or nearly black, but that it is seldom seen, as it is not formed until the tree is over a hundred years old. This tree ranges from Florida and Texas to Long Island, and a few straggling shrubs along the Connecticut shore give it a claim to be even a native of New England. In cultivation it fruits freely in southern Connecticut. The yellowish fruits are rather more than an inch in diameter, and contain several large seeds. Scarcely anything called fruit is more austere than an unripe persimmon; but when they have been frozen, or, in the extreme South, allowed to hang long on the tree, persimmons are sweet and luscious, and have a taste peculiar but by no means unpleasant. Now and then an individual tree has especially good fruit, and Prof. Sargent well remarks that by careful selection and cultivation the fruit might in time be made to equal the best Chinese and Japanese varieties in size and flavor.

The sweet-leaf or horse-sugar (*Symplocos tinctoria*) is a small tree of the Southern States, having somewhat laurel-like foliage and close axillary clusters of little sweet-scented yellowish or creamy flowers. The leaves are sweet to the taste and are eagerly devoured by domestic cattle. When dry, they are bright greenish-yellow in color, and, with the bark, are used in domestic dyeing. The silver-bell trees, heretofore known as *Halesia tetraptera* and *Halesia diptera*, but now masquerading under other names imposed through peculiar notions of what is proper in nomenclature, are graceful shrubs, or sometimes trees, with white, bell-shaped blossoms hanging from the branchlets on slender pedicels. They are beautiful in nature and in cultivation, but seem to have no use in the practical arts.

The natural order *Boragineæ*, represented in our gardens by the heliotrope and the forget-me-not, contains within its limits a good many tropical trees, and in Florida or Texas there are several trees of this order. *Cordia Sebestena*, of Florida and the Antilles, has clusters of large, flame-colored blossoms followed by ivory-white fruits the size of a large acorn. It is cultivated at Key West, and may have escaped from gardens and become naturalized in southern Florida. *Cordia Boissieri* is a somewhat similar Mexican tree, the flowers larger and white, which is occasionally found in Texas and New Mexico. The other trees of this family described by Prof. Sargent are the strong-back (*Bourreria Havanensis*), a West

Indian tree which occurs on the Florida Keys, and the Mexican Anaqua (*Ehretia elliptica*), which occurs native in Texas, and is often planted in the streets as a shade-tree on account of its dark-green foliage and its abundant clusters of white flowers. The two species of *Catalpa* come next, both probably natives of the Mississippi Valley, and both well known and often planted for shade or ornament. *Catalpa bignonioides*, here called *Catalpa catalpa*, in obedience to the ill-advised rules of the system of nomenclature adopted for this work, has less acuminately pointed leaves and less profusely spotted flowers than the other species (*Catalpa speciosa*). Both were formerly confounded under the old name of *Catalpa bignonioides*, and were separated in 1880 by Dr. Engelmann. The other trees of this family (*Bignoniaceæ*) are the Mexican *Chilopsis linearis*, which occurs from Texas to southern California, and the West Indian black-calabash (*Crescentia cucurbitina*), which is found on the continent only along the shores of Biscayne Bay in Florida.

Of the remaining five trees of this volume it need only be noted that one has both its English name, fiddle-wood, and its scientific name, *Citharexylum*, alike founded on a mistranslation of the old French name, *bois fidèle*, which was given to it on account of the great strength and toughness of its wood; and that another tree, the sea-grape (*Coccolobis uvifera*), growing along the Florida sea-coast, has bunches of nearly inedible grape-like berries and large, round, leathery leaves. A good use of this plant, not mentioned in the 'Silva,' is to place its branches on a camp-fire to drive away mosquitoes, which are usually very abundant wherever the sea-grape is found. The next volume of this splendid work will probably begin with the *Lauraceæ*, including red-bay and sassafras, and will include our native species of elm, mulberry, walnut, and hickory.

---

*The Life and Letters of James Macpherson*, containing a particular account of his famous quarrel with Dr. Johnson and a sketch of the origin and influence of the Ossianic Poems. By Bailey Saunders. London: Swan Sonnenschein & Co.; New York: Macmillan. 1894.

A THOROUGHLY scientific treatise on the Ossianic legends of Ireland and of the Highlands has long been a desideratum. Such a treatise would have much to say about James Macpherson and his English Ossian, no doubt, but, contrary to the general opinion, Macpherson's gaudy prose-poems would not be the centre of the discussion. Nor would there be much occasion for argument as to Macpherson's "originals" or the processes which brought his Ossian into its actual shape. No serious student of seventeenth-century literature any longer subscribes to Dr. Johnson's rough-and-ready verdict of out-and-out forgery, to say nothing of his brutal hypothesis of a fraudulent combination among all Scotsmen to shield a known fabricator. The celebrated Report of the Highland Society, published in 1805, after an investigation conducted with great fairness, showed that Macpherson really collected a good quantity of Gaelic poetry—some of which he but imperfectly understood—and that this furnished the groundwork not only for the 'Fragments' but for the formidable epics of 'Fingal' and 'Temora.' The same report makes equally clear the paraphrastic nature of Macpherson's translations, and the fact that he added, omitted, and combined with the greatest freedom. Though the utterances of Macpherson at various times in the long course of contemporary controversy were not always perfectly consistent, it should never be forgotten that he did not pretend that the two epics were discovered in the form in which he gave them to the world, but, on the contrary, represented himself as having pieced them together from many fragments.

All these facts, we repeat, have long been known, and would not have to be proved and could not be much disputed by any scholar who might undertake to supply the desideratum that we have mentioned. That scholar would have a far more difficult job on his hands than the assignment of Macpherson to his place in the limbo of dead authors. He would have to settle, if possible, the dates of the various pieces of Ossianic verse that are indisputably genuine, in the sense that they have been taken down from the lips of Highland reciters; he would have to determine the relations of the Highland Ossianic cycle to the Ossianic cycle in Ireland; and, finally, he would have to fix the positions of Finn and Ossian in the whole body of Celtic myth and legend. We need not say that, in discussing this last question, he would find himself involved in one of the most difficult problems of modern scholarship, and would have to reckon with those paradoxical theories with which Prof. Zimmer has for several years been surprising the learned world, and which he has advocated with an abundance of learning that may well be the despair of most of his opponents.

Mr. Bailey Saunders has no such purpose. He is not a Celtic savant, so far as we know, and he makes no pretensions to knowledge that he does not possess. He has apparently not informed himself as to the larger questions which surround the Macpherson domain. Zimmer he does not mention, nor has he much considered the possibility that the Ossianic story, even if its kernel is of considerable antiquity, may have been contaminated with all sorts of foreign material long before the last century. We do not say this by way of reproach, but merely by way of defining the radius of our author's researches. Zimmer's scattered and vagarious articles are hard reading and probably never met Mr. Saunders's eye. Certainly the latter may be forgiven for not having discovered the few lines of fine print which Zimmer devotes to Macpherson in a chance footnote, much as those lines would have interested him.

To most persons Macpherson is a forger who inoculated the last century with a variety of literary madness from which Byron suffered slightly in his youth. Mr. Saunders, coming to see the inexactness of this view, had the rather happy thought of writing Macpherson's life in a form not too elaborate to be read. The result is a decidedly interesting book. Of "Ossian" the author says little or nothing that is absolutely new. He puts into readable shape the results of the Highland Society's report, and to some extent the substance of other works which, though accessible enough, are never consulted by the general reader, and seldom, we fear, by students of our literature. This is a real service to letters; for, however dead 'Fingal' and 'Temora' may be, there is no exaggerating their importance in the history of the Romantic movement in England and on the Continent. We must add that Mr. Saunders makes some sensible remarks on this point, and that, in general, he is commendably judicial both as critic and as biographer.

The first half of his book is as easy reading as one can desire. The last half, which extends from 1763 to Macpherson's death in 1796, is somewhat less entertaining, but is far from dull. It is well that Macpherson's career as provincial secretary and surveyor-general of Florida, as newspaper writer, pensioner, historian, political pamphleteer, as agent for the nabob of Arcot, as country gentleman, should be set forth, once for all, in moderate compass. It has a good deal of interest in itself and throws some light on the times. Mr. Saunders has been conscientiously concise. He has had access to some unpublished materials, and prints a few letters—not enough, we think, to justify the title 'Life and Letters,' but enough to satisfy any reasonable curiosity about Macpherson's epistolary abilities, which were no brilliant.

The book closes with a chapter on the course of the Ossianic controversy, in the limited sense, since 1795. In this chapter fortune plays Mr. Saunders a jade's trick. So far he has steered clear of the Eddas, but here, in the last paragraph but one, he must needs attempt to compare the history of these works with Macpherson's manipulation of Ossianic material. Evidently he knows nothing whatever about either Edda, so that this paragraph is elaborately absurd. We will not quote it, however, preferring to leave it to the lenient judgment of the reader when he has actually finished the book and is—as he will be—in good humor with the author.

---

*A Short History of the Crusades.* By J. I. Mombert, D.D. D. Appleton & Co.

DR. MOMBERT has restricted himself to a bare narrative of events, and these are often so disjointed and miscellaneous that his account cannot always be easily followed. The separate exploits of a multitude of leaders make up a register which lacks coherence. It is too much to expect us to jump from the affairs at Edessa in one paragraph to those of Ptolemais in the next, and so on to Antioch or Tripolis or Jaffa. Doubtless the difficulty of blending the separate rills of story is great, but only by successfully blending could the best result be reached. We should have liked to have a better picture of the conflicting civilizations of Christendom and Islam from the eleventh through the thirteenth centuries; to have been told more clearly why it was, for instance, that the Christians of 1260 could not be roused to rescue the Holy Sepulchre as their grandfathers had been, or why the Crusaders appeared to the Saracens as a semi-barbarous people—in a word, we could have wished the underlying causes and spiritual forces described with more fulness and the details of battles cut down. For, after all, when you know that two hosts are at war, you gain little by reading reiterated statements of battles. What does it matter whether the King of France or the Duke of Austria charged the enemy's right wing at a given moment, if that particular fight was very much like twenty others? We do not mean to say that alert readers will not be able to get from Dr. Mombert a good deal besides martial descriptions, but we do mean that these too much obscure deeper considerations of cause and effect.

One point which any writer upon the Crusades might well devote attention to is the statistics of the forces engaged. If we are to believe the old chroniclers, armies of 200,000 or 300,000 men were raised with astonishing despatch by either contestant; it was no rare thing for 50,000 men to be slain in battle or to die of pestilence. But whoever has been in Palestine knows that, to-day at least, such multitudes could not be supported there a

week; how, then, were they supported for months and years during the Crusades? Whence came the provisions and water? Or, as seems more likely, are the numbers of combatants and camp-followers enormously exaggerated? For all that one can see, 200,000 or 300,000 soldiers, suddenly set down on Cape Cod, would have as fair a chance of subsistence as the Crusaders had in the neighborhood of Jerusalem. If an historian, therefore, has not the data to correct the figures, he ought at least to explain how so vast a force could be fed. We may be sure that mediæval cities and rural districts did not live less from hand-to-mouth than our own do, and we ought to be told where the enormous surplus stores came from.

Gibbon, it will be remembered, declared that the Crusades "checked rather than forwarded the maturity of Europe." The majority of subsequent historians, on the contrary, have asserted that they helped to advance the civilization of Europe. The question, to our thinking, is very difficult, and of more interest than any narrative of the exploits of the Crusaders themselves. We could wish, therefore, that Dr. Mombert had given to it more than a few superficial paragraphs at the end of his book. How far did the intercourse of Christian and Mussulman benefit each? What influence had the Crusades on chivalry and the European ideal of honor? How far did the filtration of classic learning through Arabic writers hasten the Renaissance? Was the culmination of the Papacy in the reign of Innocent III. a result of the Holy Wars? Was the tendency towards the absorption of small fiefs in great fiefs, and towards the formation of national governments along dynastic lines, accelerated by them? Were they indispensable to the expansion of commerce? How did the Christian Crusades differ from the Mohammedan religious wars four hundred years earlier? These are matters which call for philosophic treatment, and which cannot properly be ignored in any history of the Crusades, if the Crusaders are to be lifted in the records of the human race above the significance of gigantic bands of Coxeyite vagabonds.

BOOKS OF THE WEEK.

Alger, Horatio, Jr. Only an Irish Boy. Philadelphia: Porter & Coates.
Bird, Charles. Geology: A Manual for Students in Advanced Classes. Longmans, Green & Co. $2.25.
Carwardine, Rev. W. H. The Pullman Strike. Chicago: C. H. Kerr & Co.
Drage, Geoffrey. The Unemployed. Macmillan. $1.50.
Elmslie, Theodore C. The Little Lady of Lavender. Philadelphia: American Sunday-School Union. $1.25.
Filon, Augustin. Renégat, 1586-1593. [Bibliothèque de Romans Historiques.] Paris: Armand Colin & Cie.
Grimm's Fairy Tales. [The Chandos Classics.] F. Warne & Co. $1.
Hardy, E. G. Christianity and the Roman Government: A Study in Imperial Administration. Longmans, Green & Co. $1.50.

# NEW MODERN LANGUAGE TEXT-BOOKS.

*ENGLISH.*

**Brink's** (B. ten) **English Literature.** Vol. II. Translated from the German by W. CLARKE ROBINSON. 399 pp. Teachers' price, $1.60; postage, 13 cents.

**Pancoast's** (H. S.) **Representative** ENGLISH LITERATURE. Selections with Historical Connections. 517 pp. Teachers' price $1.60; postage, 15 cents.

**Lounsbury's** (T. R.) **History of the** ENGLISH LANGUAGE. Rewritten and augmented. 505 pp. Teachers' price, $1.12; postage, 12 cents.

**Bright's** (J. W.) **Anglo-Saxon Read-**ER. New edition, with grammatical outline.

**Baker's** (G. P.) **Specimens of Ar-**GUMENTATION. Modern. (*Readings for Students.*) 186 pp. Teachers' price, 50 cents; postage, 4 cents.

**McLaughlin's** (E. T.) **Marlowe's** EDWARD SECOND. (*Readings for Students.*) 180 pp. Teachers' price, 70 cents; postage, 5 cents.

**Hart's** (J. M.) **DeQuincey's English** MAIL COACH AND JOAN OF ARC. (*Readings for Students.*) 138 pp. Teachers' price, 30 cents; postage, 4 cents.

**Beers' Prose Extracts from Cole-**RIDGE. (*Readings for Students.*) 146 pp. Teachers' price, 30 cents; postage, 4 cents.

**Shaw's** (E. R.) **English Compo-**SITION BY PRACTICE. 203 pp. Teachers' price, 75 cents; postage, 8 cents.

*GERMAN.*

**Thomas's** (C.) **Practical German** GRAMMAR. For schools and colleges. Advance sheets (175 pp.) in boards, exchangeable for complete book when issued. Net provisional price, 60 cents; postage, 5 cents.

**Carruth's** (W. H.) **Schiller's Wal-**LENSTEIN. Complete. 515 pp. Teachers' price, $1.00; postage, 9 cents.

**Joynes's** (E. S.) **Schiller's Maria** STUART. Entirely new edition. Teacher's price, 60 cents; postage, 6 cents.

**Nichols's** (A. B.) **Freytag's Karl** DER GROSSE, etc. 218 pp. Teachers' price, 75 cents; postage, 5 cents.

**Brusie's** (C. F.) **Heyse's Das Mad-**CHEN VON TREPPI; MARION. 102 pp. Teachers' price, 25 cents; postage, 3 cents.

**Palmer's** (A. H.) **Riehl's Burg** NEIDEELE. 76 pp. Teachers' price, 30 cents; postage, 4 cents.

**Fischer's** (A. A.) **Progressive Ger-**MAN READER. Prepared for Natural Method Instruction. 126 pp. Teachers' price, 70 cents; postage, 6 cents.

*FRENCH.*

**Joynes's** (E. S.) **Minimum French** GRAMMAR AND READER. 269 pp. Teachers' price, 75 cents; postage, 6 cents.

**Bronson's** (T. B.) **Exercises in** EVERY-DAY FRENCH ELEMENTARY COMPOSITION. 92 pp. Teachers' price, 60 cents; postage, 4 cents.

**Warren's** (F. M.) **Selections from** VICTOR HUGO. 244 pp. Teachers' price, 70 cents; postage, 6 cents.

**Fortier's** (A.) **Histoire de la Lit-**TERATURE FRANÇAISE. 362 pp. Teachers' price, $1.00; postage, 8 cents.

**Cameron's** (A. G.) **Contes de Dau-**DET. (Includes *La Belle Nivernaise*, which is also published separately.) 321 pp. Teachers' price, 80 cents; postage, 7 cents.

**Cameron's** (A. G.) **Merimee's Co-**LOMBA. 240 pp. Teachers' price, 60 cents; postage, 6 cents.

**Edgren's** (A. H.) **Thiers' Bonaparte** EN EGYPTE. 130 pp. Teachers' price, 35 cents; postage, 3 cents.

**Sanderson's** (R. L.) **Chateaubriand's** AVENTURES DU DERNIER ABENCERAGE, etc. 112 pp. Teachers' price, 35 cents; postage, 3 cents.

**Lewis's** (E. G.) **Verne's Michel** STROGOFF. 222 pp. Teachers' price, 70 cents; postage, 6 cents.

**Bishop's** (W. H.) **Choy-Suzanne.** 64 pp. Teachers' price, 30 cents; postage, 3 cents.

**Harper's** (G. H.) **Hugo's Hernani.** 176 pp. Teachers' price, 70 cents; postage, 6 cents.

*SPANISH.*

**Ramsey's** (M. M.) **Text-Book of** MODERN SPANISH. 653 pp. Teachers' price, $1.80; postage, 16 cents.

HENRY HOLT & COMPANY, NEW YORK.

# YALE MIXTURE.

The choicest tobacco made, and pre-eminently a gentleman's smoke.

**Marburg Bros., The American Tobacco Co., Successor, Baltimore, Md.**

# *A Tonic*

*For Brain-Workers, the Weak and Debilitated.*

**Horsford's Acid Phosphate** is without exception the Best Remedy for relieving Mental and Nervous Exhaustion; and where the system has become debilitated by disease it acts as a general tonic and vitalizer, affording sustenance to both brain and body.

**Dr. E. Cornell Esten,** Philadelphia, Pa., says: "I have met with the greatest and most satisfactory results in dyspepsia and general derangement of the cerebral and nervous systems, causing debility and exhaustion."

Descriptive Pamphlet free.

*Rumford Chemical Works, Providence, R. I.*

Beware of Substitutes and Imitations.

Brentano's announce for publication during September a catalogue of books on the **Study and Acquirement of the Modern Languages.**

The work is conveniently arranged, and comprises an unusually complete list of titles of the best accepted books devoted to the subject mentioned.

It is of real practical value to teachers, students, and the public. It will be sent upon application free.

BRENTANO'S,
31 Union Square, N. Y.

# The Nation.

NEW YORK, THURSDAY, AUGUST 30, 1894.

## The Week.

On Tuesday began a new era in the industrial history of the United States, when the first step for more than a generation was taken in the direction of the emancipation of commerce from the shackles of mediæval exclusiveness and the fallacies of the mercantile system. For many reasons this step has been far more difficult to take than any subsequent one will be. Arrayed against its policy there have been the solid ranks of the Republican party, while the protectionist element among the Democrats has, with only too much success, resisted reform and limited the reduction of duties. Nevertheless, a measure of reform has been adopted, and the attitude of the country has been thereby changed. Henceforth we face, not toward increasing corruption in political campaigns and in the halls of Congress, but towards greater purity. We are turning away from an atmosphere foul with open lobbying and secret bribery to one in which the purchase of favorable legislation will cease to be a principal element, not only because it will not be practicable, but also because it will no longer be thought desirable. After the first plunge, the new medium of freer trade will be found by great numbers of people to be not only less terrible than they supposed, but even positively beneficial; and this will be peculiarly the case with many of the manufacturers.

---

The decision of the Treasury Department to allow withdrawal from bond without payment of duty, in the case of all goods put on the free list, is certainly good sense and presumably good law. It is, moreover, but a small number of articles that will be affected by the decision — pig tin and wool being the chief. The statement is given out that if anybody feels "aggrieved" at the secretary's interpretation of the law, he can test the matter in the courts. But it is hard to imagine who could feel aggrieved. The importers will not consider it a hardship to be let off paying thousands of dollars in duties, nor will the manufacturers rebel at getting their raw material cheaper, or the consumers at obtaining the finished product at a lower figure. The tin-miners have too many suits for fraud to defend just now to care about resisting the free entry of tin to compete with their mythical product. We should think it possible that the Political Shepherds would have grievous sensations at seeing wool come in duty free, but it is doubtful if they will stop over so small a matter as this Treasury decision. They have the far grander work on their hands of fulfilling their old threat to make the manufacturing towns of New England howling wastes.

---

That wool-laden bark, cruising off Boston harbor until the new tariff came into effect, ought to be significant of much to our protectionist brethren. The dreadful avalanche of foreign free wool is already upon us, and yet the price of domestic wool is advancing and the woollen mills are preparing for a great rush of business. What has McKinley to say to this? Does he mean, as he says, promptly to restore protection to wool and woollen manufactures, and stop all this hideous prosperity? If something is not speedily done, we shall actually be exporting shiploads of carpets, and how could Messrs. Lawrence and Delano survive that? Ah, but the Bradford manufacturers are smiling as they think how they will soon be swamping us with their goods. But the *Wool and Cotton Reporter* declares that there is nothing in this, and that American manufacturers have not been asleep all this time, but have been preparing to make goods as cheap and desirable as can be had anywhere. All they have lacked before is the wool to do it with, and now that they have got that they are ready to outsmile any Yorkshireman of them all.

---

The strike in the cotton mills at New Bedford and Fall River has been very gingerly handled by the high-protection press. Here, apparently, was a splendid chance to show how the new tariff was already operating, and to ask the workingmen how they like it. But, to the surprise, doubtless, of their long-suffering readers, there has been an almost dead silence about this "object-lesson." This is doubtless because they clearly remember what the cotton schedule of the new tariff is, and how it came to be adopted. Reference to the *Congressional Record* of June 12 will show what it is that is now muzzling them. On June 11 Senator Jones brought in a completely recast cotton schedule. One amendment after another was offered and was put through without debate or opposition, until at last Senator Dolph, who was not in the secret, jumped up in amazement to know what it all meant. This was the biggest surprise of the session, he affirmed. "Here is one of the most important schedules in the bill, which covers ten pages of closely printed matter, and it has been substantially disposed of in thirty minutes." Where was the vigilant and aggressive Aldrich? Why was Senator Hoar so suddenly, if refreshingly, silent?

---

Thus called upon, Senator Aldrich had to take the floor, and proceeded to chain up all the protectionist dogs in this fashion: "This schedule," he said, "which *was prepared by a number of manufacturers of Fall River* so far as the price of cloth is concerned, is perhaps the *most scientific schedule* that has ever been prepared upon the subject." He went on to say that "the committee deserves the thanks of the cotton-manufacturers of the country." Of course he had to add that he did not think the duties as high as they should be, but he made no opposition to the schedule, to which he had given such a handsome certificate of character. Senator Hoar explained that "we all agreed, I and the Senator from Rhode Island, that the schedule, as proposed, should pass without opposition." Of course, as to the "general wickedness of the bill," the Massachusetts Senator remained of the same opinion, but the Jones amendment to the cotton schedule he agreed with the manufacturers in finding "perfectly satisfactory."

---

It did not need a despatch from Madrid to inform us that the duty on sugar in the new tariff would make an end of the Cuban reciprocity agreement. Free sugar was the *quid* which we gave for the Cuban *quo*, and the withdrawal of the former necessitates that of the latter. The language of the bill is that "nothing herein contained shall be held to abrogate or in any way affect such reciprocal commercial arrangements as have been heretofore made and now exist between the United States and foreign countries, except where such arrangements are inconsistent with the provisions of this act." This is very much like the protestations of the Quaker that he was a man of peace, but that if there was a burglar in the corner where he was going to shoot, somebody might get hurt. Neither the Cubans nor the Brazilians would ever have made their agreements but for the promise of free sugar; and however suavely we may now say that we should like the thing to go on, so far as their concessions to us are concerned, just as before, it is not likely that they will be amiable or green enough to see it in that light. The main consideration in all the reciprocity treaties is effectively destroyed by "the provisions of this act," so that its careful denial of intent to abrogate them is only a piece of humor. On the other hand, the Hawaiian treaty, which was a real and not a sham treaty, is ex-

pressly continued in force until abrogated in the regular way.

---

The California Republicans this year adopted one of the longest platforms on record, and the telegraphed abstract mentioned only a few of its planks. One resolution, not given in the despatches, begins by "heartily endorsing the proposition that the farmer of the nation, by whose labors the agricultural products of the country are brought to market, should receive a just measure of protection for himself, his labor and his products." It points out that the price of these products is regulated by the amount paid for them in the world's market centres, less the cost of transportation from the place of production, and that, "owing to the great development of staple agricultural products in many of the cheapest labor countries of the world, the prices realized by our farmers have of late been unremunerative." Then comes the practical proposition

"It is our duty to endeavor to change this state of affairs. Hence we approve of the plan that the Government of the United States should reduce the cost of transporting these staple agricultural products from American seaports to foreign seaports, to the end that the prices of these products should be advanced; and for that purpose, inasmuch as an export can be protected in no other manner, we pronounce ourselves in favor of the use of a limited portion of the receipts of the United States customs for such purposes, and pledge our most earnest efforts to have this measure engrafted upon the laws of the land, to the end that the American protective system shall benefit all classes of the people, aid the farmer against the oppressive competition of the cheap-labor countries of the world, and by so doing assist in maintaining that steady demand for labor in manufacturing centres so essential to the labor of our country."

---

Here we have the latest development of protection. The Government must overcome the natural laws of trade in the interest of one class—those farmers who raise certain crops; just as it has overcome the same laws in the interest of another class—those manufacturers who make certain kinds of goods. In order that the men who raise wheat, cotton, and corn may get more money for their crops, all of the people are to be taxed for their benefit, and the prices of these staples are to be marked up for all in this country who consume them. The rest of us are to be made by law to pay more than we should otherwise do to the raisers of wheat, cotton, and corn, and all hands will then be prosperous.

---

The first Republican "keynote" for the future was struck by ex-Speaker Reed at Old Orchard, Maine, on Saturday. Democratic incompetency and depravity are set forth with Mr. Reed's familiar verbosity; but when the portions of his speech devoted to this subject are eliminated, very little remains. About twenty lines contain all that he has to say of the future tariff policy of his party, and these amount simply to a declaration that there is nothing for the good and wise Republicans to do except to stand on guard and prevent the depraved and incompetent Democrats from doing any more mischief. He admits, as the *Tribune* does, that there can be no more tariff legislation till President Cleveland's term expires; but he is not prepared to say that more high tariff will be in order then. He merely says that time is needed in which to permit the country to examine the workings of the new law, "to see precisely what its defects are, and then accomplish whatever remedy is needful to bring the country back to the state of prosperity which it was in when this unfortunate black cloud of Democratic control passed over it." He wishes it to be distinctly understood that the bill is not a finality, and he is braced, like all other good Republicans, to resist the coming of a wave of permanent prosperity.

---

The Constitutional Convention is gradually fastening one bad provision after another upon the fundamental law which the members are trying to make. Each one of these insures a certain number of negative votes against the whole instrument, and it is apparently only a question of time when their work will be completely waterlogged. The section about prison labor has been cunningly devised so as to prevent the State from selling (except to itself) any articles made in the prisons, while seeming only to prevent contract labor. By injecting the word "product" among the prohibited things, the prison section not only prevents the hiring out of the convicts, but prohibits also the selling of anything they make except to State institutions. They may make clothing for the inmates of the various public asylums, but if they make anything not needed by the State itself it must remain in the prisons till it decays. It is needless to say that this is not a fit subject for a State constitution to attempt to regulate. The General Assembly is always competent to deal with the subject, and ought always to be privileged to do so, more especially since it is compelled to make appropriations for the support of the prisons. The questions of prison labor and prison support ought always to go together. This is just what the labor demagogues want to avoid. They want to have the whole question disposed of for an indefinite period by a body which is under no necessity of providing for the expense of the prisons, and thus take a snap judgment on the people. Mr. Choate vainly endeavored to prevent this outrage—this attempt of a comparatively small number of persons to increase the taxes of all the people, and chiefly of the farmers and other landowners. We venture the prediction that this clause, if finally adopted, will lose more votes for the whole instrument than it will gain.

There could scarcely be a stronger example of the misuse of a constitution than is found in the amendment proposed by the judiciary committee at Albany on the 21st in regard to the corrupt use of money in elections. The amendment simply amounts to a direction to the Legislature to pass general laws forbidding the improper use of money in elections, and also prohibiting corporations from making any contributions to election expenses. We have on the statute books now a great mass of prohibitory legislation of this sort, nearly all of which is impotent because no provision is made for its enforcement. The Legislature has ample authority to make such laws, and needs no additional direction from the Constitution in that respect. What is needed is not more specific and stringent prohibitory laws, but provisions which will furnish the agency for the detection of violations of the laws and the machinery for enforcing the laws. The Legislature has refused repeatedly to give us anything of the kind. It has refused to supplement the prohibitory laws with provisions requiring the sworn publication, after election, by campaign committees and agents, of every dollar received or expended. That is the only way in which the contributions of corporations and individuals could be forced into the light and the use made of them set forth for public contemplation. It is futile to prohibit contributions by corporations, unless we at the same time make it impossible for such contributions to be made without detection. Prohibitory clauses in the Constitution would be of no more use than prohibitory laws on the statute-book; and they would be, furthermore, completely out of place there. The corrupt use of money in elections can be prevented when public sentiment becomes strong enough, first, to compel the passage of laws making such use impossible without exposure, and, second, to compel the rigid enforcement of those laws.

---

The address of Judge Cooley, as president of the American Bar Association, is full of interest to the laity as well as to the legal profession. He reviews the principal social events of the year, the movement of armies of vagrants upon Washington and the disturbances at Chicago, in such a way as to bring out the significance of the episodes with admirable clearness. Whoever desires to understand what was involved in these movements cannot do better than to read this address, which has been printed in full in the September issue of the *Forum*. As to the Chicago strike, Judge Cooley dismisses Gov. Altgeld's theory of constitutional law briefly. According to that theory, he says, it becomes the duty of the Governors of the States, and not the

President, to see that the federal laws are executed, whereas the Constitution specifically charges the President with this duty. If Gov. Altgeld were right, "the mails might be stopped at Chicago, interstate commerce broken up, and the process of the United States courts refused service, unless the Governor, when disorder was dominant, saw fit to suppress it, or call upon the President to do so." Another point, which Judge Cooley thinks has received no attention, concerns the rights of those to be affected by the strike. The parties were (1) the railroad companies, who, if they had been allowed to be heard, might have demonstrated to the strikers that their action was unreasonable; (2) the Government of the United States, whose postal service was to be interrupted; (3) the people, whose right of transportation was to be suspended. The action of the strikers involved the substitution of arbitrary and despotic power for representative government in ignoring the claims of all these parties.

---

An idea has got abroad that the Pullman Car Company as a manufacturing concern is "affected with a public interest," so that if the Pullman Car Company makes a dividend of 8 per cent. per annum from the earnings of its sleeping-cars, it ought to pay higher wages to the workmen in its car-building shops than other workmen receive in other car-building shops. Still another popular fallacy is that if the Pullman Company owns and lets houses to its workmen, the rents ought to be reduced whenever the wages are reduced. It is an easy inference from the latter proposition (and Gov Altgeld was prompt to draw it) that if a strike occurs for any reason, the collection of rent ought to cease until the occupants of the houses resume work. All these queer notions took their start in the idea promulgated by Debs that it was incumbent on the Pullman Company to submit to arbitration the question whether it should raise wages to the scale of 1893 or not.

---

In the course of the examination of witnesses at Chicago on Monday, Mr. Pullman took occasion to deny flatly all of these propositions. Instead of palliating and apologizing and extenuating, he "took the bull by the horns." If he had not done so, the other side would either have pushed him over the precipice completely, or would have turned the whole controversy into a question of details—as, for instance, whether the rents of the houses were fair or not, whether the company could have paid higher wages than it did pay, or whether it would have been safe to draw from its reserve fund in order to build cars at less than cost. Argument upon these points would have been endless, and would have furnished a year's supply of ammunition to Altgeld. Mr. Pullman took safe ground, and the only safe ground, when he smote all these anarchistic conceptions in the face as fast as they came up. Of course he will be subjected to a great deal of ignorant as well as malicious criticism, because a great many well meaning people can see only one thing at a time. They can see a great rich company on the one hand paying 8 per cent. dividends, and on the other a large number of men with families out of work, and suffering perhaps for the necessaries of life. What they do not see is the fact that the Pullman Company must, in the long run, build cars at a profit (or at least without loss), or eventually go down with its employees in one common ruin. The question how much loss it can safely incur in any given period must necessarily be left to the judgment of those who are charged with the responsibility for its affairs, and not to a mayor and board of aldermen or any popular assemblage.

---

The investigation of Prof. Ely's economic teachings by the regents of the University of Wisconsin is concluded. His accuser, Supt. Wells, practically refused to appear before the committee to support his charges, on the ground that the scope of the inquiry was unfairly limited. He submitted two statements, however, in one of which he admitted that he was not able to prove his charges of personal misconduct. Prof. Ely, on the other hand, explicitly denied that, as charged, he had ever entertained a walking delegate at his house, or had ever taken printing away from a firm because it was non-union, or had given countenance to the strike in Madison. Inasmuch as Supt. Wells's letter containing these grave charges was first published in our columns, we hasten to give Prof. Ely the benefit of his denial of them. These personal matters were wholly between him and Mr. Wells, and if he has been unjustly attacked, as now appears, no one will be better pleased than ourselves to see him vindicated. The nature and tendency of his economic teachings, upon which alone we have pronounced an opinion, are a proper subject for public discussion, upon which different men will hold different views. But we limit ourselves, for the present, to giving as much publicity to Prof. Ely's denials as we did to the charges against him. We may add that our columns would at any time have been open to him or any friend of his to make such denials.

---

The wickedness of the gold-bugs in pursuing Senator Stewart of Nevada has been often noticed in the press, but who could have imagined that they would send a complaining husband from North Carolina to bring a blackmailing lawsuit against him? This seems to show the depth of their degradation as well as the height of their malice. Such a suit has been brought, it seems, and the Senator, in trying to account for it, says to a *Herald* reporter:

> "There are some things behind this action other than the desire on the part of this man to get money from me. The gold-bugs would like very well to injure my character, and their representatives have conspired to help this man. I have scored some successes against the representatives of the gold interest, and they would like to injure me in any way that they can."

The Senator says that he has expended a great deal of money in hunting up the woman's character in Richmond and other places south of Washington. Why should he go there? That is the place to look for silver-bugs, not gold-bugs. Why did not the Senator spend part of his money investigating Wall Street if he really supposed that the gold-bugs were in this blackmailing conspiracy?

---

The probability that Russia will take an active part in the quarrel between China and Japan over Corea becomes increasingly strong as one studies her recent military movements and diplomacy in relation to the peninsula. Passing by the massing of her troops, who are also railway and fortification-builders, at Possiette and Vladivostok, we note her remarkable treaty with Corea, signed June 25, 1884. So far as we know, the text of this instrument has not been made public in any European language, but is found in a Japanese translation published last year in Tokio. The Russian is even more detailed than the English treaty, which (in the European view) was considered to be the best of all, and most favorable to the larger Power. Besides providing extra-territoriality for all Russians in Corea, it makes it possible for Russian war-ships to use freely the unopened as well as the open ports of the little kingdom. Although the benefits promised are mutual, yet, since Corea has no navy, and there is no likelihood of her ever availing herself of various stipulations, the text reads wonderfully like the conversations of a bear and a lamb. Although Herr Möllendorf was decorated by the Czar for his active part in the negotiation of this treaty, the Corean Government, whose hand was moved by Li Hung Chang of China, soon gave him *congé*. It is highly suggestive to read this treaty in the light of Russia's diplomacy and interpretation of treaties under Ignatieff in 1861. Then an area of territory as large as France was sliced from China and made a part of Russia, whose borders at once adjoined Corea, with a fordable river, only a few score yards wide, between. Between Gensan, the northern Corean port, and Possiette is less than a day's steaming. Between Russian town and Corean frontier is but twenty-five miles.

### THE NEW YORK JUDICIARY.

THERE are several respects in which the system of administering justice in this State might be improved, but apparently so little agreement exists as to either means or ends that the prospects of reform cannot be thought very bright. We presume that every one, whether lawyer or layman, would concur in holding that the Court of Appeals ought somehow to be enabled to decide cases as fast as they come to it, and not to fall into arrear with its business as it does at present. Beyond this there seems to be no consensus of opinion. Many lawyers say that the result should be attained by limiting the number of cases; but some hold that this should be accomplished by forbidding appeals where the pecuniary amount involved is small, while others exclaim against this proposal, upon the ground that a question of law is of the same importance in a matter of $5,000 as in one of $50,000.

It may be urged against this view that if two trials are allowed, as at present, in the case of actions involving less than $500, the chances of injustice are so small as to make the maxim, *De minimis non curat lex*, applicable. If there is an important and novel question of law involved, it will presumptively receive careful consideration, and when it eventually comes before the Court of Appeals in some case of magnitude, that court will seldom reverse decisions so rendered. But, whatever may be the merits of this argument, it is not regarded as conclusive by those who are opposed to limiting appeals by any money standard, and for this reason, we presume, the committee of the Constitutional Convention has not proposed to alter the present restriction. Nevertheless, when we come down to the gist of the matter, it is evident that in one way or another some of the cases that now go to the Court of Appeals must be kept from going there if that court is to be relieved.

It is true that relief might be obtained, in theory, by adding to the numbers of the appellate judges, and an increase to nine members was actually proposed by the committee. A mistake was made in introducing the "bipartisan" plan of election, so that nothing could defeat the nominees of the two parties; but this was at once observed, and no one appears to defend it. It is evident, however, that the legal profession does not favor an increase in the number of these judges, and it is stated that the present members of the Court of Appeals do not favor it. It is doubtful if a court of nine judges would be as efficient as one of a smaller number, and it is quite probable that its decisions would be less consistent. The court as at present constituted has certainly been a successful institution. Mr. Choate is a competent critic, and at a period when our governmental machinery receives so much unfavorable comment it is a pleasure to hear him declare that the New York Court of Appeals compares favorably with any similar court, State or national. He does not think that the court would do more work with nine than with seven judges, and so many of the profession agree with him that it is quite probable that the whole judiciary article would have been defeated by the people if the Convention had not rejected the provision for the increased number.

Dismissing this suggested remedy as inefficacious, there is nothing left but to reduce the number of appeals, and this the committee proposes to do by reconstituting the General Terms in such a way that their decisions shall be final in some cases where they are not so at present. In theory the Court of Appeals does not consider questions of fact. In practice the judges have always done so whenever they found it convenient, and have declined to do so when they did not. In certain cases they are obliged to review the facts, and any one reading the reports of their decisions will be struck with the full statements of fact that frequently occur in them. It is proposed now to make the practice correspond with the theory, by creating stronger intermediate courts to settle questions of fact finally before the Court of Appeals can be resorted to. The proposed amendment contains a clause specifically precluding review of a unanimous decision of the new intermediate court or so-called "Appellate Division of the Supreme Court," which holds that there is evidence to sustain a finding of fact or a verdict not directed by the court. This does not affect cases of non-suit, or verdicts directed, or reversals by the Appellate Division, or cases where there is a dissent in that court. But it does, as the report of the committee says, "require that when a trial court or jury has decided that a fact is proved, and five judges in the Appellate Division have unanimously held that it is proved, controversy about that fact shall end; and that any question of law mixed with that fact shall be separately raised and presented in order to be reviewed by the Court of Appeals."

There is much to be said in favor of the constitution of these intermediate courts in place of the useless General Terms, and it seems reasonable to expect that they will furnish the relief desired. We should have been glad to see some endeavor made to lower the excessive salaries, which are a premium upon corruption in offices where it is especially deplorable, and to have had the tenure of office extended; but it is idle to attempt too much reform at one time. What is to be dreaded is that the legal profession may not give its hearty support to the amendments proposed. Without such support the people will not be induced to vote for them.

### HOW THE REFERENDUM WOULD WORK.

A STRONG appeal has been made by a certain school of political writers in this country for the adoption of the referendum principle, and the submission of proposed laws to the people for their judgment. The advocates of the scheme have been active enough in Massachusetts to secure its endorsement in the platforms of both of the great parties, and the last Legislature came very near taking the necessary steps for submitting an amendment to the Constitution, so as to embody it in the fundamental law.

It is a noteworthy fact that, in all the arguments advanced in favor of the system, it seems to be taken for granted that, if any question were submitted to popular vote, every voter would express his opinion upon it. It has been urged that the State would be benefited by having important laws ratified by the people before they should become operative, and a great deal is said as to the advantages of finding out just how the people feel about them. Since the Massachusetts Legislature adjourned, however, the people of that State have been given an object-lesson in the working of the referendum. For years the city of Boston has been discussing the matter of rapid transit. It had become the burning local question. The newspapers have discussed it at great length. It has been repeatedly before the City Council and the Legislature. All sorts of schemes have been proposed from time to time. Finally, what is known as the Meigs plan was endorsed by the Legislature, upon the condition that it should be approved by the people. A special election was called for the sole purpose of deciding the question. There was an animated canvass, and, according to the theory of the referendum, there ought to have been a great outpouring of the people to improve the opportunity thus afforded to decide a most important issue. In point of fact, the total vote was much less than half the poll in the last election for Governor—not quite 30,000, against over 70,000 last November.

The 29,704 men who took the trouble to go to the polls were divided pretty evenly in opinion, 15,542 voting yes and 14,162 no. An important question of public policy was thus decided by the votes of less than a quarter of the men who turn out in an ordinary State election like last year's. Worse still, there is great reason to doubt whether a large proportion of those who voted either way had a clear understanding of the matter. The Boston *Herald* heard of two cases where the voters supposed that

they were recording their views on the license question, and voted yes because they favored the sale of liquor! When one paper accidentally learns of two such cases, there is every reason to suppose that hundreds of votes were cast quite as ignorantly.

There was nothing exceptional about this Boston experience. Two amendments to the Constitution were submitted to the people at the recent State election in Alabama. One proposed to allow the city of Birmingham to increase her tax-rate, which is necessary for her prosperity. The other proposed to allow any city or school district to vote a tax of one-fourth of one per cent. for educational purposes, to supplement the fund raised by State taxation. There was no serious opposition to either amendment, but both failed. They died of sheer neglect. The Constitution requires that a majority of the voters who go to the polls shall vote in the affirmative to carry an amendment, and most men were so much interested in the contest between Oates and Kolb that they did not vote either way on either of the amendments; the total yeas and nays not reaching half the total vote for Governor. The election thus failed to cast any light upon the question whether the proposed changes meet with the approbation of the people.

Almost every vote on a constitutional amendment in this State has been a proof of popular indifference. In 1869, on an amendment providing for equal assessment and taxation, 462,072 votes were cast (for and against), while for the head of the State ticket (Secretary of State) a total of 641,707 votes was cast. In 1876 the people voted on two of the most important constitutional amendments ever submitted to them—those placing the canals and State prisons under single heads instead of the expensive commissions. The total vote of the State for President that year was 1,015,502. The total vote on the public-works amendment was 614,985, and on the prisons amendment 611,184.

The same thing has happened over and over again in other States. It is the rule in many commonwealths that an amendment must receive the affirmative votes of a majority of the voters to carry it; and it is a common thing to have propositions fail to which there is no serious opposition, because those who really favor the suggested change do not care enough about it to take the trouble to express their opinion.

The advocates of the referendum have been arguing the matter as though it were only a question of theory. They say: "Consult the people freely. They will be glad to record their opinion, and we shall find out just what they think." This would be well enough if the matter had never been tried. But it has been tried, repeatedly and thoroughly, in different parts of the country. Experience has shown that it is the hardest thing in the world to get voters to express themselves on any issue except that of candidates for office. If other propositions are submitted at the regular election, most men who go to the polls will pay no attention to them. If they are submitted at a special election, the majority will not go to the polls; and a good many of those who do go will not know what they are voting for. In either case the referendum breaks down utterly.

The members of the Constitutional Convention did well on Friday to reject the proposed amendment permitting the Legislature to send bills to a public referendum.

---

*THE TRIALS OF THE STATISTICIAN.*

It was once said that the only good book which the Spaniards had was the one which exposed the absurdity of all the rest. We will not compare Mr. Carroll Wright's article upon "The Limitations and Difficulties of Statistics" in the current *Yale Review* with the Adventures of Don Quixote; but we are inclined to think that it exceeds in merit a great deal of the statistical work for which Mr. Wright has been nominally responsible. He will not regard this as an unjust aspersion, for, as he points out, the real responsibility for deceptive and misleading figures, or those at least that emanate from Government offices, belongs to the legislative bodies. These bodies are increasingly fond of ordering returns that can be furnished only after the most prolonged and elaborate investigation, and that frequently cannot be obtained at all. But what the ordinary Congressman desires is some sweeping generalization which he can use in the speech that he is preparing for delivery in a day or two, and which will answer his purpose, in many cases, equally well whether it is true or false. There is a story which, if not true, is at least well invented, of a clerk who responded to a demand of this character by saying: "Let me know what you want to prove, and I will furnish the necessary figures." Every one familiar with what passes with the public for statistics knows how easily this can be done.

As Mr. Wright observes, the science or art of statistics is nothing but classification. A certain number of facts are taken which resemble one another in certain respects, they are thrown into classes according to their common features, and the results are expressed numerically. So long as the facts are simple and the points of resemblance few, the danger of error is small. To ascertain the number of human beings existing in a certain place on a certain day is perhaps the easiest statistical task undertaken upon a large scale by governments, yet a moment's consideration is enough to show that the results can be only approximately true. The census-takers may, and it is known that they often do, falsify the returns. When they are paid, as they often have been, according to the number of heads which they return, it is obvious that they are tempted to swell the figures of population. There are always people who cannot be seen—who are asleep, or sick, or away—and the enumerator has to accept other evidence than that of his own senses as to these. There are great numbers who are to be found in more than one place upon the same day, and some of them are likely to be counted twice. There are others who for the same reason may not be counted at all. The gross discrepancies between the censuses taken in the city of New York by the United States and by the municipal police are too recent to be altogether forgotten, and they illustrate the influence which political considerations may have upon what might be supposed to be the simplest of arithmetical problems.

But when the census-taker is required to do more than simply count the population, his task becomes infinitely more difficult. Investigations as to age are so notoriously unsatisfactory as to give immortality to jokes that must have been stale long before the Christian era. It is said that Wat Tyler's rebellion was occasioned by too pressing inquiries as to the age of his daughter, and Mr. Wright remarks that "an examination of the age statistics under any census or in any country will show a concentration upon the fives. It is much easier for a man to say he is twenty-five, or thirty, or thirty-five, when the enumerator asks the question, than to give his exact age." Nevertheless, Congress has from census to census increased the number of questions to be answered by the people until it is now twenty-nine, covering age, sex, nationality, employment, physical conditions, educational qualifications, naturalization, disease, etc., etc. Many of these questions are answered in the absence of the heads of families by children and servants, frequently with the most grotesque results. In some regions the death-rate has been ascertained by this scientific process to be 2 in 1,000. The superintendent of the census, of course, knows that such figures are false, but he has to use them, and we have the spectacle alluded to by Mr. Wright of a superintendent warning the public to place no confidence in his returns, while prominent physicians were presenting the conclusions to be deduced from them to scientific bodies.

We frequently see startling figures as to the increasing number of the insane presented in the newspapers, giving rise to melancholy predictions. There is probably not the slightest reason for disquiet upon the subject. The definition of insanity, as every one knows, is a

fluctuating one, and it is not only true that many persons are now classed as insane who would not formerly have been so classed, but also more cases are returned than of old. What is true of the statistics of insanity is far more true of those of crime. We do not hesitate to assert that it is utterly impossible to say whether crime in this country is increasing or not. This is not quite true in England, for a number of reasons, and especially because the country is not, like our own, cut up into a number of jurisdictions; but even there no one need attempt to generalize without a practical acquaintance with the details of criminal legislation, of criminal court practice, of police administration, and of prison discipline.

Mr. Wright goes through the whole list of subjects commonly dealt with by the bureaus of statistics—agriculture, manufactures, wages, farm-mortgages, public debts, assessed valuations, etc.—and shows how little value is to be attached to the returns on all these subjects. The worthlessness of the census taken in 1890 was long since exposed in these columns, and the public have not quite forgotten the colossal blunder in the Bureau of Statistics of the Treasury which swelled our imports some $70,000,000 in a single year. But Mr. Wright cheerfully contends that bad figures are better than none, and that we may get nearer the truth if we keep on. Considering the scandalous waste of money in the Census Bureau, to say nothing of the cost of Mr. Wright's own department, and the countless others of like character which the politicians have foisted upon our State governments, we are not so sanguine. Nothing is better worth paying for than accurate information, statistical or other; but the value of false and misleading figures must be expressed by the negative sign.

## *THE CONSERVATIVE REACTION IN EUROPE.*

THE flat failure of the demonstration in London on Sunday against the House of Lords is only one of many signs that that decrepit body is not exactly on its deathbed yet. Of course, the occasion chosen by the National League for the Abolition of the House of Lords was not a happy one. Comparatively few people outside of Ireland took any great interest in the Evicted Tenants bill which the Lords had so incontinently rejected. The fight could much better be made on some measure of national importance, to which a great party was passionately committed, as it cannot be said any longer that the Liberal party, as a whole, is committed to any measure relating exclusively to Ireland. The rejection of the Home-Rule bill furnished a better challenge to a life-and-death struggle. On that issue there was a general disposition among Liberals to make the fight, but Mr. Gladstone discouraged it, and the golden moment passed.

Still, aside from all such questions of strategy and opportunity, there is no denying that the lords are much easier in their minds than they were a year ago. They do not imagine that they are any more respected or better liked, but they have become convinced that the upper chamber will last their time at any rate. They are willing to be considered hateful if only it is admitted that they are a hateful necessity. In this situation their spirits are distinctly rising. Where they used to be melancholy or alarmed or angry, they are now jocose—as jocose as lords ever are. Lord Salisbury, the other day, grew quite jocular when alluding to the threats of abolition, and said that he would fix the date for abolishing the House of Lords at just six months before the Commons were abolished also. Among the radical Liberals, too, there is perceptibly a change of expectation, if not of hope, in this matter of the progress of pure democracy in Great Britain. It was not long ago that they were saying, when the house of hereditary legislators did something more than usually absurd, "What a jolly smash we will make of all that pretty soon." Now they are less sanguine, and have moved the date of the jolly smash far ahead.

Over the Channel, in the land of untrammelled democracy, the swing back towards conservatism is fully as marked. The way the sweeping anti-anarchist laws were put through Parliament in hot haste and by tremendous majorities was an indication of the change which had come over the dream of French democracy. And there is evidence a plenty that this was not simply a temporary panic or reaction of sympathy caused by Carnot's assassination. A contributor to the *Figaro* has been travelling extensively in rural France, and he reports a great change of view among the stiffest republicans of the provinces. Everywhere they asked him about the new President, and their main anxiety was to learn if he was a man of vigor and resolution, with the "necessary grip." One characteristic conversation reported was as follows:

"I am a republican, you understand, and have been ever since the time of Thiers. I cried with Gambetta, 'Le cléricalisme, voilà l'ennemi.' I believed with Carnot that the danger was from the conservatives. I thought the secularizing laws were necessary, and approved the military laws and the school laws and the organization of trade unions, and I endorsed strikes. But what's the use? The evidence is clear that we've gone too far, and everybody is convinced of that even if he does not dare to say so. We are simply perishing with these inflammatory measures, destructive of all authority as they are. What we want of Casimir-Perier is to reverse the engine."

The cause of this conservative reaction is clear to the dullest mind. People are suddenly becoming reluctant to part with any institution, however offensive or anachronistic, which stands for governmental authority and social stability, because they see all authority and stability seriously menaced. Many who were bold innovators a couple of years ago, ready to cry "Down with the Lords!" at the top of their lungs, have begun to look about at their fellow-innovators, and are getting alarmed at the company they are in. Here walks a man with a bomb under his coat, and there is a reformer who wants to abolish private property and rent and "industrial slavery," and who will abolish also law and custom and the House of Commons or anything else that stands in his way. These are the men, with crimes of violence as a part of their political creed, and the destruction of the whole framework of society as their aim, who have been like a draught of *elixir vitæ* to the House of Lords, and are at this moment playing into the hands of the conservatives in every country of Europe.

What they intended, they said, was to hasten the evolution of democracy. The existing process was too slow to suit them. Things were moving their way, they admitted, but it would take a century or two, at the present rate, to bring about what they aim at. So why not hurry up the evolution a little by the aid of incendiary speeches and confiscating laws and an occasional explosion of dynamite? But, alas! democratic evolution is a slow coach that will not be hurried. When you try to frighten it into a faster pace by throwing bombs under the wheels, the postilions have a fashion of turning soldiers, and the passengers begin shooting out of the windows in the most ugly and disheartening way. Then they get out and hold a council of war, and ask soberly if the coach has not been going too fast instead of too slow. Meanwhile, the men in too great a hurry are riddled with bullets or beheaded, or left to watch the painfully slow evolution of society out of a prison window.

## HADLEIGH FARM COLONY.

LONDON, July 30, 1894.

IN a recent number of the *Nation* (July 5, "The Real Problem of the Unemployed") appear these words: "The real problem, therefore, is not to provide work, but to make men competent and willing to work." This is exactly what the Salvation Army professes to do in the Hadleigh Farm Colony, an outcome of the 'Darkest England' scheme propounded in 1890. Gen. Booth obtained more than £100,000 from the English people, and of this sum £85,000 has been spent on the purchase of a farm in Essex (on the north bank of the Thames, and about six miles from the open sea) and on its proper equipment for the training of some 300 men to be drawn and constantly renewed from the London slums.

Shortly after reading in the *Nation* the article already mentioned, I took the train at

Liverpool Street Station for Rayleigh, the nearest Great Eastern station to the famous colony, established three and a half years ago, for the express purpose of examining and reporting upon how far the colony fulfils its aim of training men to work. The Governor, Col. Stitt, sent a vehicle to meet me, and for some miles I was driven over tame but pretty English scenery—beautiful trees, peaceful cottages, grazing cattle, fields of waving corn, green pastures and quiet waters. Presently we descended at the Governor's office, a modest, not to say mean-looking, wooden shanty, reminding one of the dictum of a lady visiting the colony, who observed that they had built a palace for the cows and a pigsty for the Governor. Col. Stitt seems a suitable man for the post: a good eye for land, a kindly manner calculated to produce respect but not fear from the men, infinite patience and faith in human nature; not a man to stand much humbug, nor yet one to expect to make silken purses out of sows' ears. He has a mixture of Scotch, Irish, and French blood in his veins, visible in his judgment, foresight, kindly humor, and suavity. Being busy, he made me over for an hour or two to the care of Staff-Captain Smith, his aide-de-camp and secretary, and in his company I visited several buildings before the midday meal.

The farm consists of some 2,800 acres, of which 1,000 acres at certain periods of the tide are under water, much of which is nevertheless useful for grazing purposes. A long creek or bayou of the Thames lies to the south of this estate; fishing rights in it are let off for the sum of £140 per annum. Three small farms are also let off. The colony managers have the mixed satisfaction of knowing that their settlement has greatly raised the value of land in the neighborhood, as they find when they want to buy portions dividing their estate. A small railway, connecting London, Tilbury, and South End, divides the low marsh land from the higher land sloping to the north. The colony has four miles of frontage to good country roads, and a water frontage of three miles to the Thames. Excellent authorities were consulted as to the purchase of this estate. Mr. Bird, inspector to the Board of Agriculture, gave it as his opinion that "no more desirable, suitable, or appropriate property for the purpose of the scheme could be obtained," and this opinion was confirmed by other competent persons.

What strikes the eye of the visitor to the colony is the scattered appearance of the buildings. They are dotted about here and there, numerous, but far from imposing. True, there is a street, but one side thereof is mainly composed of corrugated-iron cottages, which, though tidy and even trim, are of small architectural pretension. To the right is one of the largest buildings, the Salvation Army Barracks, built at a cost of £630, and rented by the spiritual wing from the social wing at £1 per week. The dormitories are eight in number, of various sizes, and with a little arrangement are capable of holding 350 men. I carefully inspected them. The men are provided each with an iron bedstead, seaweed mattress covered with American cloth, a box for private belongings. My visit was in July, but I was shown the arrangement which exists for heating the dormitories in winter. A lavatory with between thirty and forty basins permits that number to wash at one time; there are four baths at one end of the laundry for the sake of a good supply of hot water. The beds were being sponged with paraffin as I entered, Capt. Smith informing me that the struggle for cleanliness has to be incessant. Most of the men pretty readily acquire decent habits, but the system of recruiting from the London slums lays them open to fresh danger from vermin with each arrival. Many of the men, too, have been on the tramp for weeks or months. They arrive at the colony dirty, footsore, eaten by vermin; boots that will hardly hold to the feet, no shirts to their backs. A crematorium has been built in which the necessary baking process is carried on.

The dormitories are not all exactly alike. As a man rises, as his power to work improves, he gradually acquires little comforts, a better bed, such privacy as a cubicle affords, an improvement in his dietary. The Governor of the colony binds himself to supply only lodging, board, and work. Even the clothes which are supplied to men whose case is desperate, are paid for. This is done by a bonus system, paid weekly on Friday. The colonists receive sums varying from sixpence to four or five shillings, in a few cases as much as ten shillings. Even partially reclaimed workers are not allowed to handle all their bonus; a credit account with the Governor is opened for each man, who must compulsorily save two-thirds of his bonus. In the case of drunkards, great care is exercised with regard to touching even a third of their sum, as outside the colony is the village public-house, a standing temptation to such men. Practically, a night's lodging is not refused to any destitute man in need of it, who appears to claim the help of the Army. On the occasion of my visit, there were 260 men under the care of the Governor. For the most part, they are cases selected from the "Elevators," or Salvation Army workshops in the slums, sent to the Essex farm, on the recommendation of a gentleman of independent means who has some knowledge of the character and suitability of the men whom he recommends.

After visiting the dormitories, we passed to the library, well-stocked with illustrated periodicals, to the laundry, kitchen, refectory, smoke room, boot-making department, to a capital dairy fitted up with the latest improvements, to the piggeries, with fat, snorting pigs rooting among the fodder, to the palatial cowshed with forty-eight sleek milch kine, excellent specimens of Salvation cattle, to the tomato houses, with heavy clusters of ripening fruit. A small drawback seemed to be the bad roads and the plague of flies which almost infested the place. The managers urgently need £2,000 to make roads; walking on clay in wet weather is a heavy job, and housewives complain that the clay will not remain outside. Flies seem to abound in the neighborhood of farming operations; cattle and manure attract them in thousands. Their size, audacity, as evinced in an insolent buzz, struck me as phenomenal; their determination to inspect everything far surpassed my own.

The number of the colonists has been mentioned as 260; it must be understood that besides there are about 100 permanent officials, superintendents, heads of departments, foremen of different industries, who do not change, and who form the framework of the unskilled labor; they are the element which lends cohesion to the scheme. About 40 acres have been planted with fruit-trees and plants, and 60 acres have been converted into a market garden. Both these enterprises pay well; the colony is within 6 miles of Southend-on-the-Sea, a health resort filled with visitors just at the time the colony has large quantities of fruit and vegetables to dispose of. As already stated, a small railway runs through the farm colony; considerable dissatisfaction exists because the company shows no inclination to treat the colony reasonably in the matter of a small station or even a good siding. In the matter of fruit it is safe to say that Salvation strawberries, rasps, currants, yield to none in quality, and in a few years the fruit-trees will, it is expected, give an excellent return for expense incurred. Fruit-picking within reach of London is generally given over to the denizens of the slums, who are conveyed to the scenes of action in train-loads, and usually convert the rural scene into more or less of a slum during their labors. At the colony great care is exercised in the choice of pickers; the moral experiment, which forms a large half of the scheme, will not allow of indiscriminate association. For the same reason the colony is as complete in itself as the Governor can make it, in order to prevent the necessity for much communication with the village. Even a tobacco license has been obtained, for though thorough-going Salvationists do not approve of tobacco, they find that some concession to human weakness is the highest wisdom. Permission to go beyond the colony has to be asked, but as the tract is several miles in length, this is not so great a hardship as one might fancy. Games, too, are provided for the men; football, cricket, quoits, racing, jumping, tug-of-war, are all encouraged.

The very night before my visit, so the Colonel told me, a man had asked permission to attend the village church, and as he was steady and industrious, he readily obtained it. Alas, he visited the public-house, spent his ready money on bad whiskey, and the next morning, feeling that he had disgraced himself and the colony, he decided to depart, and informed the Colonel of his decision. Good; his account should be made up and his savings made over to him. When he appeared at the office, crest-fallen, bundle in hand, in his kindly way Colonel Stitt led him to talk over the whole affair, to acknowledge the error he had made; and by wise encouragement as to the good work he had done, and the physical benefit received from his stay at Hadleigh, the man was led to reconsider the matter and finally to return to his place.

Later in the day the Governor had a trap harnessed, and we drove as far as the roads would permit, to inspect other industries in operation on the farm. A rabbit warren with 1,200 rabbits reared for the market and a thriving poultry-farm interested me much. We drove round fields of waving corn, wheat, barley, oats. The rich alluvial ground grows excellent crops, and unless rain-storms do mischief now, the harvest will be the heaviest England has had for years. A wharf has been built on the water-way; cheap water-carriage may possibly induce the railway to hear reason in the matter of a good siding. We visited the saw-mills, the wheelwright's shops, blacksmith's shop, the brick-making industry. This last is somewhat important, employing forty men. Excellent brick clay is found on the land, and this is wisely utilized. Nearly all the bricks used in the colony have been made at the kilns, and a large and growing market is found for the bricks both in the immediate neighborhood and in London. As already stated, a considerable number of the cottages are built of corrugated zinc; the dormitories have a brick foundation, but are mainly wooden. On returning from the wharf, we rode back in front of a locomotive. The colony has been enterprising enough to build a railway connecting the wharf and brickworks, at

an expense of £8,000. This was done by the advice of a noted railway contractor, who agreed to build it without any profit to himself.

Probably it would be a difficult matter to get any two experts out of a score to be of one mind as to the advisability of the expense incurred by the colony in these various enterprises. About eighteen months ago rumor was rife that the expense had been enormous, that money had been thrown away doing this and that, and that the Booth family were making an uncommonly good thing of the 'Darkest England' scheme. It may here be said by the way that the social and spiritual wings of the Salvation Army are kept perfectly distinct, both in management and in their accounts. The Booth family are, to the best of my knowledge, all engaged in spiritual work; the colony does not even afford a post for one of them. It is difficult to get a valuable opinion on the subject of the outlay incurred at Hadleigh; but as the rumors against the Booth family grew, and proved very distressing to them, and likely to cripple the work of the Army unless authoritatively contradicted, a committee of inquiry was appointed to investigate the manner in which the moneys collected for the 'Darkest England' scheme had been expended. The result of the inquiry was damaging to those who spread these reports. The committee found that there was no reason to suppose that Gen. Booth or his family derived any benefit whatever from the scheme. They agreed that it was difficult to form an opinion as to whether the money spent on the farm had been judiciously laid out, but gave great weight to the opinion of practical men, who all without exception approved the farm colony. On the whole, they found no evidence of waste of money, but considered the scheme had been well thought out and every reasonable effort made to secure success. At the time the committee of inquiry published their report, 1,002 men had been received on the colony. Of these, 462 were sent to situations; 140 left on their own account, some having run away; 88 were dismissed; 312 remained on the farm.

Talking with the Governor over the grave difficulty of reforming men, of changing the human rubbish of the London slums into desirable colonists, he did not attempt to conceal that they had their failures. Having to do with a considerable number of men who have never been used to regular work, and who are at first physically not very fit for continuous effort at pretty severe labor, their experience is that these men count very much upon their work, some of them seeming to fancy that the colony is making a fortune out of them. The Governor was of opinion that if it were not for the moral responsibility they incurred by care of the men, if they were not burdened with the anxiety of finding work for them in wet and wintry weather—in a word, if their relations with their "hands" were those of the ordinary employer and employed—the colony would soon be a monetary success. It is only fair to remember that this part of their work is very heavy, entailing mental strain and anxiety, breaking continuity of work, involving relations with persons alive to the axiom, "All for each," but not "Each for all." Especially anxious is the time beginning on Friday night (pay-time) and lasting until Monday morning. From Saturday noon to Monday morning is the great drinking-time of the English working-classes. When the hours of labor are finished, the men are under the care of a warden, who attends to discipline, and whose vigilance has been found strictly necessary. On the whole, it seems probable that the colonists are not very grateful for what is done for them, though there are men who write and thank the officials for the fresh encouragement and start in life which they obtained at Hadleigh.

It must be remembered that the colony suffers a good deal from lack of funds, which cripples it in two ways. It prevents various developments both useful and necessary upon the colony itself, especially those which would provide the men with work in winter. Secondly, the lack of funds will not allow of the beginning of the Oversea Colony, an essential part of the scheme, which would insure the drafting of reformed colonists to another land. Their training is often lost, or seems to be lost, for lack of proper completion and the correlation of the different parts of the 'Darkest England' scheme. Gen. Booth has had 8,000 square miles of land surveyed with a view to establishing this Oversea Colony, land of astonishing fertility, with tin, coal, and timber upon it. In passing judgment on Hadleigh we must remember that the loom of time has not yet woven the complete pattern; that the human material the colony works upon is not of first-class quality; and lastly, that more than 50 per cent. of the colonists seem to turn out well, and a considerable number may be said to have shown improvement.

On an average, the colonists seem to stay from six to eight months on the colony, a period by no means long. Often, on leaving, they have a sum of £3 or £4 with which to start life afresh. One or two boards of guardians have sent the Governor able-bodied paupers to set to work, paying five shillings weekly for each man. England spends £10,000,000 annually on a gigantic failure known as the administration of the poor laws. It seems astonishing that she should not be alive to the need of subsidizing the Hadleigh Farm Colony, especially in view of the fact that wretched land-laws and bad social conditions have produced the social failures with which the Farm Colony deals. In Australia the different governments have subsidized three Salvation Army farm colonies, established on Hadleigh lines. The Governors of Australian provinces evince the greatest interest in the experiment, not only in the form of a subsidy, but in personal visits and in moral support. One might almost fancy that the advent of the York baby was of infinitely more importance to the solid but sentimental Briton than a social experiment of such magnitude as the one I have faintly indicated.

C. S. Bremner.

## THE FOURTH CENTENARY OF CORREGGIO.

London, August 4, 1894.

Four centuries have elapsed since the birth of Correggio. Parma is celebrating the event by industrial exhibitions and agricultural shows. We can celebrate it in our own way by trying to go back of the almost delirious adulation on the one hand, and of the Ruskinian vituperation on the other, of which Correggio has been the object.

Surely criticism may occupy itself with other tasks than praise or blame. It should endeavor first of all to discover and define the artist's real capacities and qualities. Then, if our interest be merely personal, we can abandon ourselves to liking or disliking; while if it be historical, we know what to think of the age which adored or abhorred the artist in question. What, then, was the quality of Correggio's genius as revealed in his works? To appreciate this quality we must first note with what other artists Correggio shared the Italian field of painting, and what influence went to form him.

At the beginning of the sixteenth century, Italy saw the rise, in every school, of painters in whose work the element of beauty and of real life so far outweighed the elements which were merely characteristic of their own school and epoch that their pictures, even now, can be enjoyed with no special preparation. To appreciate Raphael, or Michelangelo, or Titian requires none of the education in history and in the art that one must have to appreciate such masters of the fifteenth century as the Vivarini, Pier dei Franceschi, or Botticelli. Correggio is one of the "modern" artists, and holds among the painters of the district between Bologna, Ferrara, and Parma the place that Raphael holds among the painters of central Italy, Michelangelo and Andrea del Sarto among the Florentines, or Titian and Lotto among the Venetians; and he is as much the outcome of the artistic endeavor of that part of Italy as Andrea, Raphael, and Titian are of Tuscany, Umbria, and Venice.

Correggio may have got his rudiments from some local master in his native town, or in the neighboring town of Modena; but in his very earliest paintings he shows himself as the unmistakable pupil of Costa and Francia, in whose workshop at Bologna he must already have been before 1509. In that year Costa went to Mantua, and probably took Correggio with him, for several pictures painted by Correggio in the next few years bear witness to the study of certain works by Mantegna which he could have seen in Mantua alone. At Mantua also he came in contact with a painter who saved him, perhaps, from becoming merely a perfected Costa or Francia. This was Dosso Dossi, an artist of great imaginative power, with a mastery of color as splendid as that of any Venetian, and with a skill in the treatment of light and shadow at first almost unrivalled. He communicated an ardor to the young Correggio—whose own nature was from the first sensitive and lyrical—which prevented him from painting all the rest of his life pictures merely dreamy, sweet, and antiquated, such as Costa's. It was to Dosso, too, that Correggio owed the first impulse to that study of effects of light and shadow, and of aerial perspective, in which he afterwards went beyond everything that had been done before him.

The nine or ten pictures which Correggio painted before his twenty-first year show with remarkable clearness just what was his own personal quality and what he owed to his masters and to Dosso. The forms and types, nearly all that has to do with the mere design, come from Costa and Francia, while the treatment of light and shadow and much of the coloring is distinctly Dossoesque. But the intensely felt religious emotion, impregnated with poetry, which is expressed in the faces and in the landscape accompaniments, is his own, and is as perfectly distinct from the dreaminess of Costa as from the fiery fancy of Dosso. These earliest works are his most genuinely religious pictures, and in all art it would be hard to find their equals for delicacy and sincerity of feeling. Their aim is not, like that of the religious paintings of earlier generations, to inspire us with contrition and awe, but to put us in sympathy with the marvellous poetry and the deep humanity of the story of Christ. All through his life Correggio's nature continued unchanged; it remained sensitive

and lyrical. When he had a subject to paint, he chose to dwell entirely upon the elements of feeling in it, and to express them with the utmost rapture. This may be called the law of his being, and he is completely satisfactory when the subject gives full scope for his genius, and less satisfactory when the subject does not lend itself to a rapturously emotional treatment.

In his youth, his lack of skill, his tentativeness, his own immaturity, hampered him. He had not yet that mastery which afterwards enabled him at the same time to express all the rapture of feeling within him and to make it seem real. This required an extraordinary skill in draughtsmanship, and, above all, an understanding of light and shadow, which he attained only later, although early enough in his brief life. At first it was as if his only instrument had been the harp and he expressed only what the harp could express. But his means of expression increased until at last he had in his hands an instrument as powerful and as responsive as the orchestra. So in his early pictures, his expression of emotion was restrained and quiet, and was admirably suited to the religious subjects which he then treated. But in such a picture as the "Madonna with St. Francis" at Dresden, painted in his twenty-first year, the emotion is already a trifle too much for the subject. He represents the Madonna and saints, wishing to keep to the architectonic form of the conventional altar-piece. But the figures have so much feeling of their own to express that they stand uneasily within the bounds of the prescribed composition. In such a picture, however, as the "Zingarella" at Naples, painted only a little later, where he had nothing to express but the emotion of a mother passionately caressing her child, no touch of exaggeration is felt. So also with the "Nativity" in the Uffizi, painted a few years later, where there is nothing but a young mother trying to attract the attention of her little baby. Correggio is in fact faultless as an artist whenever the emotion he had to portray was purely human and joyous, no matter how refined or how ecstatic.

He spent the twelve most productive years of his life, from 1518 to 1530, at Parma, and there he found ample opportunity for the kind of painting in which he could give full swing to his genius for the expression of intense feeling. In the choir of San Giovanni he painted the Coronation of the Virgin. The Madonna here does not, as in the usual treatment of the subject, kneel like a meek handmaiden, crushed with the honor that is being conferred upon her, but throws herself into it with rapture, as into a joy of which she means to possess herself to the utmost. The St. John in the same church seems likewise to abandon himself to the ecstasy of his inspiration. In the cupola of the cathedral he painted his famous Ascension of the Virgin. She is surrounded by figures all striving to be on a level with her own intense exultation as she gives herself up to the unspeakable bliss of rising to the highest heaven. The abandonment to the utmost possible human joy is far greater here than even in Titian's "Assunta." Every one of the whole host of accompanying angels seems an embodiment of the jubilant triumph which the Virgin herself feels, and which sweeps through the whole universe at the same moment.

Having such a preference for a rapturously emotional treatment, Correggio was at his best only in such subjects as these, and not in subjects which required the expression of sorrow or of resignation. So, in a picture like the "Martyrdom of Placidus and Flavia" (in the Parma Gallery), Flavia abandons herself in an ecstatic vision, and is therefore one of the finest figures Correggio ever painted, while Placidus, who tries to look believing and resigned, succeeds only in looking jesuitical. In his one Pietà, also, Correggio is far from being at his best, although the dead Christ is a splendid figure, just because in him there is nothing that suggests sorrow or pain. Again, with such a preference for an emotional treatment, he naturally ended by choosing subjects in which there was nothing to fetter his full expression. These he found in the love stories of the gods; and in his "Danaë," in his "Io," and in his "Leda," he portrays human beings so utterly given up to an all-possessing emotion that they tremble with it like the ripple of water under a breeze.

It was his passion, too, for the expression of joyful feeling that led Correggio to seize every chance to paint *putti*—little children as artless and simple as real childhood, but bearing far greater joys than childhood ever felt. His first commission at Parma was to decorate the parlor of the Convent of San Paolo; and this he filled with *putti* peeping from behind trellises, sporting with garlands, and playing with instruments of the chase, all in eager sympathy with the huntress Diana, who forms the centre of the composition. His success in this, no doubt, gained him the commissions that kept him so long in Parma; for, from its beginnings, the Renaissance had made the *putto* the symbol of its own joy in life and of its own emotions, and a painter who put into his *putti* all the life, simplicity, and restlessness of real childhood, and at the same time all the immense rapture and joy in mere existence that Italy was feeling in the beginning of the sixteenth century, could not fail to be appreciated.

This intense and rapturous emotion might have become cloying in the end if Correggio had not always been as unstudied and as unconscious as he was emotional. In his mere craftsmanship, too, he seems to have been the most unconscious of artists, never dreaming that he would be admired or blamed for his astonishing foreshortenings, or for his broad, almost modern, treatment of light and shadow. In this, indeed, he had scarcely a rival, even among the later Venetians. None of them, not even Tintoretto, treated effects of diffused light with such success as he. In his ripe years he loved effects of broad daylight and landscapes sparkling with sunshine, as if he could not have light enough to bring nature into complete harmony with his own rapture. His landscapes seem therefore to pulsate with joy under the full sunlight, and he gives fields and trees that look of gayety which they have in the early summer.

His coloring was throughout on a level with the intense joyfulness of his feeling and with his sunny landscapes. Distinct from the Venetians, he was in no way inferior to them, except that color and brushwork did not with him, as it did with the Venetians, become a distinct instrument of expression. But where he is unrivalled, either by them or perhaps by any other Italian painters, is in the flesh painting of the one or two perfectly preserved pictures which we still have. Flesh that looks so real as that of the "Antiope" in the Louvre, it would, perhaps, be hard to find anywhere else.

Correggio's genius, as we have seen, was throughout emotional and lyrical. Lyrical feeling rarely goes with the power of unemotional observation such as good portraiture requires. It is not surprising, therefore, that not a single portrait by Correggio exists.

It happens that the English poets afford striking parallels to the Italian painters. Thus, there is a decided similarity of genius between Shakspere and Titian, and between Michelangelo and Milton. A lover of these poets cannot help finding the corresponding painters much more intelligible. But centuries had to elapse before emotions so intense as those Correggio felt found expression in literature—in Shelley when he is at his best, and in Keats when he is perfect.

BERNHARD BERENSON.

# Notes.

GINN & Co. announce for next month 'The Roman Pronunciation of Latin; Why we use it, and How we use it,' by Prof. Frances E. Lord of Wellesley College. They will also publish in their College Series the 'Odes and Epodes of Horace,' edited, with introduction and notes, by Prof. C. L. Smith.

The long-awaited 'Shakspere Concordance' of Mr. John Bartlett is now promised by the Macmillans for issue early in September. The 400,000 entries witness to the aim at completeness, while the care taken to secure minute accuracy is shown in the fact that references are made, not alone by act and scene, but as well by line, according to the numbering of the Globe edition of Shakspere. The same firm's new edition of Mrs. Oliphant's 'Makers of Florence' will be in four volumes, sold separately, which will be devoted, respectively, to Dante, Savonarola, the Castle Builders, and the Piagnoni Painters.

G. P. Putnam's Sons will issue in the autumn a volume of poems by Francis Howard Williams of Philadelphia, mostly unpublished hitherto. From their press also will speedily appear part ii. of 'Social England,' edited by H. D. Traill. This instalment carries the narrative to the death of Henry VII.

From the Scribners' list of forthcoming books we single out the third and concluding volume of Pasquier's 'Memoirs'; 'Johannine Theology,' by Prof. G. B. Stevens of Yale; 'William Shakspere: A Study of Elizabethan Literature,' by Prof. Barrett Wendell; Mrs. Alice Morse Earle's 'Costume of Colonial Times'; 'The Making of the Ohio Valley States,' by Samuel Adams Drake; 'Musicians and Music Lovers, and Other Essays,' by William F. Apthorp; and finally, the Sherman Letters, being the correspondence between the General and the Senator.

Another American general, R. E. Lee, is to be the subject of the next biography in the "Great Commanders Series," published by the Appletons. This volume is to be done by Gen. Fitzhugh Lee, whose military and personal relations to the Confederate chief argue special equipment for the task.

The problems of the theatre are among the most interesting just now in Greek archæology. We note the announcement by Klincksieck, Paris, of an 'Étude sur l'organisation matérielle du théâtre athénien,' by O. Navarre, Maître de Conférences à la Faculté des Lettres at Toulouse. As to the stage-question, we imagine that, notwithstanding the publications of Bodensteiner, White, Pickard, Capps, and many other able students, no one who has not studied the theatres in Greece itself will make up his mind before the appearance of the long-promised work of Dörpfeld and Reisch.

Under the title of 'Shylock and Others'

(London: Fisher Unwin; New York: Scribners), Mr. G. H. Radford has gathered eight little essays closely akin to the paper on *Falstaff* contributed by him to the first series of Mr. Birrell's 'Obiter Dicta.' The paper on *Shylock* is refreshingly free from the pedantry which weights down so much Shaksperian criticism; and those on the "Sources of 'Hamlet'" and "*Hamlet's* Madness" are useful in drawing attention to what many commentators ignore—the extent to which the great dramatist was bound by the plots he borrowed from his predecessors.

Bernard Palissy is one of those men who, as Töpffer used to say, are famous but little known. That he was an artist, that certain ware bears his name, that a legend has arisen about him, is the sum and substance of what the great majority of his countrymen know of him. M. Ernest Dupuy, in his 'Bernard Palissy' (Paris: Lecène, Oudin & Cie.) tells his public of the man, the artist, the scholar, and the writer—for Palissy was a writer of uncommon power and much originality. But, above all, as M. Dupuy well remarks, Palissy was a high-souled, noble-minded man, and for this reason, if for no other, his name will live in French annals. The study now given us is very full and detailed, a little too much so at times, but so conscientious and interesting that one easily forgives occasional over-developments. A glossary of words peculiar to Palissy and a brief bibliography add to the value of the work.

'Alfred de Vigny et la Poésie Politique,' by M. L. Dorison (Paris: Perrin & Cie ), is a careful study of the poet's beliefs as expressed mainly in that remarkable collection, 'Les Destinées.' M. Dorison has become very familiar with Vigny, and he has set out clearly the doctrines which "Le Mont des Oliviers," with its terrific closing stanza, and "La Maison du Berger" contain. The whole book is a particularly earnest effort to distinguish Vigny's aims and to prove that the poet sought to express a new symbol of life, perceiving that the old forms were worn out and that new generations, with new needs, required a new creed, a new object to be attained. This study of Vigny from the political and social point of view is indispensable to students of Romantic literature in France. It exhibits plainly the fact that the school possessed thinkers.

In 'Vie et Science' (Paris: Colin & Cie.) M. Henri Berr discusses, under the form of letters exchanged by an old philosopher of Strassburg and a Parisian student, the great questions which underlie daily life. Serious in tone, earnest of purpose, M. Berr succeeds in being interesting; and the frivolous, particularly the thoughtless, the careless, would profit by the perusal of this little book, which contains much food for reflection within a small compass.

'Savinien de Cyrano Bergerac' forms the subject of a volume signed G. Ant. Brun and published by the house just named. It is a thesis for the doctorate, crammed with information, attractive in parts but not very entertaining on the whole, though the subject lends itself to a brighter treatment than has been accorded to it. It is useful as a work of reference.

If we had any reason for being interested in Signor Angelo Conti, his book on Giorgione (Florence: Alinari Bros.) would be absorbing. He begins with a chapter on style, and ends with an epilogue on art and criticism, and, in between, discourses of the "Supreme Vision," the "Insufficiency of the Symbol," of Bach and Wagner, of Pater and Goethe, alluding once in a while to Giotto, Leonardo, Rembrandt, and even Giorgione. We thus learn that Signor Conti has "cultured" tastes and interests, but we do not see why he should entitle a book about himself 'Giorgione.' The illustrations, by the way, are good, and among them, almost as if by accident, are a few of genuine works by Giorgione.

A London bookseller named Tregaskis has two or three times taken many copies of the same book and sent them to as many bookbinders all over the world, and then exhibited the result in his own shop, the Caxton Head. The last book chosen was the Kelmscott Press edition of Mr. William Morris's 'King Florus and the Fair Jehane,' with initials and borders designed by the translator. Sixty-seven copies of the work are described in the catalogue as having been bound all over the world, in London and Paris and Venice, in Japan and Java, in Siam and Persia, in Montreal and New York and Memphis, Tenn. The binding designed and executed by Mr. Otto Zahn in Memphis, though a little stiff in outline, is thoroughly workmanlike. Excellent facsimiles of it and half-a-dozen other covers give value to the publisher's catalogue, to which is prefixed a futile introduction by Mr. Cyril Davenport, F.S.A.

The twenty-fourth annual report of the Lenox Library in this city enters into minute details concerning the chief acquisition of the year, the library of the late George Bancroft, which was let slip by Congress. It is of priceless value to the student of early American history. Purchases from the private library of the late George H. Moore also procured some rarities in the same line, and these and the Bancroft collection enabled the library to complete its series of the Jesuit *Relations* of New France in the original editions without a break (1632-1673). The Rev. Dr. Wendell Prime gave freely his remarkable Cervantes collection in 435 volumes. Some precious early printed books of the fifteenth century were acquired, one on vellum with miniature paintings over woodcuts, whose only known fellow is in the National Library at Paris.

The number of historical monographs now appearing on the subject is gratifying in direct proportion to the neglect of all our text-books, the newest like the older, to give anything like a consistent view of the cause of the revolution of 1860. The twelfth in the Publications of the Indiana Historical Society is a collection of "Slavery Petitions and Papers," showing the persistent attempt of a part of the inhabitants of the Territory of Indiana, from 1796 to 1807, to obtain of Congress a suspension of the Northwest Ordinance so far as it prohibited slavery. The compiler is Mr. Jacob Piatt Dunn, the historian of the State in the American Commonwealths series. Congress was more than once advised by its committees to accede, but there was a natural reluctance so to do in face of the approaching prohibition of the slave trade; and the anti-slavery settlers also put in a strong counter-petition. The humanitarian arguments advanced for admitting to the territory this "evil" forced upon the colonies by sordid England—as that it would improve the fare and treatment of the slave and tend to his gradual emancipation, while relieving the South of the dangers of insurrection—were as hollow as the economic, viz., that Indiana (in spite of Ohio's example) could not be developed by free labor. Our late President's grandfather, we are pained to observe, cut a prominent figure among the promoters of this movement for "cheap labor," in a region "where laborers cannot be procured to assist in cultivating the grounds under one dollar per day, exclusive of washing, lodging, and boarding; and where every kind of tradesmen are paid from a dollar and a half to two dollars per day." Many were tempted to "remove to the Spanish dominions, where slavery is permitted, and, consequently, the price of labor much lower."

Something new and instructive may be gleaned from a rather confused and limited performance, 'Slavery in Rhode Island, 1755–1776,' by William D. Johnston, whose paper issues from the Historical Seminary of Brown University. For instance, there was, in 1743, an act "for the more effectual punishment of negroes that shall attempt to commit rape on any white woman"; which implies that lynching was not the habit of the Rhode Island community. Mr. Johnston is quite as laudatory of the Quakers as the facts will warrant; but had his narrative come down to the period before the civil war, he would have had to record subserviency to Southern trade and Southern summer residents, and hostility to abolitionists, on the part of the Friends in Newport not at all distinguishable from like displays by the "world's people."

Much better is the 'History of Slavery in Connecticut,' by Bernard C. Steiner, Ph.D., one of the Johns Hopkins University Studies. There are many natural parallels between the customs and legislation on this subject of Rhode Island and Connecticut. Mr. Steiner has not exhausted the accessible sources, and he sometimes falls into error, as in regard to the Rhode Island Anti-Slavery Society of the eighteenth century, its date of formation and its membership. He has overlooked the original documents showing the genesis of Prudence Crandall's enterprise, and some of the larger consequences of the previous movement to found a colored manual-labor school at New Haven. Slavery was not finally abolished in Connecticut till 1848, but the persecution of Miss Crandall occurred in the period of gradual emancipation and at the time of the passage of a personal-liberty bill applicable to fugitive slaves. The *Amistad* trial is well related by Mr. Steiner.

A recent publication of the Weather Bureau in Washington is the summary of the international meteorological observations which appears as Bulletin A. The daily simultaneous observations of which this is a summary were taken in accordance with the plan formulated at the Meteorological Congress in Vienna in 1873. From 1875 to 1887 inclusive, these simultaneous observations were taken at all the signal stations in the United States, at nearly five hundred places in other portions of the world, and on nearly six hundred vessels in all seas, the whole aggregating upwards of 150,000 monthly reports, representing more than 5,000,000 daily observations. The preparation of the charts was begun by Major H. H. C. Dunwoody in 1886, and continued at intervals for five years. Nearly half of the charts were published in connection with the Chief Signal Officer's report in 1891. The work, including the preparation of the text, has been continued by Mr. E. B. Garriott, under the direction of Major Dunwoody, the whole being completed about a year ago, at which time it received a limited distribution. The plates number sixty-one, presenting the normal average barometer, temperature, winds, and changes in barometric pressure, various comparisons of these data, and storm frequency and storm-tracks. The work seems to have been well done in its details and the plates are well printed. The principal criticism which

may be urged against it is that no weight has been given to the observations; series including few observations of poor quality, in regions where observers were scarce, being counted as of equal value with large series of excellent ones. With regard to the storm-tracks, a method based on the statistics of areas of a given number of degrees square was used, no allowance being made for the decrease of these squares in size with increasing latitude, the result of which has tended toward a deflection to the south of the storm-tracks. The value of the compilation for the use of the forecaster of weather might have been enhanced had a different principle been followed in the reduction.

The Marine Biological Laboratory at Wood's Hole, Mass., has just concluded its seventh summer session, the most successful in its history. The number of students and investigators in attendance was 133, representing 70 colleges and high schools. Courses of instruction in zoology and botany were offered, a new building for the accommodation of the students in the latter course having been erected. The important part played by the Laboratory in the development of the biological sciences in this country is evidenced by the fact that no less than 58 of those in attendance were carrying on research in zoölogy, botany, or physiology, and that several important investigations were completed during the summer. A number of the lectures delivered at the Laboratory during the session will, as in former years, be published in book form.

—In her interesting little book, 'The State and Its Children' (Methuen & Co.), Miss G. M. Tuckwell shows the great silent revolution which has been accomplished during the present century in the attitude of the State towards the children. At the beginning of the nineteenth century, saving the power of death only, it is not going too far to say that a father had absolute rights over his child. The course of legislation has greatly modified the old parental position. A child cannot now in England work even as a half-timer below the age of eleven, nor as a whole-timer until the age of thirteen, when he must possess a certain certificate of elementary education, the standard varying with the neighborhood; without this certificate he or she may work as a whole-timer at the age of fourteen. Whole time varies; in many factories it is ten and a half hours daily, except Saturday, exclusive of meals. In England, what is known as the "domestic workshop" is very common. Work is taken home by a parent to finish, and such work-places are excluded from the scope of the factory acts. Children, therefore, may be, and often are, set to work in them. Compulsory education rescues them from this fate to a certain extent, though the parent can evade the compulsion a good deal by irregular attendance. Parents can be punished by law for keeping their children in a filthy condition, for starving them, or beating to the extent of ill-usage.

—Miss Tuckwell shows further that much fewer children are sent to prison nowadays than in past times. Reformatories and industrial schools are built to receive youthful criminals and those charged with an offence punishable by imprisonment, but not previously convicted of felony. A young person may not be sent to a reformatory under the age of sixteen, and must, to the author's regret, have undergone more than ten days' imprisonment in jail. Children sent to industrial schools must be under twelve and guilty of some offence; or children up to the age of fourteen for whom the State must make provision. Such children must have parents undergoing a term of imprisonment, or be found unmanageable in the workhouse, or require to be removed from the company of thieves or prostitutes, or be truants in whose neighborhood exists no truant school. Miss Tuckwell finds that the parents of these young wards of the State are mostly worthless and egregiously selfish persons, allowed, by the immense respect England still retains for parental rights, to constantly interfere in arrangements made for the benefit of their children. They readily abandon them when helpless, and with audacity claim them as soon as they have become, or are on the point of becoming, wage-earners. English colonies, like England herself, have tried the barrack system for children, only to discard it because of its wretched results in physical depression and disease, in mental and moral apathy. Like several of our own States, South Australia will not permit parents to interfere with the welfare of children over whom the Government has been compelled to assume control. It is strange to find that English mine regulations permit a boy between twelve and thirteen to work for fifty-four hours per week in the mine. Working aboveground such boys would be allowed to work only half-time. Miss Tuckwell desires as practical reforms that no children under fifteen years of age should be permitted to work, and that the standard of exemption should be fixed by law and not left to the often unenlightened views of local authorities.

—In a recent number of the *Ephemeris Archæologike*, published by the Greek Archæological Society in Athens, Prof. John Williams White discusses the interesting question whether the so-called "Pelargikon" existed as a fortification in the time of Pericles and subsequently. In the early history of Athens, it undoubtedly defended the western and southern slopes below the Acropolis, and, together with the enclosing wall of the summit, constituted the chief security of the early settlement, in the same manner as the Acropolis of Mycenæ or of Tiryns. It continued to serve the same purpose, every one is agreed, as late as the sixth century A.C. Dr. Dörpfeld and others maintain that, after the invasion of Xerxes, it was repaired and retained its ancient uses from the time of Pericles even as late as the period of Herodes Atticus. Prof. White strongly combats this view, asserting that the Perlargikon was not restored, and that the Acropolis from the age of Pericles existed as a region consecrated to the worship of the deities, and as a secure place of deposit for treasure, but not as a fortified defence of the city. He examines in detail the opposing arguments and the passages from Thucydides, Lucian, and Aristophanes on which they are based; and, to our mind, makes good his position with perfect clearness and conclusiveness at every point, by a number of converging proofs. Finally, he points out the superfluousness of such a defence, after the "long walls" were built from the Peiræus, and the ugliness of a massive, rudely built enclosure obscuring to some extent the superlative beauty of the Parthenon and the Propylæa. As the modern Greek tongue is not a gift of grace to professors of ancient Greek, it may not be amiss to compliment Mr. White on the ease and lucidity with which he handles a language that has proved itself adequate to every demand of modern thought and science.

—The story of "La Nônne Alferez," which M. José-Maria de Heredia translates from its Spanish original (Paris: Lemerre; New York: Meyer Frères), has at first sight quite the look of the adventurous and picaresque romances of cloak and sword common in the seventeenth century. But it is not a romance at all. The nun lieutenant was a real personage of flesh and blood, and herself wrote these memoirs of her stormy life. The record of her baptism still exists. She is mentioned by many of her contemporaries; her portrait was drawn with pen and brush; the first and second parts of her 'Relación' were printed and reprinted during her lifetime, and she even attained the honors of the stage, as the heroine of the 'Monja Alferez' of D. Juan Perez de Montalvan, pupil of the great Lope. Two hundred years later, 1829, M. Joaquin Maria de Ferrer published, through the house of Jules Didot, the full text of the 'Historia' after the manuscript of the historian Muñoz, accompanying it with numerous notes and a wealth of "pièces justificatives" of all sorts and kinds. This book is now of very high rarity, though it appears that De Quincey must have had a copy of it, and have drawn from it his story of the 'Spanish Military Nun.' De Quincey's well-known book gives an account of the facts of the life of Caterina de Erauso sufficiently full to make it unnecessary to go into any details here. But, compared with his original, his book is dull indeed. His story creeps, leaden-footed, where Caterina's own relation flies. She used her pen with the same directness that she used her dagger, and her sentences go as straight as her pistol-shots. M. de Heredia has done well in rescuing from the thickening shadows of oblivion such a vivid and alert piece of writing as this is.

—Baldassare Castiglione's 'Cortegiano,' far from being a quaint and merely curious treatise on sixteenth-century etiquette, introduces us to a group of fascinating people discussing many of those questions of polite ethics, urbanity, and culture that have occupied our own eighteenth-century essayists. Castiglione should be regarded as the precursor of Addison, Steele, and Swift, more even than of Montaigne, for the great charm of the 'Cortegiano' is its note of personality, its touching on the various foibles and prejudices of the interlocutors. The *dramatis personæ* are always kept in character, so that the discussions are more like certain "psychological" novels of to-day than like the ordinary Socratic dialogue. But hitherto only the specialist had sufficient acquaintance with the characters as they were in life to appreciate the force, tact, and humor of the author's presentation. The ordinary reader was repelled from the book by the quantity of names and things utterly unknown to him. Even when his curiosity was roused, he could not easily satisfy it, because, in the lack of all those aids in the shape of innumerable dictionaries that the student of the ancients has, the beginner in Renaissance studies finds himself helpless the moment he leaves the broad highway hedged with glittering generalities. A well-annotated edition of the 'Cortegiano' was, therefore, much wanted, and nothing could satisfy the want better than that of Signor Vittorio Cian, published a few months ago at Florence by G. C. Sansoni. Signor Cian is a well-known specialist on the subject of Castiglione, an edition of whose unpublished letters he is now preparing. He has prefixed to the text a biographical dictionary of all the interlocutors. The notes are copious, and although many are of a philological nature, most are explanatory and interpretative, no allusion being left unnoticed, no point not cleared up. To the be-

ginner Signor Cian's 'Cortegiano' is indispensable; to others it makes a delightful classic many times more delightful.

—Another but little less recent book, which plunges the reader into the very midst of the Urbino "Salon," is 'Mantova ed Urbino, Isabella d'Este ed Elisabetta Gonzaga nelle relazioni famigliari e nelle vicende politiche,' by those ripe and cultured scholars, Alessandro Luzio and Rodolfo Renier (Turin: L. Roux). A book of this kind, in which people of the Renaissance are made to describe themselves, to reveal their passions, interests, and foibles, to explain their relations to one another—a book in which the author never enters except to introduce a useful date or an illuminating note—is an untold relief after the cartloads of rubbish that have appeared in recent years about the Renaissance in the abstract, written frequently by people with a bare smattering of Italian and next to no acquaintance with Italy. The personality that stands out clearest in this model work is that of Isabella d'Este, the brilliant Marchioness of Mantua. She anticipates not only the French *marquise* of the last century, but even more our American great ladies. We see her devoted to horseback riding as well as to diplomacy. A new hair wash or receipt for the complexion interests her no more than a fresh sonnet or the last good story. She was as devoted to travel as many of our countrywomen, and, like some of them, she seemed happier and more herself without her husband. A winter in Rome to her was like a winter in Paris in our days, and in the Rome of Leo X. Isabella d'Este found no lack of excitement and amusement, and of course she received the homage of all the wits and men of fashion. Art was perhaps the greatest of her passions. She was among the first to appreciate Michelangelo. Mantegna, the Bellini, Perugino, Costa, and Titian painted pictures for her cabinet, and it is due to her influence that Mantua became what it did, the model of a European court—one that Louis XIV. could not help imitating to the minutest details.

## THE END OF EMIN PASHA.

*Mit Emin Pascha ins Herz von Afrika:* Ein Reisebericht mit Beiträgen von Dr. Emin Pascha, in seinem Auftrage geschildert von Dr. Franz Stuhlmann. Im amtlichen Auftrage der Kolonial-Abtheilung des Auswärtigen Amtes herausgegeben. Karten, Portraits, etc. Berlin: D. Reimer. 1894. 8vo, pp. xxi, 901.

The last expedition of Emin Pasha was rarely fortunate in its historian. An unusual combination of qualities, thorough scientific training, literary skill, keen powers of observation, and a kindly interest in everything human, has enabled Dr. Franz Stuhlmann to write one of the best books on Africa of which we have any knowledge. Few travellers have pictured more vividly than he the incidents of the journey, the distinctive characteristics of the regions traversed. None have surpassed him in the scrupulous fidelity with which he has described the various customs, habits of life, appearance, etc., of each native tribe which he encountered. It is this painstaking and picturesque collection of ethnographic facts about a race which is fast disappearing or transforming before the inrush of a new civilization—not the importance of the expedition, for that accomplished little or nothing worthy of note and ended in disaster—which gives the work its great value. The connection of Emin Pasha with the expedition adds, of course, vastly to the interest of the account, though scarcely anything to its intrinsic worth. The picture which the author draws of this ill-fated man is, the reader feels, to the life. Whether it will add to his reputation as a wise organizer and leader is a matter of grave doubt. Dr. Stuhlmann, on the other hand, has shown himself to be an admirable traveller and well fitted to govern the natives. The only weakness which we have noted is an undue, though not unnatural, prejudice against the English, which is frequently manifested. The references to Stanley—mostly fragments of Emin's conversation—are amusing, though it should be added that there are only generous words of praise, both from the author and from Emin as well, for Stanley's geographical work. This is the more noteworthy as in Germany they are accustomed to "shrug their shoulders" over it.

The aim of the expedition which, a thousand strong, left Bagamoyo, opposite Zanzibar, on April 26, 1890, was in general terms to strengthen and extend the power of Germany within its sphere of influence. Emin was the leader, and Dr. Stuhlmann, who had been for two years in Africa studying its zoölogy, was taken on to aid in the scientific work. At Mpwapwa they met the notorious Dr. Carl Peters returning from his raid through Masailand and Uganda. He strongly advised Emin to make all possible haste to Lake Victoria in order "to secure the neutrality of Uganda and the Equatorial Province," or, in other words, to thwart the supposed designs of England in these regions. This advice was followed, as well as Dr. Peters's method of treating hostile natives. To punish attacks upon the expedition, whether provoked or unprovoked does not appear, Emin burned villages—for one offence nineteen—killing and wounding the inhabitants and looting their cattle. In this way the Germans too frequently assert their authority in their African territory, with the natural result that it is being turned into a wilderness. On reaching the lake, Dr. Stuhlmann was sent to destroy the station of an Arab slave-trader—a more laudable act, though one which Capt. Lugard believes to have led to Emin's murder two years later. After the founding of the station of Bukoba on the west shore, the doctor went to Uganda, ostensibly to buy boats, but in reality to watch the course of events with the intent of gaining some advantage for Germany. This can hardly be regarded in any other light than a discourteous act to the English, whose agent, Capt. Lugard, was at that moment endeavoring to come to an understanding with the king and his chiefs. The German's presence must have made his task more difficult, as during these negotiations Mwanga actually offered to place himself under German protection and to hoist the German flag. Though this offer was declined, blood-brotherhood was made between the king and Emin's representative, who soon after returned to Bukoba. Advantage is taken of this episode to give an interesting account of Uganda, its people and their history.

Disappointed in his hopes of extending German influence in this direction through the Anglo-German agreement giving the sole control of Uganda to the former power, the Pasha now turned his whole attention to his former province, and first to his Sudanese, who were still where Stanley and he had left them two years before on the western shore of Lake Albert. "He hoped, if he could reach his people, to join forces with them, in order, if circumstances permitted, with their aid to make his way through Monbuttu westward, and, if possible, to take possession of the Hinterland of the Cameroons." In carrying out this plan, as indeed in almost all his proceedings after leaving Mpwapwa, though Dr. Stuhlmann is not perfectly clear on this point, Emin did not have the sanction or approval of the Government, nor of his companion, who regarded this plan as "magnificent" but impracticable. Stuhlmann's advice was to explore the little-known region between Lakes Tanganyika and Victoria, the original object of the expedition. But Emin obstinately refused to listen to him, and they started, though with greatly reduced numbers, for Lake Albert. The route was very nearly the same that Emin had travelled before with Stanley. On the way Dr. Stuhlmann made an unsuccessful attempt to climb Mount Ruwenzori, not being able to reach the snow-line. On July 21, 1891, the lake was reached, and negotiations with Selim Bey, the commander of the Sudanese, began at once. They were unsuccessful, though a considerable number of Selim's people, mostly men incapable of bearing either arms or burdens, with their families, joined the Pasha. After three weeks' delay they started again, the expedition now consisting of 320 persons, 96 of whom were women and 39 children. It was the height of folly with such a force, and lacking ammunition, food, and supplies, to attempt to cross the forest in which Stanley's perfectly equipped expedition had nearly perished. It is hard to acquit Dr. Stuhlmann of great blame in not compelling Emin to give up his mad project. He says that he remonstrated with him, and Emin's only answer was the permission to go back if he chose. The Pasha himself was determined to press forward "into uncertainty and danger, only in order to be useful to his fatherland, and to show the world that he also alone, without Stanley's help, could lead an expedition." In these naïve words of the author we find the ruling motive of Emin's conduct—intense jealousy of his rescuer. For this he was willing to sacrifice what was probably of more value to him than his life—the opportunity to give to the world the results of his scientific labors, so zealously and successfully pursued through many years.

The next three months were spent in vain efforts to push through the forest, first to the west and then to the north, but Emin was continually baffled by the feebleness of his force and the want of food and guides. The story of these last days is perhaps the most pitiful in all the annals of African travel. Emin had become nearly blind, and, through sickness and privation, reduced almost to helplessness. Yet he struggled on with a persistence, partly heroic, partly despairing, unwilling to acknowledge defeat, though his enemies were not men, but disease, hunger, and the forest. At length he was compelled to return to his former camp by the lake, where, to add to his misfortunes, smallpox broke out among his people. After vainly endeavoring to stamp it out, he separated the well from the sick, and ordered Dr. Stuhlmann to lead the former back to the German station on Lake Victoria, promising speedily to follow him. On the 10th of December, 1891, they parted, Emin's last words being, "We will hope to meet again in a month! If, prevented by force, I should not come, then think of my child!" It was with great reluctance that Dr. Stuhlmann left his leader under such circumstances. "Many times during those wearisome days," he writes, "the thought darted into my head to seize the command of the

expedition and to carry him forcibly to the coast. But, apart from all other scruples, I should have had to risk his doing himself an injury." The rest of the melancholy story is soon told. Three months later letters—the last dated January 12, 1892—were received from Emin at Bukoba. From these and the report of the bearer, it appeared that, though the Pasha's health had improved, the smallpox had spread to the natives, many of whom had died and the rest had fled, so that it was impossible for him to march. There were with him at this time twenty-two men, "besides many women and children." Again the closing words were a greeting to his little daughter Ferida. His diary, which the Belgians recovered from the Arabs, records that he remained in this camp until March 9, when he left in company with a party of Manyema slave-hunters who were returning to their home on the Congo. Dr. Stuhlmann thinks that he was compelled to take this course, starvation being the alternative. He safely crossed the great forest in a southwesterly direction, and was within a few days' march of the river when he was murdered, on October 20, by the leader of the band. The remainder of the expedition, it may be said here, under the lead of his companion, reached the coast in July without any noteworthy incident.

In this work Emin Pasha is invariably treated with the deference due to a superior officer and a distinguished man of science. Possibly more than justice is done to his powers as a leader, his patience and tact in dealing with the natives, but not too much to his tireless zeal in the pursuit of knowledge, his forgetfulness of self in the thoughtful care for his companions, his far-reaching views and ambitious aims. At the same time the picture is not one-sided. It is evident that Emin was capricious, irritable, not always sincere, jealous and invincibly obstinate in attempting to carry out even hopeless plans when once he had formed them. It was to this trait mainly that the final catastrophe was due. The general impression left, however, is of a man of more than ordinary interest and one peculiarly adapted to the rôle of an African explorer. In respect to the charge made against Emin that he turned Mohammedan, Dr. Stuhlmann writes: "He did, it is true, in his province outwardly observe the Mohammedan customs, but at heart he remained a good Protestant. When during our travels our tents stood close together, I could hear frequently in the evening how, before he retired, he prayed for a long time in the Protestant way."

Three of the chapters of this work were written from his dictation—accounts of the events in his province after his departure and of the negotiations with the Sudanese, and a valuable description of the A-lur, a negro tribe dwelling on the upper Nile. The latter is a good specimen of the immense stores of information which he had gathered, much of which probably perished with him. In the similar descriptions of the different tribes which were encountered by the expedition, and which form a considerable part of this volume (the other scientific results are to be published separately), Dr. Stuhlmann shows how much he has profited by his leader's instructions and example. They are models ot simplicity and of careful detail, while the numerous illustrations of dwellings, tribal markings, weapons, and household utensils render them unusually intelligible. The chapter on the Pygmies, of whom the expedition saw a considerable number, at one place finding a settlement of between one and two hundred huts, is a monograph of peculiar interest and value. From numerous measurements our author found their height varied from 1.24 metres to 1.50 metres, though Emin held that all above 1.40 metres were of a mixed race. That they are not misshapen, the admirable photographs of the two women who joined the expedition clearly prove, nor do they show less intelligence than the average negro, though they have no knowledge of making fire by stick-rubbing. A down-like hair, two to three millimetres long, which looks in the distance like silk, covered the whole body, which was without ornament. Their language, when talking together, was like the twittering of birds. Stuhlmann saw no evidences of the cannibalism with which some writers have charged them, and is inclined to believe that they are the autochthons of Africa and of the same race with the Bushmen.

Among the negroes whom Dr. Stuhlmann describes, there is one, familiar to the readers of Stanley's latest books, who stands out pre-eminent, Uledi, the Zanzibari porter. He accompanied the great explorer in his last two expeditions across the continent, during which, according to Stanley, "on thirteen occasions he saved human life," and "at the call of duty he was ever the foremost." Of this expedition he was also the mainstay, the one always to be relied upon in times of difficulty and danger. Tactful and kindly in dealing with his fellows, ignorant of fear, "the faithful Uledi," as Stanley calls him, "the admirable (*trefflich*)" in Dr. Stuhlmann's parting term, is probably the very flower of his race.

Mention has already been made of the numerous illustrations by which the value of this work is greatly enhanced. Among them are copies of photographs of scenery and the vegetation, especially of the forest, and excellent portraits of the leaders and some of the more noted natives, as Uledi and the murderer of the Pasha. There are also two admirable maps, one showing the route, the other, ethnographical, showing not only the present dwelling-places of the various races, but their lines of migration, with insets indicating the geology, the comparative density of population, and the agriculture of eastern equatorial Africa. In every respect of excellence in typography and general make-up, this splendid volume is an honor to the German Colonial Government which authorized and aided in its publication. Their policy of giving to the world in such a perfect form the results of the labors of their officials is one which it would be well for England more frequently to imitate.

---

*Cock Lane and Common Sense.* By Andrew Lang. Longmans, Green & Co. 1894. xvi, 357 pp., 8vo.

Under "Cock Lane" in this title Mr. Lang refers to what are ordinarily termed "spiritualistic manifestations," ghosts, telepathy, *et id omne genus;* and under "common sense" he seems to include everything ranging from flippant scepticism to philosophical caution in accepting results which appear to violate recognized physical laws. In the preface he avows that he is not conscious of any bias in favor of common sense—a statement which is fully upheld by the subsequent text. The innocent reader, misled by the ostensible seriousness of the preface, will be apt to suppose that the collection of clever essays which follows is intended to be taken seriously. Occasionally it would seem as if Mr. Lang was sufficiently carried away by his subject to be momentarily serious in spite of the adroitly veiled sarcasm which characterizes the bulk of the book, and which soon convinces the careful reader that the author is quietly laughing in his sleeve at the absurdities which he chronicles and discusses.

The book is neither an advocate of the reality of the marvellous nor a consolation for the sceptic. Scientific treatment is explicitly disavowed at the outset, with the implication that, as an amateur, the author's opinion on such points is "of less than no value." But he does not hesitate to characterize modern spiritualism as "for the most part an organized and fraudulent copy of the old popular phenomena, with a few cheap and vulgar variations on the theme." On the other hand, he frequently pauses to deprecate the unwillingness of people who have "a bias in favor of common sense" to spend their time investigating matters which, in their nature, are incapable of exact analysis, and of which the outcome would leave both parties thinking as before. Absolutely destitute of any scientific spirit, the book has spirits of other sorts in abundance whose pranks are amusingly detailed. After a lengthy introduction follow chapters on Savage and on Ancient Spiritualism; Comparative Psychical Research; Haunted Houses; Cock Lane; Apparitions, Ghosts, and Hallucinations; Crystal Gazing; Second Sight; Ghosts before the Law; A Modern Trial for Witchcraft; Presbyterian Ghost Hunters; The Logic of Table-turning; and the Ghost Theory of the Origin of Religions. Lovers of the marvellous, which includes practically all mankind, will find here plenty of it, not obtrusively discredited. The anthropologist may gather items for his studies, the sceptic may enjoy the evidences of the weakness of the human intellect and the perennial credulity of the multitude; he alone who seeks for the author's conclusions will be disappointed. When all is said and done, like the balls of the Indian juggler, behold! they have vanished into the blue above.

There is no index, which is to be regretted, for the text is a mine of disconnected facts difficult to refer to. Four of the essays in the main have been previously printed, but have been recast and extended for the present volume.

---

*Romantic Professions, and Other Papers.* By W. P. James. Macmillan & Co.

Mr. James's volume assures us that speculation on unconsidered trifles is not a wholly idle exercise and that it is even a source of pleasure and profit, if only the trifles be judiciously selected. Almost every one has noticed the limitations of profession and occupation prescribed for the hero of romance; the fitness or unfitness between names and characters in novels; the insistence on youth as a requisite for exciting romantic interest; but few have stopped to inquire into the justice of accepted premises, or to look about for a possible philosophical basis. Mr. James does both, in a desultory fashion, without much attention to sequence of ideas and with no pretension to subtlety, yet with enough originality and fulness of illustrative reference to give his apparently frivolous themes an air of considerable gravity and importance. Here and there he ventures a declaration of literary faith, and a collocation of his stray dicta makes a wholesome creed, perfectly intelligible to simple souls wandering benighted in the fog of professional declamation about the meaning and mystery and mission of art. In the paper entitled "The Nemesis of Sentimentalism,"

which is really a criticism of Flaubert's 'Mme. Bovary,' and, with the exception of Mr. Henry James's, the best that we know in English, he takes occasion to say, apropos of Flaubert's careful observation of life:

"Art, ideal as it necessarily is, cannot do without observation, but its kingdom cometh not with observation alone. It penetrates to the spirit and reveals the significance of the things observed. 'Mme. Bovary' is art by its intensity of vision, by its inevitableness, by its style."

Then, in reference to a wholly irrelevant incident in 'Anna Karénina,' much commended by Matthew Arnold as a piece of life itself, Mr. James utters what ought to be a self-evident proposition, but unfortunately is not:

"Between life and a book there must always remain a great gulf fixed. To merely copy in art the apparently meaningless, anomalous, or unintelligible things of life, on the plea that such things do actually exist, is to mistake the whole aim and scope of art."

Equally mistaken is literal transcription of the dulness and humdrum of life, and we could wish that our host of aspiring realistic novelists would take to heart Mr. James's remarks thereon. His occasional thrusts at anatomy and physiology in fiction are also creditable to his feeling for art and his common sense. On the unimportance of accuracy in historical novels when compared with interesting story and dramatic passion (that is, in behalf of Scott and Dumas), he speaks with a courage that nowadays is quite foolhardy, and we share his melancholy foreseeing of the time when "we shall all eat of the tree of knowledge, and be as professors of history, knowing fact from fancy."

For form and clever tossing of thought, the last paper, "The Great Work," is the best. Mr. James is demonstrating that no urging from without ever makes a man produce a *magnum opus*, but, on the contrary, frequently hinders him from doing the good work easily within his scope. As a final instance he cites 'Amiel' in a passage worth quoting because it is spoken in flagrant contempt of many outpourings of refined literary sentiment:

"The typical martyr was the unhappy Amiel. Had not his friends insisted upon his regarding himself as a genius, he might have lived a prosperous life as a Swiss gentleman and father of a family, doing his duty in that state of life in which it had pleased God to call him as a lecturer to ladies. But once he got into his head that he was a genius from whom great things were expected, his life thenceforth was the life of the impotent man longing, yet powerless, to struggle down into the troubled waters of literary production into which others continually plunged before his eyes. So he maundered into a *journal intime*. When people talk of the slavery of journalism, at least let it be confessed that it is better to be the slave of any respectable public journal than the slave of a *journal intime*."

This is not all Gospel truth, but may well give the undiscriminating adorers of Amiel pause.

---

*Studies in Oriental Social Life*, and Gleams from the East on the Sacred Page. By H. Clay Trumbull. Philadelphia: John D. Wattles & Co. 1894.

In reading Mr. Trumbull's studies in Oriental life we are reminded of restorers of antiques at Rome. Some of these artists are well-nigh creators or resurrectionists. Give them a well-preserved Roman nose, and, under their manipulation, it will swell up into the fair proportions of a classic bust or even statue. Some years before the British occupation of Egypt in 1881, Mr. Trumbull spent a week in Jerusalem, and a little time north of that city, with perhaps a month in journeying thither from Alexandria by way of Mount Sinai. These weeks in sacred lands have given birth at last to an octavo almost too ponderous to be accepted as mailable matter. The genesis and exodus of the work are noteworthy.

Certain phases of life as Mr. Trumbull saw them on his brief tour gave direction to his after reading, both sacred and secular. Much of the Bible seemed to him either illustrated by his observations in the transient pilgrimage or illustrative of them. More than seven hundred texts of this sort, scattered through fifty-two books, are referred to in his text, and are marshalled in an index of fifteen columns. Then, at least fifty-two other volumes are cited as authorities, though often, as it happens, for proving what nobody disputes, or what nobody cares to see proved. Readers will feel that the secret of being dull is to say everything, and that twice.

One of Mr. Trumbull's chapters is "Hospitality in the East." The only provocation for this dissertation of seventy pages was a cup of coffee given him near Jezreel by a sheikh whose "house of hair" he passed by, and for which no payment, as he supposed, would have been accepted. In most cases of this sort, while chiefs would disdain personal remuneration as Elijah did the silver of Naaman, their underling Gehazis are ready to grasp, or even demand, such returns; and, so far from being cursed, like Gehazi, find their masters eager for a share of their gains. In the outset Mr. Trumbull declared that "in the East hospitality has a preëminence in its obligations and in its significance not recognized to the same extent elsewhere in the world." But the latter end of his treatise on hospitality forgets its beginning. The virtue at first claimed as the exclusive prerogative of Orientals shows itself as Occidental also. It appears "in its highest form—as superior to the demands of personal vengeance or of religious prejudices—in the traditions of the Irish people" (p. 122), and in Tripoli (p. 118). More than this; besides that the duty of hospitality was a religious obligation among the Romans, to whom we owe the word itself, we are told that "its claims among the American Indians are recognized in much the same manner as among the Orientals" (p. 138). Mr. Trumbull's philosophy would make hospitality a matter of longitude; his facts show that it marks a certain stage of culture, or, according to his quotation from Bruce, "that it is the virtue of barbarians, who are hospitable in the ratio that they are barbarous," etc. The sheikh who prepared coffee for Mr. Trumbull, having come from beyond Jordan, had probably never before encountered a Yankee party, and was impelled by a natural curiosity to make the most of the interview. His cordiality seemed the greater to Mr. Trumbull, who was ready to believe his sentimental ideal of hospitality realized. But one wonders how such an ideal could have survived certain shocks to which it was subjected. Thus, our traveller had a written contract with his dragoman in which it was agreed that a certain sum should pay all expenses, including every variety of gratuity to everybody. But we find the dragoman, who was wealthy, begging a baksheesh, and that in the shape of Mr. Trumbull's valise. When promised that such a gift should be sent him from America, the beggar, through a go-between, made it known that he would much prefer the value of the valise in hard cash at once. When this sum was paid him, he still begged that an additional baksheesh might be sent him from America. What spirit of hospitality can coexist with such meanness? A hundred Oriental wayfarers have been assailed by extortioners importunate for more than they had agreed to receive, where a single one has tasted a hospitality amounting to so much as a cigar—a gift not unknown from the entirest stranger among Occidentals. *Experto crede Roberto.*

Mr. Trumbull gives us a taste of his quality as a Biblical critic in his remarks on the spoiling of the Egyptians by the Israelites when those slaves left their masters. In his judgment the gold and silver thus obtained (which sufficed, among other uses, for casting the golden calf, and also adorning the Tabernacle till it might be termed a golden house) should be deemed analogous to the tips that are paid to Pullman porters, or the baksheesh which he paid his Oriental servitors—"tokens of friendship and proofs of faithful service." Mr. Trumbull tells us that during our great war he was a prisoner at the South, and he may himself have known Old Shady, who sings, "Good-bye, Massa Davis, good-bye, Massa Stevens, 'scuse dis nigger for takin' his leavins'"; but did he ever hear of a dusky runaway who added insult to injury by appealing to his master to defray the expenses of his journey North? Throughout, our author, while his faith in miracles is strong, is full of theories which make them appear superfluous, and which seem more improbable than the miracles themselves. His make of mind appears to be that of those post-Homeric poets who on the one hand tell us that Achilles, by being dipped in the Styx, became invulnerable, and on the other never let him show himself on the battle-field till he is clad all over in armor of proof.

---

*Congregationalists in America:* A Popular History of their Origin, Belief, Polity, Growth, and Work. By Rev. Albert E. Dunning, D.D. Special Chapters by Rev. Joseph E. Roy, D.D., on Congregational Work and Progress in the West and Northwest; Rev. Francis E. Clark, D.D., on Congregationalists and their Young People; Rev. Howard A. Bridgman, on Congregational Literature; and Rev. Alonzo H. Quint, D.D., on Ecclesiastical Councils. Introductions by Rev. Richard S. Storrs, D.D., LL.D., and Major-General Oliver O. Howard, LL.D. New York: J. A. Hill & Co. [1894.] Pp. 552.

This lengthy title indicates the character of the volume under review. It is designed to present the story of the religious body of which it treats to the general reading public, and especially to the members of the denomination from which it takes its title, rather than to students of New England history. In furtherance of this popular intent it has aimed to secure the weight of names honored for one cause or another in the communion to which it distinctly appeals, by its double introductions and supplementary chapters; but the essential portion of the volume is the work of the Rev. A. E. Dunning, editor of the Boston *Congregationalist*. In his chapters the principal writer has told the story of American Congregationalism in a pleasant way that will make the work not without value to the average intelligent reader for whom it is designed; and as Dr. Dunning seems more at home as he approaches his own age, his chapters grow in strength and worth as the volume advances.

It could be wished, however, in spite of the principal author's declaration that he has "not allowed" himself "to take the space or to burden the pages with references in detail to authori-

ties," that he had made greater acknowledgment than a mere mention of their names and works in a "List of Authorities" of his indebtedness to other writers on New England and Congregational history whose ideas and language he has liberally reproduced. Nor is the work without evidence of careless writing and proof-reading, as illustrated, for instance, in the citation of a 'History of Connecticut' by "J. Hammond Trumbull" (instead of Benjamin Trumbull) in the "List of Authorities"; in the statement that the much-discussed ballot at the choice of Higginson and Skelton at Salem in 1629 was a "printed ballot" (p. 104); the implication (p. 156) that the New Haven Church and court were formed in 1638 instead of 1639; the assignment of Gilbert Tennent's farewell sermon at Boston to 1841, and of the opening of Andover Seminary to 1708 (pp. 251, 387, doubtless slips of the proof-reader); the declaration that "the first treatise against Trinitarian doctrines written by an American was published" in 1803 (p. 290); the transfer of the name of the Baptist divine, George Dana Boardman, to the *emeritus* theological professor of Chicago Seminary, George Nye Boardman (p. 389); or the representation that Horace Bushnell was an occupant of "the pulpit of the First Church, Hartford, Conn." (p. 395)—a church that always opposed Bushnell during his active ministry.

More important, but none the less open to serious criticism, are the statements that the "Great Awakening" with which the names of Whitefield and Edwards are associated, "may almost be said to have created in this country those nobler sentiments of humanity, one fruit of which, after a century, was the overthrow of slavery" (p. 261); and that "a candid study of the early history of New England can lead to no other conclusion than this, that the most powerful motive in originating the war of independence was a religious motive" (p. 265). It could also be wished that an apparent desire to avoid controverted problems had not led Dr. Dunning to speak with uncertain voice on such questions as the circumstances of the formation of the Salem church, the extent of the indebtedness of the New England Puritans to the Pilgrims for their ecclesiastical polity, or the witchcraft excitement, and also designedly to omit any consideration of that which has been most interesting in the modern history of Congregationalism—the debates which have turmoiled the sessions of the "American Board" and perplexed the authorities of Andover Seminary.

*A System of Legal Medicine.* By Allan McLane Hamilton, M.D., and Lawrence Godkin. Illustrated. Volume I., pp. 657. New York: E. B. Treat. 1894.

Law touches the profession of physic in almost every phase, so that the individual, from the rôle of murderer or victim to the other end of the scale as the client of an insurance company, falls within the range of the newer science known as legal medicine. As law has the organized machinery of society at its disposal, and as medicine is chiefly occupied with individuals in their personal relations, the former moulds the action of the latter when they come together, except on the rare occasions when the facts of the laboratory withstand the theories of the bench. But, after all, the bench usually wins, and it is less a conflict than a rivalry of methods in attaining the truth. The literature of medical jurisprudence is voluminous. The most valuable part is within the present century, and the bulk of it is of Continental origin. The earlier details are more curious than edifying, for the law no longer takes cognizance of witches, and the science of the past becomes obsolete under the advance of exact methods of investigation. For the purposes of our own people the bearing of the principles of medicine and of natural science upon the law, and especially upon statute law, or, more correctly, the coloring that the law applies to them, must be of British and American origin. The first modern work of importance was the 'Questiones Medico-legales' of Zacchia (1621), followed by more than a score of German works, beginning with Alberti Halle (1739) in the next, and by twice as many in the nineteenth century. The French gave out two dozen, the European peninsulas as many more, and the outlying countries another dozen. These figures refer only to works of importance in this century. The leaders on the Continent were Louis, Orfila, Casper, and Tardieu. Ogston, Tidy, Guy, Christison, and Taylor were the British authors; the 'Manual' of the latter running for forty years from 1844 through numerous editions, and being very popular with American students. At home, Beck, Reese, and Wharton, and Stillé in the general subject, and the unrivalled Wormley in the micro-chemistry of poisons, have held the field. Each of these books was the product of one or, at the most, of two minds. For those who read Japanese, 'Saiban Igaku Teiko' (Tokio, 1822) is interesting as showing the relations of the two sciences in the Empire of the Rising Sun while it was yet free from Western, except Dutch, influence.

The 'System' under review is the result of collaboration, often employed in general medicine, but not previously in this specialty, and the coworkers are of both professions. Naturally, perhaps necessarily, some of the topics overlap. The material presented is so enormous that it is impossible to discuss it in detail. Of the essays proper, that on the "Identity of the Living" is probably the least satisfactory. The long essays on death and on homicide and wounds by Dr. Francis A. Harris and Dr. Lewis Balch are the most important in connection with the ordinary demands of a coroner and of a criminal jury; and in the former of these the method of reconstructing an unknown victim from certain dismembered fragments is curious and useful. Some of the other essays are of great value, notably that by Prof. Babcock on "Blood and Other Stains." We are glad to see it laid down that the most that can be established in relation to the measurement of blood corpuscles is that the stains are of mammalian blood, the diameters are consistent with human blood, and that they may be other blood. Prof. Vaughan's experiments demolishing the trustworthiness of Dragendorff's method for the determination of morphia in the liver and other organs are here published for the first time (we believe) in a text-book. The color tests for morphine, in the absence of its crystals, it appears, cannot be depended upon in the presence of putrefactive indol where tissue decomposing in the absence of oxygen is examined. Vaughan has also independently discovered the possible escape of arsenic as gas, an observation made long ago by Hünefeld, but not practically developed.

Here and there reference is made to left-handedness in the probable assailant; but in the stress properly laid upon careful observation of the body and of the other inanimate surroundings, this particular indication might be more emphasized. Because so few people are left-handed, a very good clue is afforded when a sinistral sign is discovered. It once occurred to the writer to express the opinion that a fatal blow over the eye had been made by a moderately obtuse weapon of small size probably wielded by a left-handed man. Subsequently it appeared that the man who had the best opportunity to offer the violence was left-handed, and was in the habit of carrying his pistol by the barrel, and of making back-handed blows with it. There was little moral doubt that the murder was committed by this man striking the other a lateral blow with the hammer of his pistol as he walked with him on his right. The medico-legal aspects of self-cocking pistols, by the way, are overlooked. A man's body was found lying on the back in bed with a pistol wound behind the right ear, and a self-cocking revolver, with two chambers exploded, firmly grasped in the right hand, which was extended along the right thigh. The second bullet was found in the ceiling a trifle to the front of a vertical line from the centre of the body. It was a question whether the bullet in the ceiling was a trial shot, or whether it was due to pressure on the trigger as the arm was extended automatically. It probably was the latter, but had a second person been in the line of fire it might be thought that there was murder as well as suicide. Numerous variations of this complication are possible.

Dr. Harris believes that cadaveric spasm occurs, and cites Ogston as having witnessed eleven cases. There is no question as to its occurrence, and death by gunshot is its most common antecedent. Doubtless every active campaign furnishes illustrations. Near Bristoe Station, Hooker drove back Stonewall Jackson August 26, 1862, in a sharp fight (that plays no part in Jackson's invariable victories), and the next day in a small grove a number of Confederate riflemen were still to be seen in the picturesque attitudes of firing in different postures as death overtook them. Groups of such subjects are not common, but they have occurred.

The short but interesting essay of the legal editor cites with approval the Leeds method of doing away with the scandal of medical experts appearing for or against a prisoner. By it all the medical witnesses freely confer with each other before the trial; and thus the whole truth comes out, usually without cross-examination and always without the suspicion of prejudice. As he properly remarks, this method requires a high degree of intelligence and honor in the witnesses themselves, but it certainly is an attainable standard.

In one or two of the articles, notably by members of the bar, there is a levity of style hardly compatible with so serious a subject; and among the medical writers the somewhat common error of the factitious *calvarium* (which also has crept without authority into a standard dictionary) for *calvaria* (fem. sing.) should have been corrected by the editor, if not by the proof-reader.

This great volume might be the basis of almost endless comment, but there are limits we may not pass, and then we are deprived of the assistance of an index, which will probably be supplied in the second volume, though, where the bulk is so great, we think a separate index should have been furnished, even if it had to be repeated in the general.

---

*The Lover's Lexicon.* By Frederick Greenwood. Macmillan & Co.

No benefactors of the human race have commanded so little love as the makers of diction-

aries. In the present, when a dictionary represents the work of scores of scholars, they, of course, cannot be loved any more than another soulless corporation; but in the past, who among us ever cast a crumb of affection to Johnson, or Larousse, or Noah Webster, because of their years of patient toil in our behalf? When we consider the dreadful doubts that have been set at rest, the angry passions that have been soothed, the apparently interminable discussions that have been cut short by recourse to dictionaries, such indifference to their makers is an appalling example of thankless ingratitude. The only exception to this universal heartlessness we can think of is found in Boston, where Worcester occasionally excites a sentiment akin to worship when he happens to give a Bostonian pronunciation without the fatal abbreviation *Amer.* If we have not emphasized the rarity of a dictionary which compels love for the author, the foregoing remarks may be taken as a wanton slander on our kind, and the connection with 'The Lover's Lexicon' will be completely missed. The qualities that make us love any man through his book are tenderness, generosity, and kindly humor, and the constant though not obtrusive presence of that wisdom which is born partly of experience, but more largely of intuitive perception of the secrets of the heart. Such gracious presences flit about and fill the pages of 'The Lover's Lexicon,' and it is the *embarras de richesses* only which prevents our making the assertion good by quotations. On the title-page Mr. Greenwood enumerates the classes to whom his "hand-book" is particularly addressed, and to these we add, all lovers of good literature, all who would fain forget for a while our natural depravity, and linger willingly on our less conspicuous inheritance of faithfulness, tenderness, naïveté, and even innocent absurdity.

BOOKS OF THE WEEK.

Bangs, J. K. The Water Ghost, and Others. Harpers. $1.25.
Crockett, S. R. Mad Sir Uchtred of the Hill. Macmillan. $1.25.
Dumas, A. The Conspirators. M. J. Ivers & Co. 25 cents.
Evetts, B. T. A. New Light on the Bible and the Holy Land. Cassell. $3.
Following the Star. Philadelphia: American Sunday School Union. 90 cents.
General Catalogue of Bowdoin College, including an Historical Sketch of the Institution during its First Century. Boston: W. B. Clarke & Co. $1.
Hawthorne, Hildegarde. The Fairest of the Fair. Philadelphia: Henry Altemus. $1.25.
Hunt, E. Geometry for Grammar Schools. Boston: D. C. Heath & Co.
Hunt, Violet. The Maiden's Progress: A Novel in Dialogue. Harpers. $1.
Janvier, T. A. In Old New York. Harpers. $1.75.
Jones, Sarah J. Godfrey Brenz. Philadelphia: American Sunday School Union. 80 cents.
Kendall, May. Songs from Dreamland. Longmans, Green & Co. $1.75.

Munroe-Ferguson, V. Music Hath Charms. Harpers.
Oriental Studies: Papers Read before the Oriental Club of Philadelphia. Boston: Ginn & Co. $2.
Piatt, Sarah. Poems. 2 vols. Longmans, Green & Co. $3.50.
Pool, Miss Maria L. Out of Step. Harpers. $1.25.
Rollins, F. W. Break o' Day Tales. Boston: Joseph Knight Co. 75 cents.
Rowsell, Mary C. The Friend of the People. 3 vols. London: T. Fisher Unwin.
Scovil, Elizabeth R. The Care of Children. Philadelphia: Henry Altemus.
Sharpe, R. R. London and the Kingdom. Vol. I. Longmans, Green & Co. $3.50.
The *Overland Monthly*, January—June, 1894. San Francisco: *Overland Monthly* Publishing Co.
The Silver Christ. By Ouida. Macmillan. $1.25.
Tomlinson, E. T. The Search for Andrew Field. Boston: Lee & Shepard. $1.50.
Unwin, Prof. W. C. The Development and Transmission of Power from Central Stations. Longmans, Green & Co. $3.50.
Younghusband, Capt. G. J. On Short Leave to Japan. London: Sampson Low & Co.
Woolcombe, W. G. Practical Work in General Physics. Oxford: Clarendon Press; New York: Macmillan.
Warden, Florence. A Perfect Fool. International News Co. 50 cents.
Warren, Prof. W. H. Engineering Construction in Iron, Steel and Timber. Longmans, Green & Co. $5.

# RECENTLY PUBLISHED.

**Bumpus's (H. C.) Laboratory Course** IN INVERTEBRATE ZOOLOGY. Revised. 157 pp., 12mo. Teachers' price, $1.00; postage, 8 cents.

Directs the work of students, without telling them everything. It brings into use a number of easily obtainable types not heretofore treated in laboratory guides.

**Hall's (E. H.) Elementary Lessons** IN PHYSICS. Mechanics (including Hydrostatics) and Light. 120 pp. 12mo.

Represents the Cambridge (Mass.) course in physics for grammar schools.

**Woodhull's (J. F.) First Course in** SCIENCE. In two companion-volumes. *I. Book of Experiments.* 79 pp. 8vo. Paper. Teachers' price, 50 cents; postage, 5 cents. *II. Text-Book.* 133 pp. 12mo. Cloth. Teachers' price, 65 cents; postage, 5 cents. Suitable for grammar schools. All experiments can be performed on the pupil's own desk, without darkening the room. The necessary apparatus costs but $1.50 for each pupil, and most of it is in the nature of a permanent equipment. The experiments are confined to the subject of Light.

**Zimmermann's Botanical Micro-** TECHNIQUE. Translated by J. E. HUMPHREY. 296 pp. 8vo. Teachers' price, $2.50; postage, 15 cents.

A hand-book of methods for the preparation, staining, and microscopical investigation of vegetable tissues and products. Its directions are very explicit.

"The work will undoubtedly meet a general need among students of botany."—*Prof. C. O. Whitman of the University of Chicago.*

**Aikins's (H. A.): The Philosophy of** HUME. As contained in extracts from the First Book and the First and Second Sections of the Third Part of the Second Book of the "Treatise of Human Nature." Selected, with an Introduction. 176 pp. 12mo. Teachers' price, $1.00; postage, 12 cents.

**Baldwin's (J. M.) Elements of** PSYCHOLOGY. 372 pp. 12mo. Teachers' price, $1.50; postage, 11 cents.

"We regard it on the whole as the best elementary text-book on psychology now before the public. It is written from the scientific standpoint, and in a thoroughly scientific spirit."—*Prof. G. M. Duncan, of Yale University.*

**Falckenberg's History of Modern** PHILOSOPHY. Translated, with the author's co-operation, by A. C. ARMSTRONG. 655 pp. 8vo. Teachers' price, $3.50; postage, 25 cents.

"The book, it seems to me, is one of the best histories of philosophy in existence. Certainly there is no other work at present in English so well adapted for class-room purposes."—*Prof. J. E. Creighton of Cornell University.*

**Duruy's History of Modern Times.** From the Fall of Constantinople to the French Revolution. Translated from the tenth edition by E. A. Grosvenor. 575 pp. 12mo. Teachers' price, $1.60; postage, 14 cents.

"It is compact, accurate, and interesting. Its great popularity in France is fully deserved; and it is doubtful whether any other single volume on the period of which it treats can be of so much value to the student."—*Adams's Manual of Historical Literature.*

**Richardson's (F. B.) Six Months'** PREPARATION FOR CÆSAR. 130 pp. 16mo. Teachers' price, 90 cents; postage, 6 cents.

The pupil is taught to build all forms upon stems. The verb is thus learned in about half the time usually taken, and time is also saved in learning the declensions. But while the book is confined to the bare essentials of grammar, the course is a thorough one, and gives the pupil such a preparation for Cæsar as probably cannot be attained in the same time by any other method.

NEW YORK, THURSDAY, SEPTEMBER 6, 1894.

## The Week.

THE Republicans are getting a great deal of comfort out of the President's letter to Congressman Catchings and Mr. Wilson's speech. Battered and breathless as they are under the blows they and their tariff have already received, they take great delight in pointing out the purpose of the insatiate Democrats to hit them again. They tell the Trusts and tricksters who managed to keep their tariff favors by grace of Gorman & Co., that there is no "finality" about the business, and no certainty at all that the swag will not be taken away from them next winter. This is really all there is to their cry that the country is to have no "peace." Neither the President nor Mr. Wilson proposes any general overhauling of the tariff. Mr. Cleveland urges only "such modifications as will more nearly meet Democratic hopes." Mr. Wilson foreshadows "not a general engagement, . . . but a steady and resistless pressure that will take one after another of the strongholds of privilege." There is nothing in that to alarm the country, or any person or business that deserves "peace." Do the Republicans want the Sugar Trust let alone? Do they think the people would be distracted and quit manufacturing and buying and selling if legislation were set on foot at Washington next winter to force that Trust to take its hands out of the Treasury? No one will believe that who observes with what popular enthusiasm the Democratic congressional conventions all over the country are taking up that issue. The President's letter has evidently given them, what they did not have before, a platform to stand on in this fall's elections.

---

Everybody must see that there will be much greater ease and propriety in piecemeal tariff amendments next winter than ever before. The old system was one of a grand log-rolling "combine." This is what the Republicans have meant by their grave talk about interfering with the "system." Any particular duty might be an outrage and a fraud, but if it was a part of the "system," you must not touch it. In other words, if you took away one conspirator's booty, he would make a great row and insist on everybody else giving up his plunder too. But now the old "combine" has been hopelessly broken, the sugar bounty can no more lock arms with wool protected by 90 per cent. duties and the Steel-Rail Trust, and say, "Touch one of us and the whole partnership goes to pieces." The partnership *has* gone to pieces. With its own plunder taken away, it will not be in a condition to make an effective fight in behalf of some other man's plunder. There is, in fact, no reason why the excrescences of the new tariff should not be cut away one after another, with the general applause of the country, and without any of that terrible disturbance which the Republican organs now foresee. The only real disturbance is in the bosoms of the men who have bought their tariff favors as of yore, and who will not, we should think, feel any too grateful to the alarmed newspapers which are pointing them out as a shining mark for the tariff-reformer's aim.

---

In insisting upon free raw materials as of the essence of tariff reform, President Cleveland stands not only for party honesty but for hard business sense. We are already beginning to see that free wool is going to do for woollen manufactures in this country what free raw silk has done for the silk manufacture and free hides for the boot and shoe industry. The woollen manufacturers are preparing for a better business than they have known in years, and are already setting up machinery for weaving grades of cloth which never before could be made in this country on account of the prohibitory duties on the wool necessary to make them. At the same time, the price of American wool is advancing—it has gone up from 10 to 30 per cent. in some lines within the past sixty days. This is the simple business fact which is too much for the arithmetic of those who dwell in the shadow of McKinley and Tom Reed. The latter's Portland organ does not deny that the price of American wool is advancing, but asks how that fact can be reconciled with the law of demand and supply. Bless the innocent hearts of these theorists, don't they know that American wool has not been treated all these years as a part of the "supply" at all? It has been regarded as a sort of national fetish, to be baled up tenderly, and spoken of only with a patriotic quaver in the voice, and kept from defiling contact with foreign wool; but as a component part of a manufactured product it has not been considered at all. But at last the woollen manufacturers have a tariff which is actually going to enable them to make woollen goods, and the demand for raw material at once springs up and the price of wool advances all over the world. The Ohio wool-growers are likely to put uglier questions than ever to McKinley this fall. It will take all the resources of his giant intellect to explain to them how it is that, while his increased duties knocked down the price of wool, free wool instantly means money in their pockets.

---

Wanamaker leaves the Philadelphia public in no doubt as to his conviction that a tariff is a tax, and that the removal of duties lowers the prices of goods. For a number of days past he has been advertising the great "bargains" which he is enabled to offer by reason of the new law. On Tuesday, for example, he made such announcements as the following:

> "Everything that free-wool and tariff influences can do to put prices on a lower level has been much more than discounted in the handsome new dress stuffs that are crowding to the counters every day. This fifty-inch serge, for instance—black and navy blue, worth 50 cents by any measure of dress-goods value, never before heard of at less—the price is 37½ cents.
>
> "This all-wool camel's-hair serge—navy blue, black, brown, modes—only a little while ago we could barely meet the demand at 50 cents; the price is 25 cents."

The ex-postmaster-general's advertisements have attracted the attention of his former chief's home organ, and provoked an outburst of wrath. Mr. Harrison's spokesman, the editor of the Indianapolis *Journal*, even goes so far as to say:

> "In trying to make the public believe that these and other reductions named in the advertisements are due to the new tariff, Mr. Wanamaker, or his advertising agent, is guilty of disingenuousness amounting almost to lying."

But there is no occasion for anger. Even if the new tariff does make things cheaper, is it not true that "a cheap coat means a cheap man under the coat," and will not the American people rise in a body at the first opportunity against any party which thus threatens to cheapen humanity?

---

The Treasury closed its August accounts with a balance of more than $8,000,000 on the right side for the month. Thus far in the fiscal year the receipts are $17,000,000 greater than a twelvemonth ago, and the expenditures $2,000,000 less. Nearly all the improvement has come from the swollen internal revenue. That will now slacken, but the customs receipts will, in their turn, bound upward, and the chances are that the Treasury will be able permanently to chase the wolf well down Pennsylvania Avenue. We think that the Treasury and the country during the past year and a half have got all the sweet uses out of adversity that they are likely to, and will not be hurt at all now by a reasonable amount of prosperity. The signs are now most flattering for a good fall business.

---

The National Labor Commission closed its sessions at Chicago on August 30, after hearing more than a hundred witnesses,

although it will give anybody else who desires a hearing an opportunity to appear before it in Washington later. It can only make recommendations, and it is given out that it will most likely advise the creation of State boards of arbitration to settle differences between employers and employed. Apropos of this, it is interesting to note that Massachusetts has such a board, and that neither was it able to avert the present strikes in New Bedford and Fall River, nor does it seem capable of doing anything to hasten the end of the controversy, which it is disposed to leave to the operation of natural laws.

---

It is evident that those who blame Mr. Pullman on account of the recent strike and the present condition of things are moved by their feelings, and not by their reasoning powers. That the Pullman Company was building cars at less than cost when the strike took place is not denied. It is admitted, too, that the strike was ordered not on account of any present reduction of wages, but on account of a refusal to advance wages to the rate of last year, although the company could not get back a new dollar for an old one in its present work. It is said that the company had a large reserve fund and a large income derived from sleeping-car service all over the country. If that is true, it might be an argument for raising the wages of the Pullman car porters and conductors. Senator Sherman indicated that in his opinion that was the right way to get rid of the surplus. No argument for raising wages in a non-paying business can be derived from the fact that some other branch of business carried on by the same company makes a profit. Mr. Pullman has no right to make gratuities of the money of his shareholders, who are largely widows, orphans, school-teachers, and other persons of slender means. These people are not seen in any of the present dissensions, and it is accordingly assumed that Mr. Pullman ought to distribute their money in a free-and-easy way, whereas a moment's reflection will show that he is a trustee and that he has no right to take an unbusinesslike step, and that in the nature of things he must be the judge of what is businesslike and what is not. The truth is, that the feeling against Mr. Pullman is mostly personal. He carries his head too high. He does not see some people even when they are directly in his way. A man may bestow all his goods to feed the poor, yet if he does not appear to take a personal interest in them they will be very likely to hate him, and will construe all doubtful points to his disadvantage.

---

Despite the opposition of the congressional campaign committees of both parties, Republicans and Democrats in various districts continue to "fuse" with the Populists. The Republicans go into such combinations in the South, and the Democrats in the West. In the Ninth Texas District a fusion has already been arranged, and in Alabama the Republicans and Kolbites will vote together again for Congressmen in November, as they did for State officers early last month. In North Carolina the Republicans on Thursday decided, nearly six to one, for fusion, or "coöperation," as it is there called, with the Populists on the State ticket. The Democrats appear to be most thoroughly demoralized in Iowa, where they join with the Populists in several districts, and in one support Weaver, who was the Populist nominee for President in 1892. Happily there are signs that these combinations will generally be as great failures as the Kolb-Republican alliance in Alabama a few weeks ago. In most cases self-respecting Republicans and Democrats will content themselves with refusing to support the fusion candidate, but the Democrats in the district where Weaver is running are setting a good example by circulating and signing a paper announcing their open opposition, on the ground that Weaver is not a Democrat, and that his platform is directly opposed to Democratic principles. In view of the probability that the next House of Representatives will be close, it would be a terrible misfortune if the Populists should carry enough districts to hold the balance of power; and both Republicans and Democrats throughout the country should do everything in their power to encourage the decent members of their parties in standing out against "combines" wherever they are attempted.

---

In several States the duty of electing a United States Senator next winter has led to peculiar developments. In Pennsylvania a fight is made against Cameron, and candidates for the Legislature are asked to pledge themselves against his return to Washington. Camden is the offensive personality in West Virginia, and the protest against his re-election has been so strong that his defeat is said to be already assured. No election of Senator is to be had in Maryland, yet Gorman has made himself so obnoxious to the decent elements of his party in that State that they are combining against his creatures in every way possible. If he were up for re-election, it is clear that distrust and hatred of him would prove a rallying-cry in the legislative canvass. In New Jersey the movement is not so pronounced, yet the feeling that the representation of the State should no longer be vested in the person of Senator McPherson is strong and widespread among respectable Democrats. McPherson is not openly a candidate, nor is Sewell on the Republican side. Yet the latter is as much disliked and dreaded by the better Republicans as McPherson is by the Democrats, and the result is a general desire in both parties to pledge their candidates for the Legislature against "unfit nominees for the United States Senate"—McPherson and Sewell being the men tacitly aimed at.

---

The election in Arkansas on Monday was the first in which a certificate of the payment of a poll-tax was made a prerequisite to voting. "In consequence," says a despatch from Little Rock, "the negro was practically eliminated from the contest." But one trial of the system does not show how it will work always. In the three-cornered controversy this year the success of the Democrats was certain, and there was no inducement for either Republicans or Populists to pay the taxes of men who did not feel interest enough in the election to pay their dues themselves. It may be different when the time comes, as it doubtless will, that the whites of the State are pretty evenly divided. If a Mahone ever turns up in Arkansas with a campaign fund of $25,000 or $50,000, the negro vote will not be so thoroughly eliminated as it was on Monday. It may even happen, as it did in Virginia, that the poll-taxes of the blacks are more generally paid than those of the whites, and the Arkansas Democrats may finally feel constrained, as did those of Virginia after the rise of the Readjuster party, to repeal the tax law for the sake of their party.

---

Mr. Levi P. Morton's letter addressed to the Republicans of New York is a very straightforward composition. It means just what it says, namely, that if he is nominated for the office of Governor he will accept the nomination, and if elected he will serve. If he is not nominated he will give his cheerful support to anybody who is nominated. That is certainly a safe position, and it does not involve any humiliation if some other candidate is nominated. Mr. Morton is not a great man and he does not pretend to be. He is a safe man, and he has a certain amount of strength in his own party which proceeds from the feeling that he was unjustly treated at the Minneapolis convention two years ago. Of course everybody is asking whether Platt is for Morton or for Fassett. Everybody knows that he is not for Choate, because he cannot control Choate. Probably he will be for Morton if, as the time for the convention approaches, Morton seems to have a preponderance of strength, or he will be for Fassett under like conditions.

---

Secretary Morton of the Agricultural Department remains a surprise to the

professional politicians. Having advocated retrenchment during the canvass, he has been trying to enforce it ever since he entered the cabinet. The surest way of saving money which he saw was by shutting down on the absurd system of distributing seeds of the most common varieties of plants by the wholesale. The law provides for sending out only such as are "rare and uncommon to the country, or such as can be made more profitable by frequent changes from one part of our country to another"; and its obvious intent was to help the work of experiment in raising plants where they were not indigenous. Instead of this there has grown up a huge warehouse for the free distribution of ordinary seeds, which are sent by Congressmen "where they will do the most good" in making agricultural constituents friendly to them. Last year this branch of the department cost $140,000. This year Mr. Morton informed Congress that he could send out all the seeds which the law authorizes for $30,000. Congressmen were filled with indignation at this proposition to save more than $100,000; and, in their resentment, insisted upon marking up the appropriation higher than ever before, to $160,000. But the secretary would not give up. The act appropriated this sum "for the purchase, propagation, and distribution, *as required by law*, of valuable seeds, bulbs, trees, shrubs, vines, cuttings, and plants." Mr. Morton asked the attorney-general what this italicized clause means, and Mr. Olney replies that it undoubtedly refers to the earlier restriction of such purchases to "rare and uncommon seeds." So the secretary of agriculture at last wins his fight for economy.

---

The bulletin published by the Census Office, now in charge of Mr. C. D. Wright, in relation to "farm and home-owners" and mortgage indebtedness in this country comes appropriately on the heels of the same Mr. Wright's article in the *Yale Review* showing the practical worthlessness of all such statistics. No one ought to scan these figures without at the same time having in his hand the great bulletin of Superintendent Porter, issued in 1891, in which he explained his method of operation. In brief, this was to collect neighborhood gossip and opinions of the oldest inhabitants as to how much people owed and what rate of interest they were paying. Doing this for 102 selected counties and averaging up the results for the whole country was Porter's idea of the way to make a census. He admitted that the probable error might be as high as 15 to 20 per cent., but maintained that, even so, his figures would be of incalculable value. The results given out in that year were easily shown to be simply grotesque, and while as much cannot confidently be said of the complete tabulations now gathered and summed up, it may be confidently said that they are to be accepted only with the greatest caution, and after independent testing. To set about lashing them into the support of party and theory, as the *Tribune* hastens to do, is to darken counsel by figures without knowledge.

---

The Massachusetts Bureau of Labor Statistics has issued a report on the condition of the unemployed in that State based upon a thorough investigation during the past year. The results are rather disappointing. Interesting figures are presented giving the proportion of the unemployed by months during 1893, which show that more than 22 per cent. of those at work in the spring were without employment in September, when the worst effects of the depression were felt. The Citizens' Relief Committee in Boston disbursed $136,568 among this class last winter, the male applicants numbering 7,460, who had 22,284 others dependent upon them; and it is rather surprising to find that most of them were in the prime of life (only nineteen past seventy years of age), and had lived in the city many years. Despite the thousands in the cities who complain that they can get no work, the demand for agricultural labor has been in excess of the supply, and farmers have to employ intelligence offices to secure men at such good wages as $20 to $30 a month with board. Several methods of relieving the unemployed are discussed in the report, but little seems to be expected from the adoption of any of them. As the Massachusetts Bureau of Labor Statistics has always been the most intelligent in the country, it would appear reasonable to expect a contribution of positive value to the discussion of this problem, but the impression left by a reading of the report is that most of the people who are out of work are so shiftless and worthless that not much can be done for them.

---

The particulars of the debate upon the "Miners' Eight-Hours Bill," which was recently defeated in the British House of Commons, show the enormous practical difficulties to be surmounted before any such measure can be successful. The advocates of the bill insisted that it should be made of universal application in coal-mining, upon the ground that if any exceptions were made, it would be impossible to enforce it. But the opponents of the bill contended that the conditions of mining were so different in different places, that the attempt to apply a uniform rule would result in the greatest inequality. In order to prevent the possibility of evading the prohibitions of the bill, it was so drawn as not to limit the work to forty-eight hours a week, or an average of eight hours a day, but to forbid working more than eight out of any twenty-four hours. Furthermore, the period of work was reckoned from the moment when the miner began his descent into the mine to the moment when he completed his ascent out of it, or from "bank to bank," in miners' parlance. It was shown that in many old mines the enforcing of this restriction would limit the time actually spent at the face of the seam to five hours or even less; under which conditions such mines could not be worked at all. The coal-miners of Durham and Northumberland took a vote among themselves upon the act, with the result that four-fifths of them were found to be opposed to it. Against such an opposition as this no government could enforce the proposed act except under martial law. Coal-miners are a rugged and stubborn class, and they have never been slow in fighting vigorously for what they have considered to be their rights. If the police should be called in to prevent them from earning their customary wages by working their customary time —which, by the way, averages only about 7½ hours at the face of the seam —a contest would take place that would put the theories of socialism to a very severe test.

---

The French socialists have always found the peasant proprietors deaf to their wisest charming. In the cities, especially the manufacturing cities, it has been comparatively easy to get the landless and the houseless to agree to turning over all the property of other people to the state for common use; but the thick-headed agriculturist, with his feet on his own soil and his own roof over him, has not been able to see it in that light. His stubbornness on this point has at last forced a complete change in the socialistic plan of campaign so far as the country districts are concerned. In their future appeals to the peasant electorate the socialist orators are to pose as the most ardent defenders of the right of private property. Their fine collectivist theories are to be dropped for the sake of collecting a few votes. Such, at least, is the new programme, according to their eloquent leader, M. Jaurès. He says that there is to be an especial effort to win over the farming population to the socialist party, and that the burden of complaint will be, not that private property is robbery, but that taxes and trade combinations are ruining the farmer. It is not the peasant's labor which is spoliated like the artisan's, but the products of it, and good prices and low taxes will never come until the socialists obtain control of all the capital and manufacturing plants of the cities. The French farmers will scarcely be taken in by this.

### *A NEW ERA IN AMERICAN MANUFACTURING.*

THE old lady who crossed the equator with a nervous clutch on the ship's rail, to brace herself against the expected jar, was in a mental attitude not unlike that of some American manufacturers as the day drew near when the new tariff was to go into effect. They had been so often told that that day would mean ruin to them that they half expected to be ruined on August 28, no matter how prosperous the sea through which they had been sailing on August 27. But they have now got over the imaginary line without a bump, and it is not strange that they are beginning to think that all the evils which lie beyond may also prove imaginary.

Yet the transition is, after all, a momentous one, and it is not too much to say that many branches of manufacture in this country are entering upon a new era. The change in mental attitude alone is immense, and will be even more marked and telling as the days and months go by and demonstrate that goods can be made in this country without the gracious and supernatural intervention of McKinley. Of course, it will take time to break up among certain manufacturers the habit of lifting up their eyes unto Washington, whence cometh their help. But four years will accomplish wonders in this direction, and the leading organ of protection now reluctantly admits that no increase in duties can be had before 1898. In that period men will buy and sell and get gain. The present outlook is that they will do it on a large scale; but if they are able to do it on a small scale or on any scale at all, it must work a revolution in their inherited idea of the dependence of business prosperity upon high customs duties.

This revolution is already started, and is manifesting itself in striking ways. One way is the astonishing bursts of frankness on the part of manufacturers and trade journals. Truths which revenue reformers have been whispering in a corner, erstwhile protectionists are now proclaiming from the housetops. Here is a plain-spoken writer in the *Wool and Cotton Reporter* who tells the woollen manufacturers some homely truths to which reformers have in vain tried to get them to listen. He affirms that, though it is true that there have been a great many failures among woollen manufacturers during the past ten years, "nine-tenths of these failures would have occurred had the tariff been double what it was or is." The trouble is in the underling manufacturers themselves, he maintains, and not in their tariff stars. They are slack and behind the times in their business methods and mill equipment, and "want the laws of the country made so that they can make the greatest possible amount of money in the shortest possible time, and without any risk." This is the class of manufacturers who are "continually complaining and crying for more protection." They are the incompetent and lazy, who would naturally be driven to the wall in any business, to the great relief and profit of the competent and energetic; and yet they "cannot be forced out of the business as long as the Government protects them as it has done in the past."

Another manufacturer, taking up the question of ability to meet foreign competition under the new tariff, declares that "the old rattle-trap mills," filled with obsolete and worn-out machinery, cannot meet foreign competition or domestic either. On the other hand, mills "built to be operated," and equipped especially for some special lines of goods, under trained and scientific oversight, are on a paying basis and will continue there, no matter what the tariff rates. In line with this is the assertion of Rhode Island experts that some manufacturers in that State are able "to compete with Englishmen on their own terms." And a trade report on the New York woollen-goods market for the last week in August says that the buyers—of whom the market is "full"—are acting on the fact that "the supply for the spring season is to be drawn from domestic sources." This is due to the improved processes of manufacture and to a reduced cost of production, brought about by the hard times, and more than sufficient to overcome any tariff changes which have been made.

All this is a refreshing change from the doleful plaints of the alarmed manufacturers which we have heard in such a depressing chorus all these years. Equally refreshing is the good advice which trade journals are giving to the manufacturers within their special provinces. They are at last beginning to appeal to American inventiveness and pluck as the qualities which are going to enable us to meet our foreign enemies at the gates. The need of establishing technical schools is also wisely insisted upon, and the necessity of putting ourselves on a level with foreigners in the application of science to industry. Here has been the real superiority of the foreign manufacturer. An American manufacturer in straits has rushed madly off to Washington to get his duties doubled; the German has put a dozen more skilled chemists and Chemnitz graduates on his pay-roll, despatched polyglot drummers to all parts of the world to get orders, and thus been able to snap his fingers at our tariff.

That is the kind of thing that the American manufacturer will now have to do. He will have to conduct his business without the expense of a branch office in the ways and means committee-room. Instead of mortgaging his mill to defeat a tariff-reform Congressman, he will mortgage it, if necessary, to buy the newest machinery and latest patented devices and to employ superintendents who know their business. With free raw material he will not need to ask favors of anybody, or dread competition of any sort except the competition of superior skill. If the Yankee cannot hold his own in that particular, then all his boasting is vain. There is no doubt that he can, or that Mr. Gladstone is right in predicting the transference to this country of the industrial supremacy of the world, when once American inventiveness and practical skill and business talent are given a fair field and no favors.

### *OUR FOREIGN COPYRIGHT RELATIONS.*

THE recent proceedings in the German Parliament with a view to the abrogation of the copyright convention between that country and the United States again call public attention to the anomalous position occupied by our country in regard to literary property. It will be remembered that the Revised Statutes were amended by an act passed March 3, 1891, to go into effect July 1 of the same year, so as to grant a limited legal protection in the United States to the literary and artistic property of foreigners under certain alternative conditions. These conditions, set out in section 13 of the act, are to the effect that whatever advantages the new act insures shall apply to subjects of a foreign state only (*a*) when such nation permits to citizens of the United States the benefits of copyright on substantially the same basis as to its own citizens; or (*b*) "when such foreign state or nation is a party to an international agreement which provides for reciprocity in the grant of copyright, by the terms of which agreement the United States of America may at its pleasure become a party to such agreement."

It is difficult to construe this last clause. Evidently the framers of it had in mind the International Copyright Union and the inclusion of the United States therein. This union is founded on an international agreement for reciprocity of copyright, and, according to article 18 of that agreement, any country which within its own limits assures legal protection to the rights which are the objects of the convention, may be admitted to the union upon request; such accession implying adhesion to all the articles and admission to all the advantages of the treaty. But the second article of the convention stipulates that "the authors of any one country, or their assigns, enjoy for their works in all the other countries of the union, *whether such works are or are not published in one of these countries*, the rights which the respective laws now accord, or may in the future accord, to natives." It is clear, therefore, that the United States cannot subscribe

to the Berne treaty or become a party to the International Copyright Union so long as our law makes not only publication, but actual manufacture, within the United States, a condition to obtaining copyright; or that such adhesion to the treaty would have to be construed as nullifying the American-manufacture clause in the copyright act, so far as the authors of the countries now parties, or hereafter to become parties, to that treaty are concerned.

Just what was intended, therefore, by the insertion in section 13 of the copyright act of the words "at its pleasure," it is difficult to conceive, but apparently they were included upon a notion that the United States should be admitted to the Berne treaty upon the basis of the act of March 3, 1891; and for this view we have the authority of the Department of State in a letter addressed to the Swiss minister by Mr. William F. Wharton, acting secretary, who says:

> "It seems necessary to interpret them as signifying that the [international] agreement must admit of the adhesion of this government on the basis of the law in which they are found. In other words, the agreement can be said to permit the United States to become a party 'at its pleasure' only when such agreement admits of the adhesion of the United States, and extends to it the benefits of the conventional guarantees in return for the privileges which the present law affords."

That is to presuppose that the United States would be admitted into the international agreement to profit by the advantages offered by it, without being required to be bound by the stipulations binding upon the several other governments which are parties to the convention—an idea which proved futile.

The foreign governments interested contended, on the other hand, that, as the United States had been invited to join the Berne convention, and could at any time do so by signifying a desire to accept the articles of international agreement, the second condition expressed in article 13 of our copyright act was virtually complied with so far as the states within the International Copyright Union were concerned, and applications were made for the extension of the benefits of the act of March 3, 1891, upon this basis. But this interpretation was denied by the Department of State, whereupon France, Belgium, Great Britain, and Switzerland renewed application on the ground that the alternative stipulation contained in article 13 was fulfilled, because their respective laws already afforded to natives of the United States copyright upon substantially the same basis as to their own citizens. The Department of State having certified to the truth of this claim, after an examination of the copyright legislation of each country, President Harrison thereupon issued the first copyright proclamation, extending the application of the copyright law to the citizens of the above-named countries, including the British possessions, under date of July 1, 1891, the very day on which the copyright act went into effect. Upon similar grounds, a proclamation was published, also by President Harrison, in behalf of Italy, on October 31, 1892; and President Cleveland, by proclamations of May 8 and July 20, 1893, extended copyright protection to the citizens of Denmark and Portugal respectively. Negotiations were also entered into with Spain, but up to this time have not resulted in the promulgation of a proclamation.

Germany also had contended for a copyright proclamation on the ground of membership in the International Copyright Union, but this reason was declared insufficient. Neither was the alternative condition of section 13 of the copyright act satisfied; for while the laws in force in the German empire extend the protection of copyright to such works by foreigners as are issued by publishers in Germany, the statutes are declared applicable to the literary and artistic works of natives, whether published in Germany or elsewhere. Hence it was necessary to formulate a copyright treaty, which was signed at Washington, on January 15, and ratified on April 15, to go into effect on May 6, 1892—the first, and thus far the only, copyright treaty entered into by the United States. Article 1 of this convention provides that citizens of the United States shall enjoy in the German empire the protection of copyright as regards works of literature and art, and security against the illegal reproduction of photographs, on the same basis as such protection is accorded to subjects of the empire; while article 2 stipulates that in return the citizens of Germany shall be admitted to the benefits of the act of March 3, 1891. According to article 3, the treaty may be terminated at the end of three months after the day upon which either party thereto gives notice of withdrawal.

This treaty met with much opposition in Germany at the time of its proposal, on the ground that, under a show of reciprocity, the United States demanded a whole in exchange for a part. This complaint was not without foundation. The usual course has been to stipulate that the privileges guaranteed by a copyright convention shall not exceed in one country the rights secured by the laws of the other country to its own citizens. The benefits of our copyright act, however, were not offered in exchange for equivalent privileges to be secured to citizens of the United States under the laws of the German empire; but, upon the ground that under our laws foreigners could obtain copyright upon substantially the same basis as our own authors, we demanded that the same rights and privileges as were secured to the natives of Germany by its laws should be extended to our citizens. This was not an offer of equal exchange. The United States term of copyright, forty-two years, is one of the shortest in modern legislation, and the rights secured are saddled with such onerous burdens as simultaneous publication and remanufacture in the United States, while the statutes are clumsily framed and contradictory, and upon points of practical importance there is uncertainty, and consequent possibility of loss. The German statutes, on the other hand, are admirably drafted, the rights guaranteed are well defined and easily defended from trespass, and the term of protection extends thirty years beyond the life of the author, while no formalities are required except registration. It looked to Germans, therefore, not unreasonably, as if the United States had deliberately schemed to secure every possible advantage with the least return, and the demand of a double copyright-fee from foreigners seemed to accentuate our ungenerous spirit. The two years in which the treaty has been in force have served only to justify these objections, and to demonstrate that the sole advantage secured to Germans is protection to art works, maps, and musical publications, while it remains practically impossible to obtain protection for books, and they, together with whatever is published in German periodicals, are still free plunder for American literary pirates, who have not been exterminated.

---

### *THE NEW ENGLISH TAXES.*

Now that the income tax has actually been imposed upon us, it may afford those who will be especially inconvenienced by it a modicum of consolation to contrast their condition with that of the corresponding social class in England. This class has been afflicted with an income tax since 1842, and, although the hope was formerly extended to it by successive chancellors of the exchequer that the revenues of the Government might increase so as to admit of the discontinuance of this tax, the rise of socialism has now extinguished this hope. Not only has the prospect of relief been cut off, but the present burdens have been materially increased by the revenue act which has lately gone into effect. In addition to the income tax, what are known as "death duties," or taxes levied upon accumulated property whenever there is a change of title by will or intestacy, are henceforth to be charged not only upon personalty but also upon real estate. These duties are progressive, and upon large estates so high as to indicate the adoption of a distinctly hostile policy against the great families of the English landed aristocracy. The taxes are therefore not so much a fiscal as a political measure, and it is from that point of view that we propose to look at them.

It is true that some claim has been made that "symmetry" required that

as taxes were levied upon the personal property of a decedent, his real property should also be mulcted. This argument ignores the fact that real property is subject to local taxation, or "rates," in England, from which personalty is exempt. It also ignores the principle of the distribution of the incidence of taxation. No economist will deny that if mortgages are effectively taxed, the rate of interest will be raised to borrowers upon the security of real estate, and that the value of real estate will experience a corresponding decline. It is still more evident that a direct tax upon real estate causes a diminution of its value. It does not increase productiveness, while it subtracts from income. The possessor of real estate upon which a tax is imposed which he did not anticipate when he came into possession, inevitably suffers an impairment of his revenue. But the steady decline in the price of wheat and other agricultural products has notoriously diminished the rent-rolls of the great families of England to an extent which has seriously embarrassed many of them, and this added burden will undoubtedly give the *coup de grâce* to not a few.

It is common for theorists upon taxation to speak of the acquisition of property by descent or will as something like a windfall, part of which, as in the case of treasure-trove, may be seized by the tax-gatherers. It is generally the case, as a matter of fact, that the death of an ordinary man is not a pecuniary blessing to his family, but a serious disaster; while in the case of families of wealth, although the title may be in a single individual, the property is regarded as a family possession. The death of the nominal owner, therefore, can seldom improve the circumstances of those for whom he provided; and it is beyond question that the Government, in exacting a tax upon the inheritance of the widow and orphans upon the death of the husband and father, generally deprives them of a part of that income of which they have previously enjoyed the possession though not the title.

The family ownership of property is peculiarly an institution of the English aristocracy. The great estates are all "settled" in such a way that the tenant in possession, after he has satisfied the charges upon the property for the benefit of the female members of the family and its younger sons, has but a moderate income left. The new law, however, allows no exemption on this account. There may be half-a-dozen changes of title in a generation, and should such an event occur—and it is far from unprecedented—the entire income of a large estate for that period would be confiscated by the Government. Taxation was carried to this extreme under the later Roman Empire, but it is doubtful if anything like it has been seen under any civilized government. The Duke of Devonshire, in a speech full of dignified pathos, not long since explained to his tenants and neighbors at Buxton that it would be impossible for his family henceforth to contribute as they had done to public improvements. With an honorable pride he declared that neither his predecessors nor himself had looked upon the revenues of their estates as a means of exclusive, or personal, or selfish gratification. He made it no boast, and claimed for it no merit, that he and they had not only regarded it a duty, but had found it a pleasure, to devote a large, and in some cases the largest, portion of this revenue to objects in which the tenants and the general public had an interest. But as the exactions of the Government upon his death would amount to from six to ten, possibly to twelve, years' net income from the property, it required no calculation to see that its maintenance upon the former principles ceased to be possible.

This result is admitted to be probable by all, although many upholders of the new taxes regard it as lamentable. Lord Farrer, in a very earnest, although very feeble, defence of the budget, deplores the divorce from the popular party of the great houses who for more than a century "have loved the people well." He adds:

> "Nor can any one travel through this beautiful England of ours without feeling how much of its beauty, of its charm, of all its inherited 'wealth of hall and bower,' of park and moor and field and forest, traversed by pleasant paths and open to enjoyment by the whole community, is due to the proper pride, the wealth, the taste, and the liberality of successive generations of noblemen and squires who have spent in adorning the country the means and efforts which in other countries have been devoted to seaside villas or to urban palaces. It will be an evil time for town-dwellers in England when Yorkshire and Sussex, Cumberland and Devonshire, are cut up into ten-acre villas or three-acre allotments."

Lord Farrer endeavors to console himself for the coming downfall of the great families by the reflection that rich men will buy and maintain the country-seats which these families will be compelled to relinquish. Doubtless this will be so; but the sentiment of loyalty cannot survive the change. The lands once owned by the nobility of France are all occupied and their castles tenanted; but a rich *bourgeoisie* is not an aristocracy.

## *RAILWAY STATISTICS.*

THE report of the statistics of railways for the year ending June 30, 1893, issued by the Interstate Commerce Commission, comes with a reasonable degree of promptness considering the delays and difficulties encountered by the statistician in getting uniform and complete reports from our rail carriers. 'Poor's Manual' for the year 1893 has also been recently issued. The manual and the supplement to the *Financial Chronicle* occupy fields of their own which the federal volume does not cover; nevertheless, the interstate figures are better for broad generalizations and for comparisons of States and of railways by groups: it is these general statements which are now under discussion.

The first table printed by the commission is very suggestive. Of course the need of railways is measured by the character and quantity of the traffic furnished, but, in estimating on this need, the proportion of miles to area and to population is also an important factor. We select representative States to show the varying conditions:

| | Number of miles of line per 100 square miles of territory. | Number of miles of line per 10,000 inhabitants | | Number of miles of line per 100 square miles of territory. | Number of miles of line per 10,000 inhabitants |
|---|---|---|---|---|---|
| Mass..... | 26.4 | 8.9 | Nebr'ska | 7.2 | 49.2 |
| New York.. | 16.8 | 12.6 | Kansas.. | 10.8 | 58.7 |
| Penn..... | 20.6 | 16.6 | Wash't'n | 4.1 | 74.7 |
| Ohio..... | 20.5 | 21.5 | Califor'a | 3.0 | 37.2 |
| Illinois..... | 18.6 | 25.6 | Texas... | 3.5 | 38.7 |
| Minnesota.. | 7.4 | 43.8 | Alabama | 7.1 | 22.8 |
| Iowa..... | 15.3 | 41.8 | Georgia. | 8.3 | 25.3 |

The differences in the length of railroad to population are interesting. The Eastern States are apparently satisfied with a mileage but a fourth or a fifth of the number of miles built in our newer States in proportion to the number of people. Washington and Kansas are pre-eminent for this seeming overplus of railroad lines, though the former State does not rely exclusively upon agriculture. The farming States, again, are to be judged in part by the character of the crops—corn, for instance, justifying more miles of railway than cotton. Yet when allowance is made, the high figures for some of the Western States indicate a large railway mileage built for strategic purposes and in advance of the needs of the people. In time, of course, the ratio may become as low as at the East, yet the population of Kansas and Nebraska must double without any addition to the railway lines before an approach to that condition would be made. In part this difference is equalized by the facilities afforded and the cost of the railways of the two sections, the capitalization per mile at the East being double. The column of miles according to area being in inverse proportion—showing much less mileage at the West—reveals that the Western States are still sparsely populated, and have room for the people which the overbuilding of railways presupposes will come in the future.

Out of 1,890 railways in the United States, but 752 are independent companies—an increase of 40 over 1892. This brief statement shows how rapidly consolidation into systems is going on. Some good observers, indeed, believe that the problem of insufficient net earnings can be solved in no other way. A

fact looking in the same direction is that 42 companies have over 1,000 miles each, those 42 controlling 56 per cent. of all our railway mileage.

Though Congress in 1893 passed a law making automatic couplers and train-brakes obligatory after 1898, progress in equipping cars is slow, only 216,923 freight-cars out of a total of 1,013,307 being fitted with such couplers.

The total number of men employed in railway service on June 30, 1893, was 873,602. The annual increase in population is about 2.50 per cent.; the rate of increase in railway employment during the year was 6 per cent., while, if we count in the families, the percentage would be much larger. "Clearly," remarks the statistician, "there is no tendency as yet for the railway industry to lessen its claim on the laboring population of the country." Those employees figure out but a little over 5 per mile—a low average as compared with Europe, and one which speaks well for the efficiency of the American workman. The total railway capital reaches an enormous sum, which may be briefly stated thus:

| | Amount. | Per mile. |
|---|---|---|
| Common stocks | $3,982,009,602 | $28 184 |
| Preferred stocks | 686,925,816 | |
| Bonds | 4,504,383,162 | |
| Miscellaneous obligations | 410,474,647 | 31,545 |
| Income bonds | 248,132,730 | |
| Equipment trust notes | 62,699,282 | |
| Other debts | 611,610,171 | 3,692 |
| Total capital | $10,506,235,410 | 63,421 |

Of this total it appears that $1,563,022,233 of stocks and bonds were owned by the railways on June 30, 1893, an increase during the year of $171,565,180. $1,135,784,339 thereof were shares of stock; another indication of the tendency towards amalgamation in some form. It is of melancholy interest to note that nearly 15 per cent. of the above bonds and 61 per cent. of the above stocks received no return during that year.

The annual traffic per mile of railway shows a steady increase, whose average haul was 125 miles for freight and 24 miles for passengers. We hear so much of "through" business in these days that we are apt to forget until reminded by such small averages that the greater part of our railway traffic is "local," and is not carried very far. The average passenger journey is 15 miles in New England, 32 miles in Ohio, 38 miles in the South, 28 in the Northwest, 76 in Montana and Wyoming, 54 in Kansas, 50 in Texas, and 35 on the Pacific Slope. New England manages to crowd 61 passengers into each average train, while others must be content with 30 or 34, the average for the whole United States being 42. The average number of tons in a freight train is largest (238) for the Middle States, and smallest (121 and 137) for New England and Texas, the average for the United States being 184 tons. The relative economy of operation in different States and on different roads is thus shown. The percentage of operating expenses to revenue reveals a gradual increase, being 65.3 per cent. in 1888 and 67.8 per cent. in 1893. This steady encroachment of expenses on earnings is indicated in another way by the gradual decline in the average rate per ton-mile from 1 cent in 1888 to 8.7 mills in 1893—a small difference, but one productive of serious financial results when applied to so large an aggregate.

The record of accidents is humiliating. During the year, 2,727 employees and 299 passengers were killed, and 31,729 employees and 3,229 passengers were injured. Collisions, derailments, and accidents at stations account for the injuries and deaths of passengers. Employees were killed and injured principally by coupling cars and falling from trains, making a seriously large total. The transition period when the standard coupler is slowly coming into use is more destructive to switchmen than even the old link and pin. Train brakes when generally in use will also lessen the risks of employees. Compared with the ratio of safety in England, railroading in the United States is a venturesome employment, for safety to passengers and men is costly and railway incomes are limited.

## TOLSTOI ON PATRIOTISM.

PARIS, August 15, 1894.

A MOST singular sequel to the famous demonstrations at Cronstadt and at Paris which consecrated what is commonly called the Russian alliance, is to be found in a small book of 180 pages, which might be termed a pamphlet, by Count Leo Tolstoi. It bears the suggestive title of 'The Christian Spirit and Patriotism.' It appeared at first in some Russian review; I have it before me in an anonymous French translation. It has already created some sensation, as does everything coming from the pen of the celebrated author of 'War and Peace.' That extraordinary novel has for its theatre the Russian soil during its invasion by Napoleon and the "grande armée." When Tolstoi wrote it, he was not yet thoroughly imbued with the ideas which have found expression in his latest works; he had not yet discovered his "road to Damascus." Still, you can see in 'War and Peace' very peculiar views on the pretended art of war, on the value of strategical combinations, on the futility of the military plans of the best generals. Tolstoi speaks with many details of all the generals who had to resist the French invasion; he speaks also of Napoleon and his marshals—he makes them, in fact, live before us; but he evidently believes that war is a great game of chance, that the elements have as much to do as the men with its grand results. This theory is carried to its extreme in 'War and Peace'; it contains a part of the truth, but it is not the whole truth.

Tolstoi felt already, many years ago, a sort of contempt for military glory; this contempt was changed into horror when he became a reformer. The author of 'My Religion,' which is merely the religion of the Gospel, of what the first Huguenots in France called the "pur Évangile," has now become a systematic non-resistant, and in this quality he has declared war on war. This new state of mind explains his attitude on the question of the Russian alliance, for, in his opinion, this alliance is fraught with war. He begins his attack in these terms:

"The Russians and the French have known each other for centuries; sometimes they were on amicable terms, but more often, unfortunately, their Governments made them fight against each other. Suddenly happened this odd thing: because, two years ago, a French squadron came to Cronstadt, and its officers, having landed, ate and drank much, saying and hearing meanwhile lying and stupid words; and because, in 1893, a Russian squadron, in its turn, came to Toulon, and its officers, going to Paris, ate and drank much, hearing meanwhile words even more lying and foolish—for this double reason, this is what happened: not only the persons who had drunk and eaten and made speeches, but even those who had been present at these festivities, nay, all those who had not been present, but who had heard of them and read accounts of them—millions of Frenchmen and of Russians—began suddenly to think that they had quite a singular affection for each other, that all the Russians adored all the French, and that all the French adored all the Russians."

Tolstoi goes on in this vein; he gives extracts from articles published in the *Novoe Vremya* on the subject of the visit of the Russians to Paris. The reports of this interesting event given to the Russians were so detailed that the writers of the *Novoe Vremya* even gave to their readers the menus of the dinners offered to the Russian admiral and his companions. "They published also," he says, "the speeches which were pronounced; but the menus were more varied than the speeches." The same idea was expressed in a hundred forms: We love each other; our object is not war, it is not revenge. No, our object is peace; we wish to insure tranquillity to Europe. We love the Emperor and the Empress of Russia; we love also M. Carnot and Mme. Carnot. We love the army, we love the navy, but we also love peace. Many were the decorations exchanged, many the presents made to the Emperor of Russia, to Admiral Avelan, to his sailors; the milk of human kindness seemed to flow in everybody's veins. It is not difficult for Tolstoi to show that under the veil of this sudden mutual dramatic and sensational affection, there was in reality something which did not find an outward expression. The Russians and the French were animated not so much by affection as by a common sentiment of animosity; the name of Germany was never pronounced, but the thought of Germany, of the Triple Alliance, of the dangers which might arise for France in case this Triple Alliance ever became offensive instead of remaining defensive, the relief experienced in France since it was felt that the alliance of the three Emperors was for ever broken, and since the Emperor of Russia had manifestly shown that he would keep his hands free, make himself as strong as possible, and use eventually his increasing strength in favor of peace—all these sentiments, conscious in some, unconscious in many, contributed to give to the manifestations at Paris an importance which may be overrated, but which it is impossible to deny.

The general feeling among the people was a very simple feeling: "The Russians make us a visit; let us receive them well. We are no longer alone in Europe, as we have been since 1870; we have at last a friend." And nothing could be more spontaneous than the general decoration of the capital during the visit of Avelan. In the most humble streets, at the windows of the poorest people, you could see the French and the Russian flags together.

This genuine friendliness of the people had really something touching. It is only too easy for Tolstoi to point out many ridiculous incidents of the Russian visit; but there was in the manifestation of joy on the part of the population of Paris a chivalrous element which a man like him ought better to have perceived. The term chivalrous is perhaps too noble and too strong, but I find no other. In every Frenchman's thought the behavior of the Italians, who, with the memories of Solferino and Magenta fresh in their minds, boldly, one might say cynically, entered into the Triple Alliance, was strongly contrasted with the behavior of the Russians, who might reproach us with the useless war of the Crimea and the fall of Sebastopol, yet who would not, notwithstanding the most urgent entreaties, enter into any political alliance with our virtual enemies. The French, rightly or wrongly, credited the Russians with great magnanimity, and they wished not to appear insensible to it. I maintain, therefore, that there was something very unaffected, very spontaneous, very independent of charlatanism in the demonstrations of the French population on the arrival of the Russians.

Charlatanism, of course, in all such circumstances had fair play; the press especially found an admirable occasion for sensational articles and emotional demonstrations. The visit took place not very long after the Panama trial, when it had been found out that the press of Paris had more than its share in the plunder of the Panama Company, all under the name of "expenses of publicity." It therefore seized with great alacrity on Admiral Avelan and the Russians; it felt the need of a diversion; it became very emotional and patriotic. Patriotism was to do for it what Victor Hugo says of love:

"Et l'amour lui refait une virginité."

Admiral Avelan once appeared, in one of the fêtes, having on his right and on his left two gentlemen who had been somewhat prominent in the Panama affair. The admiral wears a beard with two points, and has, at a distance, a vague resemblance to Christ. A witty journalist, at the sight of Avelan with the two persons who were doing him the honors, said: "Look well at this, for no such thing has been seen since the days of Jesus."

Tolstoi compares the Russian demonstrations to the exhibitions sometimes given in certain mental epidemics: the whole affair seems to him a pathological case. This is a mere paradox, which does not deserve to be discussed. Tolstoi becomes more serious when he says that the protestations made in France as well as in Russia in the name of peace cover really projects and desires which are inconsistent with peace. Milliards of francs are spent in military preparations and millions of men are under arms in Europe. "The devil," says Tolstoi, "is the father of lies." He denounces as a lie this sudden affection of the Russians for the French, of the French for the Russians. He does not spare his own country:

"On the eve of the Turco-Russian war we witnessed a similar outburst. The Russians suddenly began to love I don't know which Slavic brethren. These Slavic brethren we had ignored for centuries, and really the Germans, the French, the English have always been and are even now infinitely nearer us than these Montenegrins and Serbs and Bulgarians. Then, also, we began to give fêtes and receptions which were magnified by these Aksakoffs and Katkoffs, who are justly looked upon in Paris as models of patriotism. Then, as now, there was talk of nothing else than of the love which the Russians suddenly felt for the Slavs of the Balkans. Then, exactly as it was yesterday in Paris, people met at Moscow, ate and drank and said foolish things, and felt moved with great sentiments, and spoke of unity and of peace; . . . and finally, Alexander II., who really did not want a war, consented to it. Hundreds and thousands of men died, and millions of men were reduced to a savage state and deprived of all Christian sentiments. Well, what took place in Toulon and in Paris, what is still going on under our eyes, leads evidently to an even more horrible carnage."

Tolstoi maintains that the people, the working population in all countries, is absolutely indifferent to political questions, which are the exclusive preoccupation of the governments. He maintains that patriotism is an artificial sentiment, fostered by these same governments, and which has no real foundation in the human heart, at least to-day in Europe. Patriotism seems to him the product of education, of literature, of journalism. "What," he says, "is called patriotism in our time is purely a disposition of mind perpetually kept up among the peoples by schools, religion, the venal press which works for the Government; it is also a temporary exaltation which the ruling classes excite by exceptional means in the class of people having the lowest moral and intellectual standard, and which is afterwards represented as the expression of the will of the whole people." "And what," he says again, "is this sublime sentiment which you teach the people? It is merely the preference given by each man to his own country compared to all other countries; it is perfectly well expressed in the German song, 'Deutschland, Deutschland über Alles.' You may replace the name of Germany with that of any other state, and you will have the complete formula of patriotism."

This attack on patriotism is really an attack on what the French call "chauvinism" and the English "Jingoism." It is followed by admirable pages on the Christian ideal of peace and universal brotherhood. It is impossible to read some of these pages without emotion. "Oh! how little would be necessary to deliver men from all the evils which stifle them if only they ceased to lie; if only they would not allow themselves to repeat the lie which is whispered in their ears; if they only told what they think and what they feel! . . . It is necessary that mankind should abandon the ancient public opinion, which has had its time, for the new public opinion. This change is as inevitable as the fall of the dead leaves in the spring." I am sadly afraid that the springtime Tolstoi dreams of is still very distant. The world is still in arms, and the struggle for life seems to become even more fierce.

## THE SEINE, THE MEUSE, AND THE MOSELLE.—I.

Berncastel am Mosel, August 14, 1894.

The basin of the upper Meuse lies between those of the Seine and the Moselle, like the dwindling territory of a little prince between the growing kingdoms of two powerful neighbors. First on one side, then on the other, one of its branches is lopped off, leaving now only a long slender trunk stream between the encroaching headwaters of its rivals. These changes are so manifest that they should not be recorded only in technical, scientific journals; they deserve the attention of a wider circle of readers, and particularly of those who, in travelling, enjoy looking into the significance and development of the landscape as they do into the sequence and meaning of historical events. To emphasize the story of the three rivers, I shall select the most manifest examples of the changes produced by their interaction, and tell first of the full-swinging meanders of the Seine and the Moselle, afterwards of the looser meanders of the upper Meuse, and finally of the reason for this contrast in the diversion of the Aire at Grandpré from the Meuse to the Seine by the Aisne, and in the diversion of the upper Moselle above Toul from the Meuse to the lower Moselle by a branch of the Meurthe. The rivers have of course been named with no regard whatever to these changes, which are only beginning to be recognized by geographers; but a glance at a good map will make the case plain enough.

The Seine from its middle basin to the sea is characterized by a remarkably sinuous course, which fully doubles the river distance from Paris to Havre over the length of a direct line between the two cities, and at the same time certainly adds wonderfully to the picturesqueness of its valley. The swinging curves of the river, and the sympathetic relation between the slope of the valley sides and the turn of the river curves, is one of the beauties of this part of France; but it is a beauty that the hurried traveller is not likely to see. Railroads seldom select fine points of view to guide their tracks, and the through lines from the Channel to Paris avoid the roundabout river course. Highways are much better in this respect; but better still is the combination of a bicycle on the roads and an occasional walk from the roads up the hillsides to outlooks that command the adjacent country. The roads are so good, the maps show the country, the roads, and the towns so well, the towns are so conveniently placed for stopping, their hotels are so sufficiently comfortable for the reasonable traveller, and the prospects on the way are so delightful, that an excursion from Havre to Paris in this manner is to be highly recommended.

For the sake of variety, the beginning of the journey may be made on the steamer that runs up the river with the racing tide from Havre to Rouen; and if fortunate in coming when the boat leaves Havre early in the morning, the traveller will have a long afternoon to continue his view on the wheel from the upper port. Duclair, at the apex of the first great northward bend below Rouen, is the proper place to disembark, about noon, because from the hill just east of the town so many features of river scenery are displayed. On ascending to the summit, the hill is seen to be merely the edge of a remarkably even upland in which the Seine has cut down its meandering valley. Broad vistas open across gently undulating fields, all at about the same level in whatever direction the eye turns, north of the Seine or south of it. Patches of woodland close the view; a few overtopping church spires point the sites of upland villages. The valley is strongly incised in the upland, its average depth being four hundred feet hereabouts. On either side of the north-bend of Duclair is seen a great south-bend, partly traceable by the course of the river itself, and easily recognized for a greater distance by the steep slopes of the valley with their white chalk quarries or their dark belts of trees on the outer side of the river curves. Between these south-bends and stretching towards the observer is a long sloping spur of the southern upland, projecting into the north-bend of Duclair, covered by the forest of Mauny on its higher southern part, but occupied by fields and villages where it gradually descends close to the level of the river at its northern end. Similar spurs from the northern upland project into the adjacent

south-bends, bearing the forests of Roumaire and of Jumièges on their shoulders, and slanting gently down to low fields and villages near their southern ends by the river. The high necks of the spurs are often narrower than their lower fields, which broaden into the river bends, so the northern and southern uplands are as it were dovetailed together for many miles up and down the winding Seine.

A marked feature of the district is the persistent manner in which the river swings on as long a curve as possible around the sloping spurs, throwing its current close under the steep bluff that descends from the opposite upland. This behavior so plainly suggests that the valley, steep on the concave slopes, descending gently on the convex spurs, has been cut down in the plateau by the river itself, that one wonders why earlier observers felt obliged to call on the agency of the sea to explain it. The river not only fills its curves, but it is expanding them by undercutting the steep bank and withdrawing from the sloping spurs; and of this fact, the view from Duclair offers a peculiarly interesting bit of evidence. Here coming down to the Seine by a narrow valley from the northeast is a little stream named Ste. Austreberte, like the village at its head ten miles away. Duclair lies at its mouth. Continuing in the same direction there is a dry valley for about three miles cutting obliquely across the next western spur, and thus isolating its southern part, which holds the forest of Jumièges, from the northern part which is crowned by the forest of the Trait. The local railway and the highway both follow the dry valley, thus making a short cut through the spur on the way from Duclair down to Caudebec. Now when you are on the ground, nothing can be plainer than that the Ste. Austrebert formerly ran on through this abandoned valley, mouthing at its further end in the next north-bend of the Seine near the village of Yainville; and further, that the change from that condition of things to the present has been caused by the lateral gnawing of the Seine, whereby it has expanded the Duclair north-bend and worked sideways into the neighboring channel of the Ste. Austreberte, then saying to the little stream, "Don't bother yourself about running further down your own valley, but come and join me here." It is one of the prettiest little examples of shifted streams that I have ever seen; and it illustrates perfectly the robust habit of the swinging Seine.

If you arrive early at Duclair and lose no time in going up the hill back of the town, you may, on descending, take your bicycle and run eastward past St. Martin and then southward by a not very good road, but passable, to Sahurs, at the southern end of the next eastward spur; there you may ferry over to La Bouille and lunch at a little café garden overlooking the river in that picturesque village. According to your rate of travel and your variety of objects, go on in the afternoon along the valley and see Rouen; or leave out the larger cities and cross over the narrow neck of the next spur by a zigzag road—pushing your bicycle up and coasting down—to Elbeuf and beyond as far as you choose. Don't go too far. Start early, take a good rest over the warmer hours at noon, and stop before dark, without too much perseverance in surely reaching the point you chose in the morning to stop in overnight. All the way up the valley, the Seine tells the same story, throwing its vigorous current close under the steep concave bluffs, and always edging away from the fields that descend so smoothly from the sloping spurs on the other side; not only filling its meanders, but enlarging them. The incident of the Ste. Austrebert is, however, not repeated by the Seine itself, although it is imminent in the case of the Epte, which enters from the north between Vernou and Bonnières. The highway on the north side of the valley between the little villages of Gasny and La Roche-Guyon crosses the narrowed neck of the spur now remaining between the river and its branch, and here the larger stream may some day cut through and take out the smaller one. The view down the two slopes to the Seine and the Epte from the sagging crest of this ridge-like neck is extremely suggestive of events to come. East of Paris, the detailed topographical maps show that the Marne has literally abstracted the Grand Morin below Meaux, thus indicating that the vigorous action of the trunk river is shared by this large upper branch.

Now crossing to the Moselle, it teaches the same lesson, but by another parable. This beautiful river leaves the open country of Lorraine and runs on its way to the Rhine in a deep and narrow valley between the plateaus of the Hunsrück on the southeast and the Eifel on the northwest. Like the lower Seine, its course here is most serpentine, and, like the Seine, it swings boldly round the outer curve of its meanders, leaving sloping spurs within the loops and cutting steep bluffs on the outside of its turns. Whether the Ste. Austrebert incident is here precisely repeated or not, I cannot say; but, curiously enough, the Moselle has played on itself the same trick that the Seine has played on the Ste. Austrebert. To see this well illustrated, it is best to go down below Trier and stop a day at the village of Mülheim or Lieser—or go on to the neighboring town of Berncastel if something more than village fare is desired. The river here runs with a strong steady current; in floods, it rises into the villages on its banks, and in some of the hotels you may see record of the height reached by the water above the first floor. To gain a view of the valley, go to Mülheim and walk southward for a mile or more up the road leading to Monzelfeld; you will there gain a height of five hundred feet over the river and the problem will be spread before you in a lovely picture. Something of the rolling uplands, several hundred feet above your station, may be seen both north and south; they hold out-of-the-way villages, and a primitive, hard-working, agricultural people, as I saw in crossing the Hunsrück to the Rhine. At about the level of our station, there is a very even and well cultivated platform, three or four miles broad, stretching up and down the course of the river; this marks a former valley plain, cut out of the rolling uplands by the Moselle before the land hereabouts was raised so high as it now stands. In consequence of a comparatively recent uplift of the region, the river has eroded its present deep and relatively narrow trench below its former valley plain; and the habit of meandering that was learned on the flat valley plain is still persisted in, thus producing the serpentine meanders for which the trench of the Moselle is famous; yet just below us the river runs for several miles on a tolerably direct course from west to east. One is always impressed, in looking at such a scene, with the immensity of time required for the river to cut the deep and narrow valley that it follows; it is seldom that a proper recognition is gained of the much greater immensity of time that was at an earlier period required to cut down and widen out the high level open valley plain, by which the rolling uplands on either side are broadly separated. Yet certainly a valley is narrow before it is wide; it must be young before it is mature. However long a time has elapsed during the erosion of the winding trench of the present Moselle in the uplifted land, a much greater time was needed for the erosion of the wider valley plain before the land was uplifted; but this only by the way.

The sweeping curves of the Moselle must be closely scanned. The Berncastel bend is full in sight and shows the broad river between the sloping spur on the north and the steep concave bluff on the south. Just as well as the Seine, the Moselle is cutting into the bluffs and leaving widened fields on the slope of the opposite spur. Here and there small lateral streams come down from the rolling uplands in steep-sided ravines, and these often guide the roads or paths that lead up to the villages on the high country. But in contrast with these narrow lateral ravines, the view before us shows two larger valleys joining the Moselle from the south, back of Mülheim, and two others coming from the north, back of the opposite village of Lieser. On looking closely, the two larger valleys back of Mülheim are seen to join at their heads, about two miles back from the river, forming a horse-shoe curve, open towards the Moselle and including an isolated hill within their circuit. The same is true of the two valleys back of Lieser. The curve of these horse-shoe valleys is the same as that prevailing in the meanders of the Moselle; the breadth of their floor is practically the same as that of the present river valley. Around the toe of each shoe, the concave bluffs of the enclosing hills are perfect matches of the concave bluffs that rise from the curves of the Moselle, even to the vineyards on the sunny slope around the northern shoe, and the forests on the shaded slope around the southern shoe. Inside of each shoe, the isolated hill descends gradually into the curve toward the encircling bluff, in proper river-made fashion. But along the horse-shoe valleys, there are now only small streams coming in from the back country; the floor of the valleys, about a hundred feet over present river level, is occupied by fertile fields, with close-packed villages here and there. Now is it not plain that the Moselle must have flowed around these horse-shoe curves, before it gained its present direct course between them? In that earlier time, it formed here a strong double loop, like a close-pressed letter S, but when the valley was cut down to within about a hundred feet of its present depth, the encroachments of the meanders at the ends of the S wore through its middle, and then the present straight course between Mülheim and Lieser was adopted. If further proof of this is wanted, it is found in the relative position of the horse-shoe valleys; the arm of the southern shoe being just opposite and in line with the west arm of the northern shoe.

It is curious that the guide-books of the region do not urge visitors to seek this delightful and impressive view, and explain to them a little of its meaning. Of course the ruined tower over Berncastel must be visited; the entrenchments of two centuries ago on the old valley plain above Traben are doubtless worth seeing; but why not give a due share of attention to the river ruins as well? They have been well known to geologists for years past; others like them are known elsewhere on the Moselle; but the traveller, even the intelligent traveller, runs past them blindfold. The recognition of these old river beds and bluffs—now fields and vineyards—adds wonderfully to the enjoyment of the region. As at Duclair on the Seine, so at Mülheim on the Moselle

it is worth while stopping to see how fully these vigorous rivers are up to their duty of swinging round their meanders and widening their valleys on curves of true form.

## SUNDRY QUESTIONS.

To the Editor of The Nation:

Sir: A constant reader for many years of your paper, who has learned much therefrom, and who cares more to reach the truth than to justify the theories of any political party, would regard it as a favor to himself and to many of your readers if you would answer the following five questions:

(1.) Was it not as justifiable for President Harrison to allow the Sherman Silver bill to become a law as for President Cleveland to allow the Gorman tariff to become law?

(2.) Is not the Democratic party as censurable for allowing a small minority of its representatives to force upon it a highly protective tariff as the Republican party for allowing a minority to compel it, in the case of the McKinley law, to adopt higher rates on certain articles than the majority approved?

(3.) Is not President Cleveland as wrong in failing to support the principles of civil-service reform which both he and his party have solemnly avowed, and in using patronage to influence legislation, as Senator Gorman in yielding to the influence of rich corporations and blocking his party's tariff legislation?

(4.) If a business revival shall follow the enactment of the Gorman tariff, but not so great as that which followed the passage of the McKinley law, will the lesser revival show the Gorman law to be better than the McKinley?

(5.) If those branches of business which are given by the Gorman tariff a protection satisfactory to Senator Aldrich and other reasonable protectionists shall prosper, and those branches which are deprived of all protection shall not prosper, can such a result fairly be made an argument against protection?

A Tariff Truth-Seeker.

Boston, September 1, 1894.

[Several of the questions asked by "A Tariff Truth-Seeker" we shall not attempt to answer, for two reasons. In the first place, the questions do not admit of answer, and in the second place it would be idle to answer them if they did. None but the Almighty can measure the relative turpitude of failing to support civil-service reform and of yielding to the influence of rich corporations. When any person is brought to the alternative of choosing between two evils, he may have to determine which is the less; but no such alternative here exists. Nor can business revivals be nicely measured and compared and referred to tariff laws as their causes. After the McKinley act was passed, we had fine crops in this country, while the harvests abroad were bad. We also had a Silver act and a Pension act. This year our crops are not of the best, while the yield in Europe promises to be excellent. For the solution of problems arising under such various conditions the best resort is to Mill's 'Logic.' So as to the relative prosperity of different branches of business. One of the arguments against protection is that, even if it makes a branch of business prosper, it is by taxing the whole community. Hence if such prosperity could be demonstrated to be due to tariff duties, it would make no difference with the free-trade argument.

The first two of our correspondent's questions admit of scarcely more definite answers. As to the first one, the answer depends upon the views held concerning the merits of the two bills. If the Silver bill was a good measure for the country, and if Mr. Harrison thought so, he was certainly justified in signing it. If it was a bad thing, but Mr. Harrison thought it was a good thing, he may or may not have been justified. If it was a bad thing, and he knew it, but knew that Congress would pass it over his veto, he may perhaps have been justified in signing it. As to Mr. Cleveland and the present law, his conduct in not affixing his signature has very little moral significance. He did not sign the bill, because it was not just the bill that he wanted to sign; but as he knew that it would be a beneficial measure to his country, he did not veto it. We do not understand how any comparison can be instituted between cases that have so little likeness as these. When it comes to "arraigning" an abstract entity, such as a political party, we confess that we find the same difficulty as Burke did in drawing an indictment against a whole people. But our correspondent assumes in his question facts which do not exist. The McKinley bill was not forced upon the party by the action of a small minority who declared that they would defeat the bill if they could not shape it as they wished. The Republicans could have passed it in any shape satisfactory to the majority, and did pass it in a shape satisfactory to them. Proof of this is furnished by the unanimity of the party organs in commending the measure, compared with the numberless protests now raised by the Democratic journals against the measure which half-a-dozen Senators compelled the party to accept rather than abandon reform altogether.—Ed. Nation.]

## OUR FIRST POET.

To the Editor of The Nation:

Sir: In his account of the celebration of Bryant's one hundredth birthday, did not your correspondent make a not unimportant omission in speaking of the poets who achieved reputation in the first half of the century? Among the poets who might possibly be regarded as the "first" American poet it appears to me that the name of Richard Henry Dana should not be forgotten. Dana has some claim to be called the Nestor of American poets. Older than Halleck, his life (1787-1879) overlapped at both ends the life of Bryant, though his poems were not published until ten years after the appearance of "Thanatopsis." His poetry, though meagre in quantity, is more than respectable in quality. If essentially a "one-poem" poet, he cannot be dismissed with writers of the calibre of Hopkinson, Key, and Payne. The "Buccaneer" surely surpasses in literary excellence "Hail, Columbia," "The Star-Spangled Banner," or "Home, Sweet Home," even if it does not rival those homely productions in popular esteem; and in originality and imaginative quality it is, in the judgment of some, superior to anything Halleck ever did. Upon its first appearance the "Buccaneer" was greeted by distinguished English critics as the most original contribution to American poetry that had yet appeared. Some of Dana's minor poems, as, for example, the "Beach Bird" and the "Pleasure Boat," are very sweet and graceful. It should not be forgotten, moreover, that Dana was the one to whom "Thanatopsis" was submitted for publication, and who was responsible for its appearance.

Emerson Opdycke Stevens.

Cleveland, O., August 28, 1894.

## HISTORY FOR OHIO SCHOOLS.

To the Editor of The Nation:

Sir: While glancing over the shelves of a bookstore recently, my eye fell upon a little volume entitled 'One Thousand and One Questions and Answers on United States History.' As I was turning the leaves at random, I noticed the following question on the administration of Jefferson: "What laws were first repealed?" The answer was, "The unpopular laws against foreigners and the freedom of the press." I concluded that it might be worth while, for amusement, to look a little further into the work of a writer on United States history who was ignorant of the method of demise which befell the famous Alien and Sedition Laws. A little further on I discovered that John Marshall "*performed the great task of modifying the laws adapted to the colonial times to suit the altered form of government in the national period.*"

I was striking "pay dirt," so to speak, in my search for amusement, and I kept on. The query, "With whom was the idea that the world is round original?" is answered: "Sir John Mandeville, *in the first book ever written*, declared the fact, A.D. 1356." Turning but a single leaf, the question is asked: "What was the belief in the thirteenth century respecting the shape and size of the earth?" and answered, "They began to admit the rotundity of the earth, but greatly underestimated its size."

This discovery that the people of the *thirteenth* century were beginning to admit the truth of an idea which, according to the answer of a preceding question, did not originate until the middle of the *fourteenth*, prepared me, in a measure, for the following:

"(159.) What of Professor Morse's invention?

"(*Answer.*) He invented the magnetic telegraph, which was the *grandest event during Polk's administration.*

"(160.) What was the first news ever sent on the wire?

"(*Answer.*) *The announcement of Polk's nomination.*"

But the most startling information is yet to come (p. 76):

"(369.) What was the Bland silver bill?

"(*Answer.*) *It demonetized silver and made gold the sole standard of our currency!*"

As the *Nation* is not professedly a humorous paper, it might seem out of place to bring this nonsense to its columns, but there is a serious side to the matter. This is one of a series of

books which are sold to our country school-teachers at almost every teachers' institute in Ohio and probably in adjoining States. It has been on the market since 1882, and it bears the imprint of a Cleveland firm doing perhaps the largest book-business in Ohio (The Burrows Brothers' Co.). When such a book can meet with sufficient sale to call from its author (one B. A. Hathaway) similar works in at least seven other branches, with the promise of more to follow, one is tempted to wish that we could have reënacted what this would-be historian calls the law "which punished freedom of speech and of the press with fine and imprisonment." W. H. JOHNSON.

GRANVILLE, O., August 28, 1894.

## OFFICIAL INTELLIGENCE.

TO THE EDITOR OF THE NATION:

SIR: I was desirous of ascertaining what relation exists in the several States betweeen taxation and the suffrage franchise. My books of reference do not agree in the case of Pennsylvania. To clear this up, I addressed a letter to the Secretary of that State, asking if the payment of taxes was a condition precedent to the exercise of the suffrage franchise. The reply from the Secretary's office consisted of two printed forms, one a letter of transmittal enclosing a blank for use by a foreign corporation doing business in Pennsylvania, and conveying the information that a fee of $10.75 was required for filing the enclosed blank.

These blanks were returned to the Secretary's office with a suggestion that they had probably been sent to me through clerical error, and asking that the information requested be furnished me. They were, however, again forwarded to me with a letter of transmittal, written on the headed paper of the Secretary's office, of which the following is a copy:

PENNSYLVANIA. OFFICE OF THE SECRETARY OF THE COMMONWEALTH,
HARRISBURG, August 27, 1894.

*Frank K. Mills, Esq., Leavenworth, Kans:*

MY DEAR SIR: In reply to your letter of the 24th inst., I would beg to say that the only condition precedent to the exercise of the right of doing business in this State is that a foreign corporation file a statement which I enclose, and pay this Department the fee of $10.75 for doing so. This fee is not at all in the nature of a tax, but is a police regulation which was adopted for the protection of the citizens of this State. Kindly give this matter your further attention and let me hear from you. Yours very truly,

WM. F. HARRITY,
Secretary of the Commonwealth,
per T.

It is a matter of congratulation that the secretaries of other States do not make use of a foreign corporation law to extort $10.00 from their correspondents.

FRANK H. MILLS.

LEAVENWORTH, KANS., August 31, 1894.

## THE MARQUIS OF SALISBURY'S AGNOSTICISM.

TO THE EDITOR OF THE NATION:

SIR: The magnificent address of the Marquis of Salisbury before the British Association, August 6, has some very forcible sentences which will fairly allow a much wider application of them than the author himself has made. Referring to the theory of evolution and the vast problems suggested by it, which science has not even begun to solve, and knows not how or where it could begin to study, he says: "The great danger scientific research is running at the present time is the acceptance of mere conjecture in the name and place of knowledge, in preference to making frankly the admission that no certain knowledge can be attained." Then he adds these most weighty and sensible words:

"We are under no obligation to find a theory if the facts will not provide a sound one. To the riddles which Nature propounds to us, the profession of ignorance must constantly be our only reasonable answer. The cloud of impenetrable mystery hangs over the development and still more over the origin of life. If we strain our eyes to pierce it, with the foregone conclusion that some solution is and must be attainable, we shall only mistake for discoveries the figments of our own imagination."

Instead of "to the riddles which Nature," say to the riddles which *religion*, "propounds to us, the profession of ignorance must constantly be our only reasonable answer," and we shall have a truth quite as widely and practically important. So, instead of "the origin of life," let us say, "the cloud of impenetrable mystery hangs over the development and still more over the origin" of *religion*. Then the following sentence describes exactly the way in which all the theologies in the world have been manufactured. "If we strain our eyes to pierce" this mystery, "with the foregone conclusion that some solution is and must be attainable, we shall only mistake for discoveries the figments of our own imagination." Exactly so were the theories of the Nicene and Athanasian creeds devised—those theories of "Trinity and Incarnation" which Mr. Gladstone, in the August *Nineteenth Century*, speaks of as "the central truth of the Gospel," which he says is testified to by some four hundred millions of Christians, but of which—in spite of Mr. Gladstone's assertion—the Apostolic age *demonstrably* knew nothing. One needs only to study without bias, and purely for the sake of getting at the truth, the methods and the state of mind of the men who made those creeds, and he will be compelled to see that they went to work upon the language of Scripture and the traditions that were around them exactly as Lord Salisbury describes—"with the foregone conclusion that some solution must be attainable." Evidence for their theories there was none, and in the nature of the case there could be none; the mystery of the Divine nature is at least as impenetrable as that of the origin of life. X.

NORTHAMPTON, MASS., August 29, 1894.

# Notes.

THE third volume of Mr. James Ford Rhodes's History of the United States after 1850 is now getting into print, and will be published by the Harpers in the course of the winter. The interval between this and the succeeding volume will be partly spent by the author in procuring much-needed physical rest abroad.

The University Press, Cambridge, England, has committed to Mr. W. J. Stillman a volume in its historical series, viz., the History of Italy from 1815. Mr. Stillman will have the assistance of Senator Chiala, author of a series of publications of diplomatic documents on the epoch in question, and will moreover have access to Signor Crispi's unrivalled collection of notes and documents relating to the period after 1848.

Macmillan's autumn list of announcements we can give but in chosen examples, following with one exception the divisions by authors adopted by the firm. American:—'American Book-Plates,' by Charles Dexter Allen; 'The Production of Ex-Libris,' by John Vinycomb; 'The Life and Art of Joseph Jefferson,' by William Winter; 'Architect, Owner, and Builder before the Law,' by T. M. Clark; 'Weather and Forecasting Methods,' by Thomas Russell, U. S. Engineers Office; 'Chronological Outlines of American Literature,' by Selden L. Whitcomb; 'History of the English Language,' by Prof. Oliver Farrar Emerson of Cornell; 'Selected Poems by Aubrey De Vere,' with an introduction by Prof. Woodberry; 'Text-book of Anatomy and Physiology for Nurses,' by Diana Clifford Kimber; 'Mental Development in the Child and the Race,' by Prof. J. Mark Baldwin of Princeton, the first volume being of "Facts and Theories"; 'A Course in Experimental Psychology,' by Prof. J. McKeen Cattell of Columbia; 'A Dictionary of Chemical Solubilities—Inorganic,' by A. M. Comey; 'A Corner of Cathay,' by Adele M. Fielde; 'History, Prophecy, and the Monuments,' by Prof. J. F. McCurdy of Toronto, in two volumes; 'Sketch of the Political History of England,' by Goldwin Smith, and an enlarged edition of his 'Essays on Questions of the Day'; Paulsen's 'Character and Historical Development of the Universities of Germany,' translated by Prof. E. D. Perry of Columbia; Viollet-le-Duc's 'Construction,' translated by George Martin Huss; and 'Raphael's Madonnas and Other Great Pictures,' with text by Karl Károly. English:—The second volume of the third edition of Bryce's 'American Commonwealth'; 'Essays on International Law,' by Prof. Westlake of Cambridge; 'A History of Epidemics in Great Britain,' by Charles Creighton, M.D.; 'A Short History of English Commerce,' by W. Cunningham, D.D.; 'The British Fleet,' by Commander Robinson, R.N.; 'London Up to Date,' by George Augustus Sala; 'Essays and Studies,' by J. Churton Collins, reprinted from the *Quarterly Review;* a new and complete edition of Browning's works, in nine volumes octavo; an Index to the six volumes of Masson's Life of Milton; 'Western Europe in the Fifth Century,' and 'Western Europe in the Eighth Century,' Oxford lectures by the late E. A. Freeman; 'The Letters of Matthew Arnold,' edited by G. W. E. Russell, M.P.; 'The Life of Sir A. C. Ramsay,' by Sir Archibald Geikie; 'The Life of Cardinal Manning,' by Edmund Sheridan Purcell; 'The Life and Letters of R. W. Church, late Dean of St. Paul's'; 'John Russell, R.A.,' "the prince of crayon portrait-painters," by George C. Williamson; 'Sketches in Sport and Natural History,' by the late George Kingsley, M.D.; a second series of 'Studies in Modern Music,' by W. H. Hadow; 'The Uses of Life,' by Sir John Lubbock; Chaucer's 'Canterbury Tales,' edited in two volumes by A. W. Pollard; Lord Berner's 'Froissart's Chronicles' reduced to one volume by G. C. Macaulay; Mazzini's Essays, chiefly political, translated by Bolton King; 'Tales of Naples and the Camorra,' by Charles Grant; the Syriac Gospels, transcribed from the Sinaitic Codex; 'Syriac Literature,' by William Wright; 'Life in Ancient Egypt,' from the German of Adolf Erman; 'Australia,' by Miss Shaw; 'The Meaning of History,' by Frederic Harrison; a translation of Adolf Holm's 'Greek History from its Origin'; 'The End of Elfinland,' by Jane Barlow; 'Wild Animals in Captivity,' by J. E. Cornish; a translation of Schorlemmer's 'Rise and Development of Organic Chemistry'; and 'Modern Book Illustration' and 'Pen Drawing and Pen Draughtsmen,' by Joseph Pennell.

D. Appleton & Co. will publish directly 'Abandoning an Adopted Farm,' by Kate Sanborn.

'The Life and Inventions of Thomas A. Edison,' by W. K. L. Dickson and Antonia Dickson, which has partly appeared in *Cassier's Magazine*, will shortly be brought out, with profuse illustrations, by T. Y. Crowell & Co.

From the Scribners we are to have 'The Wagner Story-Book: Firelight Tales of the Great Music Dramas,' by W. H. Frost, with illustrations by Sydney R. Burleigh; and "The Norseland Series," three volumes by Prof. H. H. Boyesen, chiefly new editions, and a fourth, 'Norseland Tales,' hitherto unpublished.

Houghton, Mifflin & Co. are passing through the press Mr. Samuel T. Pickard's authoritative 'Life and Letters of Whittier,' which will not preclude a volume devoted to this poet in the "American Men of Letters Series," to be prepared by Prof. George R. Carpenter of Columbia; and the 'Life, Letters, and Diary of Lucy Larcom,' edited by the Rev. D. D. Addison.

The Letters of Emily Dickinson are soon to be issued by Roberts Bros.

'Character Studies, with some Personal Recollections,' is the title of a work by Frederick Saunders of the Astor Library, which Thomas Whittaker has in press.

While the new 'Ritter's Geographisch-Statistisches Lexikon' (Leipzig: Wigand; New York; Westermann) is advancing rapidly, and has fairly entered on C in its fifth instalment, a rival French enterprise has been launched, 'Lexique Géographique du Monde Entier' (Paris: Berger-Levrault & Cie.; New York: Dyrsen & Pfeiffer). The new gazetteer is almost identical in size with Ritter, giving three columns to the page, however, instead of two, and making use of graphic signs for post, telegraph, and railroad stations. For the most of Europe as for the United States, the minimum population of inclusion is 350 (occasionally 250) inhabitants, but the stations just named will be included anyhow, and in this particular no work that has yet appeared can compare with the 'Lexique Géographique.' The specimen page shows an excellent typography, and more titles but a little less fulness than the corresponding tract in Ritter. The complete work will make three volumes of 1,000 to 1,200 pages each.

Another considerable subscription work, that commends itself to lovers of dogs, 'Geschichte und Beschreibung der Rassen des Hundes,' by Ludwig Beckmann (Brunswick: Vieweg; New York: Westermann), is entering on its second volume. It is illustrated with numerous woodcuts.

The indispensable congeries of catalogues called 'The Publishers' Trade-List Annual' duly makes its appearance for 1894 (New York: *Publishers' Weekly*). It is one of the few publications in the world which we prize for its bulk rather than for its quality, and it actually overspreads its predecessor when placed beside it. It is perhaps somewhat remarkable that the binding together of so many catalogues had had no appreciable effect in producing uniformity of style.

'The Image of War, or Service on the Chin Hills' (Calcutta: Thacker, Spink & Co.), by Surgeon-Captain A. G. E. Newland, is the photographic history of a military expedition on the Indian frontier. An admirable series of pictures illustrates incidents in the march of the troops, scenes at the encampments (interesting as showing the strange mixture of races in the men composing the force), and representations of the natives of the different tribes encountered, their dwellings and manners of life, as well as of the scenery of the Hills. The most striking of the groups of scenes in camp-life is that of the "provost-marshal at work." In some of the pictures of the native villages there are to be seen in front of the houses posts, hung with trophies which are not unlike the totem posts of Alaska. The accompanying text consists of disconnected sketches, generally explanatory of the pictures, but also giving a brief account of the expedition. This was composed of four columns of troops operating from different directions, and was sent out in the open season of 1891-92 to subdue the Chins, who were in the habit of making destructive raids into the plains of Assam and Burma. The end was accomplished without bloodshed.

In her two-volume work on 'Primitive Civilizations, or Outlines of the History of Ownership in Archaic Communities' (London: Swan Sonnenschein; New York: Macmillan), Miss E. J. Simcox has turned to account the results of recent research in England, France, and Germany. She believes that a complete history of ownership would furnish a complete history of civilization, or of the human race; "for the character of religious beliefs, the state of art and science, and the course of political and social development are all reflected in proprietary institutions." The question of ownership is only one of many features of primitive civilization with which the author deals; agriculture, commerce, industry, classes of society, domestic relations, family and commercial law, forms of government, the succession of dynasties—all receive considerable attention, especially as regards ancient Egypt, Babylonia, and China. The whole of the second volume is devoted to China. The introductory remarks concerning the analogies in the civilization of these three countries and concerning the ethnological affinity of their inhabitants are somewhat vague and desultory; but the body of the work contains much interesting material gathered from a wide range of authorities.

Dr. John Nisbet's book on British Forest Trees was noticed in these columns about a year ago. He has now published 'Studies in Forestry,' being a short course of lectures on the principles of sylviculture delivered at the Botanic Garden, Oxford, during the Hilary and Michaelmas terms, 1893 (Oxford: Clarendon Press; New York: Macmillan). The volume contains fourteen chapters, or lectures, and is a concise but well-digested treatise on forestry, both in general, and especially as relating to Britain. The author argues that, on the whole, mixed forests are more beneficial to the land than forests of one kind of tree, and considers it well that the shade of the forest should be so dense that the soil should be protected from sun and wind, and from "a more or less rank and unremunerative growth of weeds." In the eighth chapter he gives good reasons for preferring natural reproduction of forests to the system of planting from nurseries, but admits that sometimes nature may be the better for a little artificial assistance. Now that Americans are waking up to the need of forest preservation and sylviculture, such books as this are likely to prove of use as well as of interest.

Prof. Trimble's second volume on 'The Tannins' (Lippincott) is devoted to the results of the author's investigations of the astringent principles from "nine species of oaks and one species each of mangrove, canaigre, and chestnut." The method of preparation of the tannin is given in each case, and there is some discussion of the behavior of the several tannins with different reagents. Mangrove-tannin comes principally from India; but there is no reason why a limited quantity might not be procured from the shores of the Gulf of Mexico. Canaigre is not a familiar word: it is given to a kind of dock (*Rumex hymenosepalus*, Torrey), which in general appearance is much like the "yellow dock" (*R. crispus*) so common in waste places. The writer states that the tuberous roots have been used by the Mexicans in tanning for over two centuries. The quantity of tannin in the roots is large, since the average is about 30 per cent. Experiments are now being conducted in Arizona to see whether the plant can be profitably cultivated for its production of tannin. Chestnut, both the wood and the bark, yields tannin, and in the mountains of Pennsylvania and Virginia are works for the production of the "extract," which "appears in commerce in both liquid and solid form." That tannins have been the subject of much investigation may be seen from the fact that an index to the literature of them fills no less than thirty pages of this monograph.

John Wiley & Sons publish Dr. A. Worcester's 'Small Hospitals,' whose value is increased by Mr. W. Atkinson's "Suggestions for Hospital Architecture, with plans for a small hospital." The text is full of shrewd advice for the concentration of the energy of a community, and the control of those divergent forces which, even in the best of causes, render brotherly coöperation difficult. Such antagonisms acquire most force in the smallest societies, and call for no small measure of diplomacy. In all this preparatory work the author's advice is sound, and is given colloquially, not *ex cathedra*. There should be a crop of such hospitals if the little book is read as widely as it deserves. The plans are good and economical.

Prof. Berthold Litzmann of Bonn, who enjoys the distinction of being one of the few German professors condescending to take an active interest in the literary movements of the present time, has published an instructive book on 'Das deutsche Drama in den litterarischen Bewegungen der Gegenwart' (Hamburg: Leopold Voss). An outgrowth of public lectures delivered at the university, and appealing to the thoughtful student of literature rather than to the literary historian, the book is a most refreshing oasis in the desert of exhaustive and exhausting monographs, of purely antiquarian interest, in which so large a part of modern criticism is languishing. Prof. Litzmann is a firm believer in the idealism of the great eighteenth-century writers, but this does not make him a worshipper of the pseudo-idealistic formalism of men like Gutzkow and Heyse, and it does not prevent him from feeling the thrill of new life which is pulsating in the boisterous and effervescent "Grün-Deutschland." His instinct for the significant and representative makes him point to Sudermann and Hauptmann as the two men destined to become the regenerators of German literature. There is something naïve and juvenile in his appeal to the latter to cleanse himself from the poison of Ibsenism: for where would Hauptmann be without Ibsen? Still, if Hauptmann really is the great poet he seems to be, he must of necessity outgrow Ibsen and his kin. If for nothing else, this book deserves to be read for the masterly analysis of Hauptmann's first great effusions, "Vor Sonnenaufgang" and "Das Friedensfest." We regret that "Die Weber" did not receive more careful attention from Prof. Litzmann.

Leconte de Lisle left enough verse, of the kind approved by his difficult taste, to fill a volume. Mme. Leconte de Lisle intends to publish these poems about the end of the present year. Several of them have appeared in the *Revue des Deux Mondes*, but the most important feature of the volume will be the fragments of the "États du Diable," left unfinished by the poet. It is a terrible picture of mediæval horrors, in which Alexander VI. and the Borgias figure prominently. Lemerre will bring out the book. It appears that the drama "Frédégonde," in verse, which Leconte de Lisle had blocked out, and of which he had completed the first act, was burned by him as unsuited to the stage. He was so diffident concerning the worth of his verse that, despite the pleadings of his wife, he had resolved to burn "Qaïn," that masterpiece of his, had not De Heredia arrived at the critical moment and saved the poem. These details are given by Mme. Leconte de Lisle in an interview with a reporter of the Paris *Temps*.

Mme. Octave Feuillet has published reminiscences of no particular value under the title 'Quelques Années de ma Vie' (Paris: Calmann Lévy). There are some entertaining passages and allusions to certain literary events—such as (and mostly) the publication of her husband's novels or the performance of his plays—a good deal of description of her awe and admiration of Napoleon III. and the Empress Eugénie, for whom she seems to have entertained something of the feeling of Mme. de Sévigné for Louis XIV. This and an account of the dresses made for her by Worth are what strikes one most on reading the well-printed pages; and when the book is finished, one wonders at the very small quantity of matter which can be made into an octavo volume of nearly 400 pages.

The fourth number of the Boston quarto "quarter-yearly Review of the Liberal Arts called the *Knight Errant*, being a Magazine of Appreciation," rounds out the first volume in the space of two years. The editors frankly announce a want of material support, and will publish no more unless their Appreciation is appreciated at its worth in fine linen by a discerning public. The vagueness of the gospel of this magazine is as obvious at the end as at the beginning of its enterprise, and we cannot honestly say we think the sum of doctrine or of fancy which makes up the letter-press worth the cost of so sumptuous a product, whose artistic side has far surpassed the literary. Paper, presswork, and some of the photogravure illustrations have been admirable; but what sort of a Review have we had?

The third annual report of the Massachusetts Trustees of Public Reservations tells a meagre tale of gifts, as might have been expected from the dull, hard year. The document is valuable, however, for its appendix, which reviews the extent and condition of public holdings in the shore towns of the State.

In spite of political unrest and talk of disunion, special efforts are now being made by the Storthing to develop the railroad system of Norway. At the last session of Parliament a liberal initial appropriation was made for additions to the present system, aggregating 490 kilometres. From an article in a Swedish railroad journal it appears that, owing to natural causes, special difficulties present themselves, quite equalling those of the Swiss roads. Of particular interest, from an engineering standpoint, is a section 75 kilometres long, between Voss and Taugevand, near Bergen, which will connect with the trunk line Christiania-Bergen, one of the most popular of the Scandinavian tourist routes. The estimated cost of this short stretch is 14,500,000 kroners (say $4,000,000). It will require 11,464 metres of tunnelling, and 359,000 cubic metres of rock will be blasted. An important element in the running of this portion of the road is the snow, especially in the valleys. Numerous snow-sheds will have to be erected, and on the mountains watch-towers are to be placed at intervals of two and one-half kilometres. This new enterprise is only one of the many results of Norway's increasing popularity as a tourist land.

The *Annales de Géographie* for July opens with an account of the French colony of the Ivory Coast and the Sudan bordering it on the north, by M. Marcel Monnier. For the development of the abundant resources of the country labor alone is needed, and for this the only hope appears to be in the conversion of the negro to Mohammedanism. This propagandism, which is spreading gradually but irresistibly over western Africa, is less of a religious than an industrial nature. The black Mohammedans teach the natives to weave, to prepare skins, and to cultivate the ground, not for daily food merely, but to supply the markets with articles for barter. The manners of the savage are softened, his fetishism is given up, he abandons his hut of branches for a clay house built around a court-yard, and becomes, as it were, a useful member of society. The country contains considerable gold, which is found mostly in "pockets." These are emptied by black slaves, who carry the dirt to be washed to the nearest water, sometimes two or three hours' march distant. The quantity does not seem to be sufficient to cover the expense of European mining. M. Monnier went as far as Kong, an important walled town in the Sudan, and, writing of its great fair held every five days, corrects the exaggerated impressions which have prevailed of the extent and value of the commerce of these Sudanese markets. M. E. Blanc continues his description of the progress of Russian colonization in Central Asia, treating especially of the agricultural development of the country. Cotton is the most important crop, and, with the opening of the new line of railway connecting the Caspian and the Black Seas north of the Caucasus, will probably increase greatly in the future. One province alone, Ferghanah, now sends yearly more than two hundred million pounds over the Transcaspian Railway, or more than twelve times as much as the whole country exported in 1888.

The two sheets in Part 7 of Paul Langhans's "Deutscher Kolonial-Atlas" (Westermann) exhibit the German protectorate in Southwest Africa, and the spread of Germans and German interests in Europe—for which last several small maps are requisite.

From Dietrich Reimer, Berlin, we have the first part of a grand ancient atlas, "Formæ Orbis Antiqui," by Dr. Heinrich Kiepert, assisted by his son, Dr. Richard Kiepert, than whom two more competent authorities could not be named. The form is a large folio, and each map is accompanied by critical text, with references to the sources. Special attention has been paid to longitudes, altitudes, roads (in the Roman times particularly), and spelling of names of places. The scale of these maps is a delight to the eye. Our countryman, Ramsay, has a deservedly prominent place in the references regarding hither Asia Minor. The Aegean, northern Greece, Illyricum and Thrace, the British Isles and Spain, are the other maps in the first group.

The general diffusion of elementary education in Bavaria is evident from the fact that of the 26,383 recruits for the army levied in 1893, only six were unable to read and write. In France 6.43 per cent. of the recruits of the same year did not know the letters of the alphabet. In Saxony the percentage of the illiterate is slightly less, and in Würtemberg somewhat greater than in Bavaria. In Prussia the number varies considerably in different provinces, being smallest in Hanover (0.04) and largest in the districts beyond the Rhine bordering on France (4.01, a sudden increase over 1892, when it was 2.75). Posen also makes a bad showing (1.72) in comparison with Brandenburg (0.15), Westphalia (0.08), Silesia (0.57), Schleswig-Holstein (0.10), East Prussia (0.98), Pomerania (0.22), and Alsace and Lorraine (0.30).

The Russian Government has already decided to establish a medical school for women at St. Petersburg. This step acquires additional importance from the fact that only a few years ago the Ministry of Instruction was strongly opposed to every movement favorable to the higher education of women. The medical institution organized by Prof. Gerie for this purpose was closed in 1884, and all efforts recently made by this gentleman to revive it were utterly futile. The sudden and radical change of policy is due to the influence of Prince Wolkowski, whose excellent address delivered at Chicago during the World's Fair on the relations of intellectual culture to the State will doubtless be remembered by many Americans.

At the summer graduation ceremony of the University of Glasgow, held on July 26, the degree of Bachelor of Medicine and Master in Surgery was conferred on women candidates for the first time in the history of any of the Scottish universities. The two leading graduates in this new departure were Miss Marion Gilchrist, Bothwell, and Miss Alice Lilian Louisa Cumming, Glasgow. Both had been students at Queen Margaret College, now the Women's Department of the University of Glasgow, for seven years—three in arts and four in medicine, their clinical work having been taken in the Royal Infirmary and Sick Children's Hospital. The University degree in arts not being open to women at the time, Miss Gilchrist took in arts the general certificate of Queen Margaret College. She now appears on the University graduation lists as the third in rank of the six candidates who took the degree of M. B. C. M., "with high commendation."

—The *Atlantic* for September contains hardly anything very striking or attractive, although it maintains its usual unexceptionable literary tone. Perhaps the most original article is that on "Old Boston Mary," in which Mr. Josiah Flynt gives a picturesque account of an old gypsy tramp who used to live in a shanty in the outskirts of Boston, and contrives to invest with a good deal of interest a personage probably nothing but repulsive to those who met her in the flesh. "The Kidnapped Bride," by Mrs. Catherwood, is a story full of dramatic fire. Mrs. Kate Chopin has a story, "Tante Cat'rinette," which, as will be guessed from its name, is mostly in dialect. There is also a sprinkling of dialect in Grace Howard Peirce's pathetic sketch entitled "For their Brethren's Sake." "Rus in Urbe," by Miss Edith Thomas, although not much more than a collection of scraps, has many shrewdly humorous observations on a number of amiable human weaknesses. Those who cannot reconcile themselves to the Gallicism "It goes without saying," will read sympatheti-

cally a denunciation of it in the Contributors' Club.

—The best article in *Scribner's* is Mr. Crawford's description of Bar Harbor, which can be read with pleasure even by those who care nothing for the subject. He is here in his happiest vein, brimming over with good things, and shows himself master of the art of expressing effectively what, under less skilful treatment, would be commonplace—as when he speaks of "that mysterious tribe of people who look as if they could not possibly receive a dozen letters a year, and yet who are always assiduously looking out for them"; or, of "queer little dogs in which the absence of breed produces a family likeness." Carl Lumholtz contributes a second paper on the Tarahumari Indians, and contrives to crowd into a small space a great deal of curious detail about their customs and peculiarities. He devotes a considerable portion of his article to a description of their foot-races, in which he says there is more or less cheating, "especially if the Indians have become half-civilized." Thomas Nelson Page contributes the first half of a story, "Little Darby," treating of Southern life in his usual manner. "The Folly of Mocking at the Moon," by Gaston Fay, is a drolly absurd sailor-man's yarn about the sinking of the *Alabama* by the *Kearsarge*.

—The *Century* is a remarkably good number. It opens with an interesting article by Dr. J. M. Rice on "School Excursions in Germany," describing a seven days' trip taken by the school of practice of the Pedagogical Seminary at Jena last summer. This tour is described with much detail, with a view to introducing the custom among us. Like the practical man he is, Dr. Rice has already induced one American school to act on his suggestion, and gives an account of the experiment in the current *Forum*. Another article bearing on the same subject is that on "Playgrounds for City Schools," by Jacob A. Riis, who, after showing how poorly our public schools are provided in that respect, and how much need there is of a better provision, proposes that enough land be condemned around every school-house to make a small park and playground; but as he estimates that the scheme would cost thirteen millions of dollars, there is small hope of its realization. Mr. Joseph B. Bishop, in "The Price of Peace," after repeating the now familiar story of the blackmail levied by Tammany Hall on corporations, points the moral that the men who allow themselves to be blackmailed are in great measure responsible for the corruption of our politics. Prof. Woodberry brings out a second batch of Poe letters, ranging from 1839 to 1843, which throw some light on the literary manners and customs of the time, and furnish further evidence that Poe's habits of intemperance constituted the great obstacle to his advancement in his career. There are two good short stories—"Jake Stanwood's Gal," by Anna Fuller, notable for its energetic movement, and "The Whirligig of Time," by George A. Hibbard, which is a neat bit of parlor comedy. Mr. Timothy Cole's engraving of a painting by Gabriel Metsu should be mentioned, as also the frontispiece from a painting by Cecilia Beaux.

—About one-half of *Harper's* is given up to fiction. The brightest thing in it is Brander Matthews's "The Royal Marine," a sparkling novelette full of witty dialogue and amusing situations. It has some points of resemblance, but more of contrast, to Mr. Crawford's story in the *Century*. Mr. Matthews seems to produce his epigrams more spontaneously than his confrère, and has the advantage of seeing American society through the eyes of a genuine native. Apropos of the Bryant centenary, Mr. J. W. Chadwick gives an account of the genesis of "Thanatopsis," reprinting the original draft as written in the poet's seventeenth year and printed in the *North American Review*, and pointing out some of the emendations of the subsequent editions. Mr. Chadwick also suggests the literary sources of the lugubrious reflections on life and death which could not have been altogether natural to a boy of sixteen. Mr. Alfred Parsons writes of Japan as gracefully as he draws, and Mr. Julian Ralph describes primitive modes of life in West Virginia, which seem almost more remote from our civilization than do the Japanese customs. Mr. Caspar Whitney's "Riding to Hounds in England" will be welcomed by teachers of rhetoric who are anxious to offer their pupils fresh examples of "English as she should not be wrote." Here is one specimen out of many: "Horseflesh maintains a more universal aristocracy, for, as a rule, the average is about the same, each country requiring a standard which all endeavor to reach, whether to be in the vogue, or for the more practical purpose of living with the hounds."

—In 1837 Congress appropriated $30,000 to purchase from Mrs. Madison the "manuscripts of the late Mr. Madison." After the lapse of half-a-century the general public is permitted to know what was comprised in that purchase, and No. 4 of the Bulletin of the Bureau of Rolls and Library of the Department of State contains a calendar of the manuscripts. A cursory examination of its contents gives an exalted idea of the shrewdness of Mrs. Dolly Madison and of the simplicity of the Government officials who perfected the transaction. The "gold-brick" and "green-goods" exchanges are nearly similar, considered from the standpoint of the purchaser. We do not mean to assert that the sale was a job, but the Government was certainly taken in. The Attorney-General decided, many years after, that Mrs. Madison was entitled to what she had retained, but we marvel at the blindness of the official who dealt with her. The real Madison letters were scattered at auction two years ago. There is only one series of letters to Madison in the Department calendar worthy of note—the noble series of Jefferson letters. Turning to Washington, we find *copies* of five or six letters. The originals of many (nearly four hundred) unusually long and interesting letters from Washington, Pendleton, Edmund Randolph, Joseph Jones, John Armstrong, and others were scattered at the sale just mentioned, and could have been purchased for one-half the sum paid for the collection obtained in 1837. In historical value there could be no comparison between the two lots, and yet the Government made no effort to secure the more valuable letters sold in 1891.

—Was it a consciousness of inferior goods that led to a marked falling off in this issue of the Bulletin? In size, it is the largest yet made—upwards of 740 pages. The type is old and much worn, making an indistinct impression. The proof-reading has been done hastily, and is not intelligent. It is a mistake to take an endorsed name as conclusive, and servilely follow manifest errors in printing a proper name. A calendar is a guide, and it should be so prepared that the writer of a letter can be readily identified, and, above all, correctly identified. Such a list becomes a book of reference; otherwise it is liable to mislead and confuse. Compared with the great calendars of the English records, these issues of the Department of State are very imperfect, and this No. 4 is most imperfect of all. Opening at random, we note a few of the errors. Richard *Blond* Lee is mentioned on page 464, *Richad Blond* Lee on p. 598, and Richard *Bland* Lee (correctly) on p. 693. Surely he was sufficiently prominent in his day to merit a proper record. Bossauge, p. 164, is correctly printed Bossange on p. 205. It is not difficult to recognize Epaphras under the misprint Epapheas (p. 175). A little care would have prevented so many differences in spelling names. Battaile and Battoile (p. 154), Ballman (p. 9) for Bollman, Gilmore (p. 28) and Gilmer (p. 320), Hurlbert (p. 32) and Hurlbut (p. 367), Hanson (p. 349) and Hansen (p. 505), Dufret (p. 274) for Dufief, are some that are easily recognized. The same negligence occurs in initials. A. C. Cazenove (p. 202) is A. Cazenove on p. 13. G. Cardelli (p. 187) becomes Antonio Cardelli (p. 12), P. S. Chazotte (p. 204) is Stephen Chazotti on p. 13, and Eben Huntington (p. 366) is made Eberd on p. 32. Dates easily determined are omitted, and some curious instances of unfamiliarity with the history of the times may be found. The long letter of Jay, on p. 377, could have been addressed only to Congress. The date of the resolution of Congress (p. 278) should have been found in the Journals. We hope to see an improvement in No. 5, as it is impossible to estimate too highly the general utility of these bulletins.

—The more that esoteric Japan and the "profound peace" prior to this half of the nineteenth century are studied, the more do Japanese history and human nature appear normal. Riots and turbulent outbreaks were common, and an irregular and intermittent lawlessness was particularly rife in times of famine. In studying this period, Prof. Garrett Droppers met with an interesting form of credit institution, which he has treated attractively and luminously in a paper read before the Asiatic Society of Japan, and printed in volume xxii. of its Transactions. The founder was Ninomiya Kinjiro (born July 23, 1787, died 1856). Though a farmer, he overcame the prejudices of caste, and, in the service of various daimios, was enabled to reduce sensibly the horrors of famine and to raise up lapsed and bankrupt districts to prosperity and abundance. Not as a religious, but as a sober social, reformer, who believed in the unalterable laws of nature, his system, which suited admirably the feudal framework of society, was based on the idea that "we are strong because of social wealth bequeathed to us by the virtue of our ancestors, our state, and our parents." He had no place in his system for the individualism which characterizes the Westerner and this nineteenth century. Briefly stated, the Hotokusha (Compensation-Gifts Association) aims to realize a true social life. It furnishes relief to the poor and orphans, rewards meritorious actions, improves customs and furthers social morality, reclaims waste land, promotes irrigation and plants forests, loans money and pays interest on deposits. In not a few respects, it resembles the Raiffeisen Loan Associations of Germany. The idea of profit or dividend is kept out, and the element of gratuitous service is emphasized. The paper gives interesting proofs of the good working of the plan, which, despite the changed conditions of the country,

still accomplishes great good. Statistics showing 5,520 associations of all grades, with a total membership of 18,980, with capital, rice and grain stores, land, etc., are given. A bibliography for the Japanese-reading student is added, from which we learn that a monthly magazine to propagate Hotoku principles has been published in Tokio since 1892. The very existence of such a society, which loans money without demanding interest, and which does not invariably require security, is a strong proof of the excellent moral character of portions at least of the rural population of Japan.

## MR. GOLDWIN SMITH'S TRANSLATIONS FROM THE GREEK TRAGEDIANS.—I.

*Specimens of Greek Tragedy.* Translated by Goldwin Smith, D.C.L. Æschylus and Sophocles; Euripides. 2 vols. Macmillan & Co.

It is natural for the English University man to recreate himself with versions from the classics; and it is inevitable that the recreations of Mr. Goldwin Smith should be neat and dexterous, and successful—not suggestive of slippers and dressing-gown and the otiosity of self-indulgent old age. Every educated Englishman of a type which we trust is not destined to pass away has a right to such diversions; and few have a better right to publish the results than Prof. Smith. They are a graceful offering at an old-fashioned shrine. We hear that the fashion is passing away even at Oxford, which is now beginning to claim the title of practical; and so Prof. Smith, not feeling quite sure that "Beauty is its own excuse for being," expresses a hope that his translation may be useful in Canada and other regions where Greek is vanishing from the academical course. In the United States it is our nature to refrain from classical versions and diversions, or to keep them locked up in our desks, far from the ungenial frown of the man of business and the man of science, and the piercing gaze of the strong young eagle that has fledged its wings in the technical schools. We are rather ashamed to confess such peccadillos to an unsympathetic public; across the water they are unblushingly displayed in high places and are regarded with an indulgent eye. Yet how frivolous are these relaxations of a Lord Derby or a Gladstone, compared with the serious and elegant leisure of our Platts and our Murphys and our Peffers.

Prof. Smith's venture consists of certain choice passages and scenes from Æschylus and Sophocles which make up a small octavo of about 250 pages, and another volume nearly as large culled from Euripides. He has chosen what he personally liked best. He steers clear of the choric odes almost completely, because he found them very hard material to deal with. "Their dithyrambic character, their high-flown language, strained metaphors, and frequent, perhaps studied obscurity, render it almost impossible to reproduce them in the forms of English poetry"; nay, perhaps, they do not contain much of "the material whereof modern poetry is made."

This formidable description will suggest to the imagination of the plain Englishman certain bogies from which he must thank the translator for a merciful deliverance. It is a description not altogether inapt when applied to some choruses of Æschylus, but strangely wide of the mark if meant for those of Sophocles and Euripides. Of these it would be nearer the truth to say that their lyric style, their highly poetic diction, the variety and beauty of their melody and rhythm, make it difficult, if not impossible, to represent or suggest their charms in English. We are not speaking now of a syllabic reproduction of the Greek metres, for this, as Mr. Auchmuty has lately shown in his "Œdipus at Colonus," can issue only in a literary curiosity. We mean a genuine English equivalent for the Greek rhythms and poetry. This would certainly be a task for great technical skill combined with high poetic genius; and genius, as a rule, scorns this kind of labor. If any one is inclined to think the task impossible, he may be checked at once by recalling Mr. Swinburne's "Atalanta in Calydon," and still more by the haunting memories of his music in "Astrophel." Dryden and Gray in their "Pindaric" odes gave only a slender suggestion of that complex and varied harmony of movement which in the Greek choral ode veers and shifts with every changing breath of thought and sentiment and passion. But Mr. Swinburne can truly say of this very problem, "Solvitur ambulando." The author of "Astrophel" has shown that he can do what he likes with the English language, and make its rugged vocables dance to any tune he pleases. He could undoubtedly achieve the task which Mr. Smith, with commendable taste and caution, avoids. But he naturally prefers to set his own thoughts to his own music.

There is a good reason why the choral odes should, if possible, be reproduced for any foreign reader, namely, that they are an essential part of the total impression of the drama, and essential, therefore, to a clear apprehension of Greek dramatic art. They are often described as "the libretto of a chant"; Mr. Smith uses this comparison, adding that they must have "owed much to the melody and the movement of the dance." How much they owed to the music we have some means of judging from that skeleton of melody lately unearthed at Delphi. If we do not go so far as to say with Prof. Mahaffy that the Greeks were sorry composers, we shall at any rate agree that airs such as this, with all their exotic charm, served only as a slender and brilliant frame for the poetic picture of the words, setting them off certainly but never rivalling or eclipsing them, as the harmonies of an opera extinguish the libretto. In the opera and the oratorio the score is intended to eclipse the libretto; in the Greek representation, the poetry was first and foremost, the music was purely ancillary and subordinate.

We may repeat, then, that the odes are essential not merely as a record of the development of the drama, but as a matter of poetic art. They are often intended to create the mood of the spectator, to supply him with allusive information, to suggest or furnish contrasts or subtle harmonies with the situation that is unfolded in the dialogue. In Sophocles and Æschylus they are generally as necessary and inevitable as the pieces of mosaic in a picture; in Euripides they are more like the jewels worn by a beautiful woman—brilliant but casual and detachable. Yet even with Euripides, it would often be truer to say that they beget the mood, the ethereal atmosphere of emotion and sentiment, through which the spectator is to regard the action of the play.

If asked to name the most adequate bit of work in these volumes, we should lay our finger on that ingenious piece of special pleading between *Creon* and his son in the "Antigone," in which Sophocles, without forgetting his poetry, turns for awhile his audience into a court of law. The finesse and dexterity of this encounter are very much in Mr. Smith's line; and so is the "stichomythia" in which it issues—the flash and gleam, the cut and thrust and parry of responsive single lines, so dear to the Greek heart, and so alien, we may add, to the genuine English drama—so alien, indeed, that FitzGerald felt obliged to renounce it almost entirely. It is, however, an artifice well suited to Mr. Smith's epigrammatic faculty. Epigrammatic felicities are his peculiar gift and property. One might cull a very pretty garland of these from either of the volumes. For example, *Ismene's* warning to her sister:

> "Hot is thy blood, but chill thy enterprise";

and again:

> "High-vaulting virtue overleaps itself";

or this from *Heracles* to *Admetus*:

> "Time will bring balm; thy wound as yet is green";

or the messenger's word to *Œdipus*:

> "Thy name is thy misfortune's monument";

or the wish of *Hippolytus*:

> "Ne'er may wife of mine
> Be wiser than consorts with womanhood";

or this bit of skilful simplicity from a parting scene:

> "*Polyxena*: 'Mother, farewell; Cassandra, fare thee well.'
> *Hecuba*: 'Farewell who may; ill must thy mother fare.'"

Side by side with the discussion in the "Antigone," we should place the sonorous and eloquent defiance of *Prometheus*, and such speeches as the final address of *Athene* in the "Choëphoræ," where in point, vigor, and neatness Mr. Smith's version has the advantage even of Mr. Morshead's. We spare room for a few spirited and characteristic lines in which *Prometheus* reproaches the chorus for their submissiveness, and announces the approach of *Hermes* bearing an ultimatum from *Zeus*:

> "Cringe, if thou wilt, sue, bend the knee to power.
> Little reck I of Zeus. Then let him work
> His tyrant will for his allotted span:
> Not long shall he be monarch of the gods.
> But lo, the Almighty's henchman I behold,
> That errands bears for this new dynasty;
> His lackeyship must some new fiat bring."

The same felicity, with rarer qualities, characterizes the recognition scene between *Iphigenia* and her brother, and the touching passage, of legendary fame, in which *Electra*, beside the urn which she supposes to contain her brother's ashes, deplores his death and her own unfriended lot. Some lines in this go straight to one's heart:

> "Strange hands those rites performed, and thou art here
> A little dust clipt in a narrow urn."

And again:

> "Receive me now in that abode of thine,
> That, *dust to dust*, I may abide with thee"—

which is so neat that we hardly venture to hint its inadequacy for τὴν μηδὲν εἰς τὸ μηδὲν.

There are, however, inequalities in Mr. Smith's performance. He has his moods, and in some he can be prosaic, or suddenly lapse into prose. This may happen anywhere; but the long narratives of Euripides are perhaps the most trying ordeals. Euripides, if never downright prosy, often treads on the verge, in that even, pedestrian style by which he prepared the way for Menander. This level, easy manner, which reaches no great height of inspiration, and yet seldom if ever sinks to bald prose, is a test for an artist like Shelley—a test which he bears so winningly in the "Cyclops." It is a perilous undertaking to tell how "We were engaged in dressing down the steeds," or, of *Jason's* bride, that "Scarce her seat received her fainting form," and "What followed was appalling to behold," or, "A fearful struggle then ensued," without trans-

gressing into commonplace. The sentiment of *Menœcius*,

> "If each man freely would expend his store
> For the promotion of the common weal,
> Our states, from many a present evil free,
> Would see before them times of happiness,"

is honest, sensible prose, slightly disguised in the form of verse. Euripides is not entirely responsible for this, for in other passages our translator shows himself willing to part with a metaphor, or with a touch of color, which warms and vivifies the original. *Medea's* declaration, "My hand I will not weaken," is rendered, "My purpose is unchanged"; "The mistress whom we flatter in thy place" becomes "She who is now our mistress in thy place"; and the "dazzling white foot" of the bride (παλλεύκῳ ποδί) disappears in the descriptive line, "Paced gayly to and fro with dainty steps." These are certainly slight matters and not worth mentioning if they were isolated; our reason for mentioning them at all is that they reveal a tendency which is almost a trait.

On the whole, however, these versions must be pronounced a brilliant success in a field where Mr. Smith is, in some sense, only an amateur. We have lately had many good renderings of masterpieces done into prose; we have, for example, not to mention well-known English works, Prof. Palmer's 'Odyssey' and Mr. Norton's Dante—renderings so dexterous, so delicately close and true, so exquisite in literary quality, that they offer some of the charms of verse, and a fidelity in certain ways which verse can hardly approach. We have been told, in fact, lately, that this is the only safe way to translate poetry; that renderings in verse must of necessity be paraphrases, and must offend the modern scientific craving for accuracy. But, as Mr. Smith truly says, "Prose can never be an equivalent for poetry; therefore, we must run the risks of a translation in verse"; and as FitzGerald said of the "Agamemnon," "This grand play, which to the scholar and the poet lives, breathes, and moves in the dead language, has hitherto seemed to me to drag and stifle under conscientious translation into the living." If we ask Mr. Smith under what conditions we must make our experiment in verse, he replies, "We must translate as far as possible line for line; otherwise, in Greek, we lose the form and balance which are of the essence of Greek art"; and, as a matter of fact, he has generally bound himself by this rule. Here we encounter at the outset a difference of theory between two translators who agree in making the experiment of verse; and it may be worth our while to examine the results of each process.

## THE TSIMSIÁN LANGUAGE.

*Die Sprache der Zimshĭan-Indianer in Nordwest-America.* Von Dr. A. C. Graf von der Schulenburg. Braunschweig: Rich. Sattler; New York: G. E. Stechert. 1894. Quarto, pp. 24 and 372.

THIS large and typographically well-executed work deals with an Indian language which is spoken in two dialects by an interesting people of well-nigh 6,000 souls, resident upon the coast of British Columbia. The Tsimsián are subdivided into fifteen clans, and dwell in about as many compactly built villages along the seashore and along the lower course of the Nass and the Skeena Rivers. They are known to us under the name of one of their villages, Tsimsián, a name interpreted by "on the Ksián," *i. e.*, "upon the Skeena River." The littoral slopes from Vancouver Island up to the Alaskan border are intersected by a large number of fjords, which give ample protection to the enormous number of fish found there. Fishing is the main support of the Tsimsián Indians, who at the beginning of the fishing season desert their winter villages en masse and start for the fishing-camps.

Many of their customs testify to the archaic state of their civil institutions. Children inherit from the mother; the aboriginal totemic clan-system still prevails in full force in spite of long intercourse with the white race. There is, if observers have judged correctly, a middle class distinctly separated by customary law from the commoners, and still more so from the leading class, so that instances are rare in which individuals of the two popular classes have succeeded in making their way into the "upper crust." This implies an hereditary caste, which is seldom observed in Indian communities. The "religions" of the Tsimsián, or rather their ceremonial clubs or societies, are four in number; one of them is named "the dog-eaters," another "cannibals." Their chief deity is the sky, *lakâ*; subordinate to it are the celestial bodies, as sun and moon, mysterious beings beneficial to mankind (*neknók*). They are the mediators between heaven and man.

Attempts were made over twenty years ago to Christianize these people. In 1886 their missionary, William Duncan, removed about one thousand Tsimsián Indians to Annette Island, that they might remain free from corrupting influences, made their town, New Methlakathla, a centre of civilization by erecting a schoolhouse, a marketplace, a hall for meetings, a gospel and law building, and a house for lodging Indian visitors. To engraft the true principle of culture, he endeavored to make them active and industrious workers and producers, established manufactures of soap, rope, woollens, and shoes, the products of which are carried to the international market at Victoria, B. C., at stated intervals, by a schooner especially built for their use. The fact that these Indians find an immediate reward for their industrial exertions gives them a stimulus very different from that furnished by the dull agricultural work going on upon the Indian reservations in the United States.

The principal source of the above ethnography has been the English and German publications of the explorer Dr. Franz Boas of Minden, who was also the Count's chief authority for the Tsimsián grammar. The four Gospels, translated by Protestant missionaries into Tsimsián, furnished data for the grammar, and especially for the lexicon of about 2,800 words, which will be found at the close of the volume. In dedicating the work to his uncle, the deceased linguist Georg von der Gabelentz, Count von der Schulenburg pays a glowing tribute to his merits and achievements. His helping hand is discernible not only in particular statements, but in the plan of the whole work, which is probably due to his teachings. Another grammatical treatise on the same coast language, as yet unpublished, is that of Wm. Ridley, bishop of Caledonia. When its contents are arranged more scientifically and appear in print, linguists will have an abundance of material at their disposal.

Tsimsián forms a linguistic family by itself. Its phonetics are rather simple, and the words are by no means so jaw-breaking as those of the Selish and Kwakiutl dialects adjacent on the south. Words terminate mostly in consonants, and some vowels have an indistinct pronunciation, as in English, but are not nasalized. A tendency towards assibilation is perceptible; guttural consonants are numerous, but labials and dentals are not, and surd explosive sounds are largely in excess of sonant explosives. Consonantic accumulations are observed chiefly at the *end* of words. The principal parts of speech, nouns and verbs, are but imperfectly distinguished from each other. What we call a verb in European languages is in Tsimsián a noun-verb, or, more properly, a noun qualified by a pronoun, which, according to the context, has to be construed either as a personal or as a possessive pronoun. Dr. Boas states that the independent form of the possessive pronoun is identical with the nominative of the personal pronoun. This implies that the expressions *I speak* and *my word* have to be rendered by the same term in Tsimsián. This structure of the sentence is common to many American languages, and prevails, for example, throughout the whole Algonkin family. In the verb there are three main tenses, and some subsidiary tense forms, all expressed by temporal particles and not by verbal affixes, as with us. But the tense-particles of the main tenses are used also in inflecting the noun, and, moreover, the pronouns, as *you*, *we*, *yours*, *ours*, are inflected for tense also. There is no substantive verb *to be* which can be used as a copula; but our verb *to be* is often replaced by verbs approximating the above function and defining *space* rather than anything else—to stay, to remain within, to be in a certain medium, to be so and so, to have, to do. Where the verb *to be* is intended to mean real and not casual existence, the position of the words in the phrase or sentence will indicate it. Temporal particles qualifying a verb stand before it; when qualifying a noun, after it.

Marking absence and presence is a very important object in this and in many other Indian languages. When the verb is in the third person, the article *da* or *dada* has to be added to the noun when presence of subject or object is implied; *ga* or *gaga*, when absence (local or temporal) has to be indicated. The sense of localization and distance from the speaker is much stronger in Indian speech than that of temporal, causal, or any other relation. In some categories, as in the attributive relation, prefixion is the rule. Thus, the adverb stands before the verb and not after it, and the adjective used attributively precedes the substantive it qualifies. Derivation of words, when material and not logical relations are implied, is effected by prefixes, and the same prefixes form verbs and nouns indiscriminately. Personal and modal inflection is performed by suffixes. Plurals of nouns and plurals of verbs are formed in precisely the same manner, and reduplication enters largely into the formation of both. When the object of a transitive verb stands in the plural, the verb assumes the plural form also, no matter whether the subject of the sentence is singular or plural.

Numerals are a fair example of what Indians can achieve in linguistic specializing. The Tsimsián counting system is quinary-vigesimal, and the numerals are rather short when not lengthened by affixes. Cardinals and ordinals assume no less than seven different forms intended as classifiers, describing the shape of the objects counted. One series serves to count when no definite object is referred to. The second counts flat objects and animals, the third round objects and divisions of time, perhaps because the sun and the moon, measures of time, have a round shape. The adverbial numeral is also expressed by this third series. Another or fourth series is em-

ployed to count persons, another objects of long shape, another canoes, another lineal measures. Most of these forms are made by suffixion; so large a number is unparalleled in any other tongue, though many languages express as many or more classes by the addition of separate words.

Count v. d. Schulenburg has shown much assiduity in gathering a large number of texts with German translation, and if the quotations from the New Testament are in good Tsimsián, the collection may be trusted to afford sterling material for study. But translations of foreign ideas are never so valuable for linguistics as are aboriginal mythologic, ethnographic, and historic texts. Count v. d. Schulenburg was doubtless aware of this, and therefore inserted among his specimens several native productions, accompanied by an interlinear German translation. These specimens consist of a satiric song, three native prayers, an historic text referring to Inverness, B. C., and two mythologic pieces —in all thirteen pages, contributed by Dr. Franz Boas. Throughout, the Count avails himself of *two* systems for the notation of Tsimsián, viz., that of Dr. Boas and that of the Gospel translations. This is an almost irremediable mistake, for the differences are at times very considerable, especially in the vowel elements. That the Count never visited this part of the Pacific Coast in person becomes evident at the first glance, and in respect to phonetics he follows the statements of his authorities rather closely, and is never definite as to certain uncommon sounds of the language. The sign *lth* should not be adopted to mark the palatalized sound *l*. His statement that the suffix *th* serves to designate what is "definite" and "exclusive" cannot possibly be made out from the sentences given by him. His examples are sometimes too abundant, sometimes too scanty; the display of them in grammatic categories makes of his book a useful collection of phrases and sentences for grammatic uses, but it cannot be properly called *a grammar*. His own infrequent remarks cannot be regarded as establishing grammatic laws or rules. His classification of the forms of the plural is neither complete nor logical, and his remarks about conjunctions, particles, etc., are a rude jumble. The vocabulary is rich, but consultation of it is rendered difficult by the missionary practice of entering derivatives under their respective roots. For instance, *gumgaud*, to bless, must be sought under *gaud*, heart, sense. Only a few attempts are made in the Dictionary to point out the etymology of the words quoted.

Scientific interest in the Northwestern languages is awakening; we have already monographs on the Eskimo, Tlingit, Haida, Tinné, Niskwali and Klamath, and considerable lexical work has been done for Nez-Percé and for a dialect of Vancouver Island. The main desideratum is native texts describing tribal history, customs, and myths, correctly worded, explained, and commented upon. The Rev. A. G. Morice has done excellent work for three dialects of Tinné spoken in the upper parts of the Fraser River valley, and an annual report of the Bureau of Ethnology will soon bring Lower Chinook texts, gathered from the last living representatives found at the mouth of the Columbia River, by Dr. Franz Boas.

## TWO NOVELS.

*Poor Folk.* By F. Dostoyevsky. Translated from the Russian by Lena Milman. London: Elkin Mathews & John Lane; Boston: Roberts Brothers.

*Lourdes.* Par Émile Zola. Paris: Charpentier; New York: Dyrsen & Pfeiffer, B. Westermann & Co., and Brentanos.

It is interesting, in connection with this translation of Dostoyevsky's famous story, 'Poor Folk,' to recall briefly the circumstances of its first reading. Dostoyevsky, a young man, twenty-three years of age, had completed his course in the Engineers' Institute, and had entered the Government service, like his fellow-graduates. His dislike of this occupation led him, at the end of a year, to abandon it. He had no definite reason or plan of life, but was inspired to write 'Poor Folk.' His only literary acquaintance was Grigorovitch, who had published but one article at that time; and to him he gave his manuscript, that it might be shown to the poet Nekrasoff, who was making arrangements to print a periodical. Having given Grigorovitch his story, he spent the night with several friends rereading Gogol's 'Dead Souls.' It was the custom of the period for students to read and reread Gogol for the dozenth time whenever two or three chanced to meet of an evening. Returning home at four o'clock in the morning, in the brilliant daylight of a "white night" in June, Dostoyevsky sat down by his window, instead of going to bed, and was speedily summoned to the door by the ringing of the bell. Grigorovitch and Nekrasoff, unable to restrain their enthusiasm, had come to congratulate him on his work. Having begun with the idea that the perusal of ten pages would enable them to reach an opinion, they had been led on by interest and emotion to read the whole book aloud, and had taken turns as the voice of each failed. Nekrasoff's voice, they told him, had broken twice with uncontrollable feeling, as he read the description of the poor student's funeral. The next day Nekrasoff announced to the celebrated critic Byelinsky that "a new Gogol" had arisen. "Your Gogols spring up like mushrooms!" retorted Byelinsky; but by the evening, after reading the story, he was as much excited as Nekrasoff, and demanded that the new author be brought to him at once. 'Poor Folk' was published the next year, 1846.

As we read the simple, intensely pathetic story, told indirectly but with transparent lucidity in the letters of Mákar and Varvara, we cannot but share the feelings of the Russian readers and critics of half a century ago. The most elaborate attempt to depict squalid, hopeless poverty; the patient endurance of a wronged, ailing young girl; the kind heart, weak will, and magnificent unselfishness of a broken-down, witless old Government clerk, would be hopeless beside the power of this narrative contained in a series of letters so full of true art that their inherent artificiality never once occurs to the enthralled reader. Old Mákar Dyevushkin can watch the window of his distant relative, Varvara Dobroseloff, across the inner courtyard of one of those teeming tenement-houses whose dirt, discomforts, and queer occupants are lightly but surely described, touch by touch, in Mákar's attempts to convince Varvara that he is perfectly comfortable and undergoing no deprivations for the sake of supporting her. He rarely visits her, fearing that gossip will attack her, and that the world will not understand the pure and disinterested motives which impel him, wretchedly poor and addicted to drink, to starve and suffer in order that he may keep die in the poor young orphan girl, whose relationship to him is of the most distant sort, practically non-existent. As the ingenuous correspondence which takes the place of the inadvisable visits, proceeds, we penetrate the innermost recesses of these two hearts and characters, and of the hearts and characters of all the persons who are mentioned as side issues. At last Varvara marries the rich man who has wronged her in the past, and the story ends with a heart-broken wail from the old clerk who has loved her so faithfully and so disinterestedly. Where all is so perfect, it is hard to single out any passage for special admiration; but the episode, in Varvara's sketch of her life, of the student Pokrosky's funeral, followed only by his loving but degraded old father, is one of the gems of literature. It must be read to be even imagined.

The translation is delightful reading; the language is easy and elegant. But it certainly was not made direct from the Russian, and was made by a person who was ignorant of Russian localities and customs. The use of the German *j* (Djevuschkin, Jermolaev, Jermak) to represent the sound of *i*, or *y*, and the occasional rendering of the name Yemelyan as Emilius, and Aksentiy as Accentius, would seem to indicate that the German version served as original. The use of *child* in circumstances where the French would use *mon enfant*, of Eustace in place of Yevstafiy, and the manner in which the brief, forcible Russian sentences are rearranged or combined, are strongly suggestive of a French original, instead of the Russian. The translator's lack of practical knowledge of Russian leads to a loss of character. On page 5, Mákar writes of getting settled in his new lodging: "I have a bed, a table, a chest of drawers, *and some sort of curtains*." "I have hung up my saint's picture" is the national touch which Dostoyevsky wrote in place of the characterless phrase which we have italicized. "First vespers," instead of "all night" (vesper) service, is in the same category. Varvara tells how her family came from the country to live "in the neighborhood of Petersburg," and how they left that place for the "province of Vasiliev," and thanks Mákar for taking her to "walk on the island." It should read that they came to the "Petersburg quarter" (or ward) of the capital and removed to the quarter known as Vasily Island, and that Mákar treated her to the (for them) expensive luxury of a drive to "the islands," whither their weak health would certainly have prevented their walking as stated. Even people who are well never walk thither. "The cemetery at Volkovo" should read, "the Volkhoff cemetery." Several times the "Nevsky" (Prospekt), which runs at right angles to the Neva River, is mistaken for the river, and rendered, "the banks of the Neva," "by the Neva," "whether he lived on the Neva or on the quay." "On the Neva" means on the Nevsky Prospekt, and "on the quay" means on the Neva bank. "A money-lender who lives in Viborsko" should read, "who lives in the Viborg quarter" (of St. Petersburg). The word appears again, "I crossed Vibortski."

Instances of direct misunderstanding of the text are not rare. For example: "They punished me by making me take my meals in solitude," instead of "by giving me only one article of food." "I saw that he looked on me as his last hope, as it were, for he was engaged in a struggle, God only knows with whom," instead of "He spent his last penny on me, and struggled along himself, God only knows how." "My old lodging was no better than this one; it was but fairly comfortable," instead of, "To tell the truth, my old lodging was incomparably better than this one; it was more comfortable." "Why should I expect to have time for rest?" instead of "Why should we make a fuss?" "Coarse knitting-pins,"

instead of "yard-long knitting-pins." "It is her turn to suffer now," instead of "She will go to destruction." "The new wife turned everything in the house topsy-turvy; there was no living in it, and, moreover, she squandered all the money," instead of "She established her authority over all of them, and there was no living with her." "They change their governess every two years," instead of "This is the third governess they have had in two years." "Watergruel," instead of "Boiled buckwheat groats without butter." "But Sneguev, the porter, said I must not, for I should soil the brush, and the brush was a gentleman in Government employ," instead of "Snegireff . . . said, 'The brush, sir, belongs to the Government.'" A locksmith's apprentice is described as clad in a "stripped calatch," instead of "a striped kalat"; a calatch being a peculiar sort of wheaten roll, and a kalat, a long, loose coat, like a dressing-gown. Varvara's order that her handkerchiefs shall be marked "with tambour work, not with laid work," is translated, "On a frame, not in plain marking"—that is, evidently, not with pen and ink. The name Feodor is sometimes left in its Russian form, sometimes translated Theodore, which might indicate either a French or a German original; while the passage quoted from Ratazaev's absurd novel might have been mistranslated from any language but Russian. "Thou, my guiding star, hast led me so far, and for this even to the Stony Circle," should read "beyond the Belt of Stone"—that is to say, the Ural Mountains, which would have been appropriate to a Siberian love tale like that here referred to.

Mr. George Moore has furnished a very thoughtful and cleverly worded preface, which no reader of Dostoyevsky's story and no lover of Russian literature should fail to read.

Dulness itself is Zola's latest "novel," if such a name can be given to 'Lourdes.' There is no story whatever in the six hundred closely printed pages, for the ethereal loves of Pierre and Marie are so tenuous as to leave the reader absolutely cold. Zola is incapable of treating delicate sentiments; he neither feels nor recognizes them. His coarse, heavy touch crushes whatever is tender; his filthy imagination befouls whatever is pure. So there is no pleasure, no interest in the thin plot—so thin that it vanishes early. But one can do without plot nowadays, so many novelists and essayists and theorists have proclaimed that a story without a story, a bare, flabby, soulless thing, is the only true reproduction of life; so many authors have applied that doctrine and given us dialect instead of character, dreariness instead of excitement; therefore no one dreams of complaining of lack of plot in 'Lourdes.' But Zola has written some powerful passages in other days; the conflict of strikers and troops in 'Germinal,' the doing to death of the old man in 'La Terre,' the Weiss episode in 'La Débâcle' are examples that instantly recur to the memory. There is not one, absolutely not one, in 'Lourdes.' It is dull and dreary from beginning to end. Not the hospital train, conveying its load of horrors and miseries and credulities; not the torchlight procession of the numberless pilgrims; not the ecstasy of Marie followed by the supposed miracle, once inspires Zola to write with an approach to his old-time vigor. The repulsive diseases, the hideous wounds, the incurable sores, the putrescent horrors which the Virgin is expected to cure, are described with all the prosiness of detail and nauseating fulness which are naturally looked for from him; but out of this he has failed to evoke the powerful sensation of oppression, of horror, which alone could justify the catalogue. His characters are weak, shadowy, lacking consistence. Pierre, the unbelieving priest; Marie, the ecstatic girl, leave the faintest of impressions on the mind. The reader does not realize the wild fanaticism of credulous hope and superstitious belief which makes these thousands of sufferers abdicate the use of common sense and crowd to the spring from which their despair expects healing. The author has failed to penetrate the peculiar phase of mysticism which is exemplified in these strange pilgrimages, and it is not to be wondered at that Roman Catholics should feel angered; other believers and unbelievers alike merely feel bored. It does not really matter to them whether miracles are or are not wrought at Lourdes; all they know is that Zola's book is a painfully heavy report, badly digested, badly written, upon a generally sickening subject; all they wonder at is that a man of talent can deliberately perpetrate such a stupidity; all they enjoy is the thought that the numerous admirers of Zola's pornography will be bitterly disappointed also.

---

*Songs, Poems, and Verses.* By Helen Lady Dufferin (Countess of Gifford). Edited, with a Memoir and some Account of the Sheridan Family, by her son, the Marquess of Dufferin and Ava. London: John Murray. 1894.

Lord Dufferin, in his preface to this volume, promises that he will give a more detailed account of his mother's life with a selection from her letters. This promise will, we hope, be shortly carried into effect, for the letters of so remarkable a woman must be of great interest. Lady Dufferin was the daughter of Thomas Sheridan, and the granddaughter of Richard Brinsley Sheridan. Of the latter, Lord Dufferin says that the Life yet remains to be written, and that hitherto "no famous man has been more unfortunate in his biographers." He considers that Brinsley Sheridan derived from his mother, who was Miss Chamberlaine before her marriage, "the divine spark which converted the mere talents he may be supposed to have inherited from his father into the genius which made him famous." Mrs. Sheridan wrote two novels and two plays. One of the novels, 'Nourjahad,' was praised by both Mr. Fox and Lord North. Mrs. Sheridan's play "The Discovery" was a favorite with Garrick, and when Brinsley Sheridan's play of "The Rivals" was running at Covent Garden, Garrick was acting in "The Discovery" at Drury Lane; so that, to quote Lord Dufferin's words, "two pieces, by the mother and the son, were being acted at the same moment at the two great London theatres." He adds (p. 17):

"Sheridan opposed the war with America; he deprecated the coalition between Fox and North; he advocated the abolition of slavery; he denounced the tyranny of Warren Hastings; he condemned the trade restrictions on Ireland; he fought for Catholic emancipation; he did his best to save the French royal family. He was also in favor of an eight-hours day."

Sheridan married Miss Linley, the daughter of a musician at Bath. Her beauty is preserved in her portraits by Romney, Gainsborough, and Reynolds. Lord Dufferin says that "one bishop called her the connecting link between a woman and an angel; and another said that to look at her when singing was like looking into the face of a seraph." Reynolds painted her as Saint Cecilia, and he introduced her portrait in his figure of Charity in the painted window of New College Chapel at Oxford. Thomas Sheridan, the father of Lady Dufferin, married Miss Callander, who was as remarkable for her "firm character and abiding sense of duty" as she was for her beauty. Lord Dufferin gives this anecdote of his grandfather: "One day his father, remonstrating with him in reference to some matter, exclaimed, 'Why, Tom, my father would never have permitted me to do such a thing!' 'Sir,' said his son in a tone of the greatest indignation, 'do you presume to compare *your* father to *my* father?'" From the Sheridans Lady Dufferin inherited wit, humor, and gayety. Lord Dufferin says: "The Sheridans, though they fell afterwards upon evil days, were originally an ancient, affluent, and important family," possessing "the Sheridan Country" in the County Cavan. He attributes their "continuous intellectual activity" to the persecutions of Fate which beset them for two hundred years. Literary ability appeared in every branch of the family. A great-nephew of Richard Brinsley Sheridan, Joseph Sheridan Le Fanu, when a child, wrote in a few lines an "Essay on the Life of Man," which ran as follows (p. 22):

"A man's life naturally divides itself into three distinct parts: the first when he is planning and contriving all kinds of villany and rascality. *That is the period of youth and innocence.* In the second, he is found putting in practice all the villany and rascality he has contrived. *That is the flower of manhood and prime of life.* The third and last period is that when he is making his soul and preparing for another world. *That is the period of dotage.*"

Lady Dufferin was one of a family of three daughters and four sons, all remarkable for beauty and talent. Her sisters were the Duchess of Somerset (the Queen of Beauty at the Eglinton Tournament) and Mrs. Norton, whose novels and poems are well known. When very young, she married Commander Blackwood, R.N., afterwards fourth Lord Dufferin and Clandeboye. Her only child, the present Marquess of Dufferin, was born in Italy a year after her marriage, and to her husband and her son Lady Dufferin devoted the whole force of her affectionate nature. The best of her verses were addressed to them.

Some of Lady Dufferin's songs, such as "The Irish Emigrant" and "The Bay of Dublin," are known all over the world. She was acquainted with nearly all the distinguished writers of her time, including Lord Beaconsfield. Her acquaintance with the elder Disraeli was delayed, owing to a quarrel between the father and son, but at length they arrived together, and Lord Beaconsfield, "setting his father down on a chair and looking at him as if he were some object of *vertu* of which he wanted to dispose, . . . said, 'Mrs. Blackwood, I have brought you my father. I have become reconciled to my father on two conditions: the first was that he should come to see *you*—the second, that he should pay my debts'" (p. 59).

In 1862, just at the time of her son's marriage, Lady Dufferin married the Earl of Gifford, the eldest son of the Marquess of Tweeddale. Lord Gifford, who was many years younger than Lady Dufferin, had been devoted to her from a boy; he was now dying, and she consented to the marriage in order that she might devote herself to his comfort and relief. Two months afterwards he died. A few years later she was attacked with cancer. An operation gave her hope of a cure, and for a short time she seemed more than

ever "filled with the delight of living." But the disease soon returned, and her one desire was to conceal from her son her own conviction that the symptoms were fatal. She would not speak to him of her condition, but she wrote a diary for him to read after her death, in which she poured forth her feelings. The following passage relates to her departure from Clandeboye, when the return of her illness had just been discovered (p. 99):

"That last day at Clandeboye was full of sweet and bitter thoughts to me. I walked round the lake and took leave of all the old (and new) places. I sat upon the fallen tree at 'the mother's seat,' and looked long at the Tower. . . . May all those objects be pleasant memories to you. I had a poignant thought of regret in thinking I should see them no more (at least with my earthly eyes), for I have occasional happy fancies of some sort of spiritual presence with those we love that may be permitted after death, and, if so, how continually I shall be with my darling—alone or in company—in your walks or by your fireside—the fervor of my love, my blessing, my whole soul will surely encompass you."

Six months later, in June, 1867, Lady Dufferin died.

---

*The Ethics of Hegel:* Translated Selections from his 'Rechtsphilosophie.' With an Introduction. By J. Macbride Sterrett, D.D., Professor of Philosophy in the Columbian University, Washington, D. C. Boston: Ginn & Co.

MORAL philosophy is itself exposed to two opposite moral maladies, for ethical research begins only after we find we are already practically committed to moral positions. If, then, in this research, honesty, benevolence, courage, decency are to be seriously called in question and submitted to debate, how will it comport with any man's social obligations to take part in the examination? If, on the other hand, the investigation means less than that, what is it, after all, but a white-washing commission, a merely formal inquiry arranged to reach a foregone conclusion? Logicians may squirm in between the horns of this dilemma; but certain it is that they indicate two real, two reallest, dangers that beset the student of ethics.

One cannot well deny that Hegel sins in the latter of these ways. He tips us the wink at the beginning of each of his books, to let us know that he is all right. His personal history shows the same thing. His philosophy had to square itself with the Lutheran Church, under penalty of not being adopted as the Prussian philosophy of state. All the right wing of the school (who were the most consistent of the Hegelians) struggle to make it appear that Hegelianism is eminently Christian; and it is true that Hegelianism is, in some points, in striking accord with the sort of metaphysics which prevailed in the ages that formed the creed, and, further, that the precepts of the Gospel, as softened by modern glosses, are not without some resemblance to Hegelian ideas of the conduct of life. But that is all. Nor does the second malady protect Hegelian ethics from the first. For, after having immorally pledged himself not to disturb Christian ideas, Hegel betrays his confiding disciple in this respect. Christianity, namely, purporting to be based on historical facts and personal experiences, demands unquestioning fidelity to certain *sentiments*, while Hegelianism is one of the least sentimental of doctrines, and, whatever sentiments it may approve, approves as a part of a system with a singularly raw and chilly approval. In short, Hegelianism has too much Hegel in it to be in any hearty accord with the spirit of Christ. It would perhaps be too much to demand that, in rising from the perusal of a treatise on morals, we should find ourselves spiritually nourished. Certainly, the 'Rechtsphilosophie' is a repast of bran.

The book of selections before us is by a Christian minister, and is intended to impart to college undergraduates such slender notion of the Hegelian ethics as is consistent with their acquainting themselves with all the other principal ethical theories in the limited time and with the immature powers they can bring to that study which, beyond all others, calls for wisdom and for rumination. Whether under the circumstances the author accomplishes what was to be expected of him is a question that must be answered in the light of the above considerations. Dr. Sterrett appears to be, among that little company of thinkers who have been swept out of the mid-stream of the world's thought and caught in the side-eddy of Hegelianism—all of them having narrow enough horizons—the one whose discipleship is the most slavish. Such a worship is unjust to Hegel—it is almost a libel upon him, because Hegel would be the first to perceive, if he were here to-day, that the logic of history had weighed his system in the balance and found it wanting.

How ethics ought to be taught depends very much upon whether it is to be made one of the earliest studies of the college curriculum or one of the latest. It is to be presumed that such works as compose Prof. Sneath's "Ethical Series," of which this volume is the second number, are to be studied in the last year. The student will, therefore, already have heard something about the Hegelian philosophy and have had a dip into the Hegelian logic. With such preparation, the exposition of Hegel's ethics here given by Dr. Sterrett ought to be intelligible enough, and will enable the student to gain an *unreflective* acquaintance with that system in some detail. Without previous information, the student would be at sea.

About two-thirds of the volume is taken up with extracts from the 'Rechtsphilosophie,' accurately and well translated, and an abstract of the introduction to the work. The other third supplies bibliography, biography, exposition, and comparison with *previous* systems. The idea of the series seems to be that, since Hegel, nothing of any importance has been written about ethics, for we are told it "at present will include six volumes" on Hobbes, Clarke, Locke, Hume, Kant, Hegel. A college student who should be led to believe that in studying these writers he was studying what was most important in the history of ethics, would, we need not say, be duped.

---

*On Short Leave to Japan.* By Capt. G. I. Younghusband. Sampson Low, Marston & Co.

THIS British officer, of whom we have heard in Mantchuria and Burmah, presents as the apology for his hardihood in inflicting "yet another book on Japan," that "the latest news of so interesting a country may not be altogether unacceptable." The fresh news he offers is almost wholly in the seventeenth and final chapter, in which he describes, from some actual observations, the army of Japan. He travelled over the beaten tracks, and relies on Chamberlain's 'Things Japanese' and the same author's 'Murray's Hand-Book,' with Mitford's 'Tales of Old Japan,' for perspective and information. He serves up the familiar jokes, Anglican criticisms on Americans, and commonplace reflections upon things which have been described, almost monthly, in book-publications in some European language since 1875. The penultimate chapter will be of interest to Englishmen at home or in India, because of its detail of expenses and hints on travel in the islands.

In the chapter on the Japanese army we have, not an echo, but a clear tone, and the judgment of this military expert is of special value at this time. Under the system of universal conscription in vogue for over eighteen years past, service with the colors is for three years, then nine years in the reserve, and then a last resting-place in the territorial army till the day of final absolution from military service. The age of conscription is from seventeen to forty. The Japanese army now numbers 228,848 men of all arms, or 113,229 in the reserve and 53,187 in the territorial division. The peace strength, therefore, is 56,589, and this, the author thinks, "is the number that may be calculated upon as available for extra-territorial campaigns." Naturally the short-legged Japanese are compared with the Goorkas of the Indian army. The author praises the cleanliness of the barracks and the wholesomeness of the rations. He goes into enough detail of rank and pay, rate of promotion, etc., to give one a good idea of the *morale* of the force, which seems to be excellent. In describing the Murata rifle, the author must have had before him one of the non-repeaters, for the standard arm is a magazine gun carrying ten cartridges. With the infantry drill and bayonet exercise he was well pleased, but, like almost every foreign critic, he has only strictures for the cavalry. Organic causes enable the Japanese to be a better foot-soldier than cavalryman. "Equitation, many maintain, is an inherited quality. Generations of riders beget sons with legs long in proportion to their bodies, and so formed as to fit readily to the horse's back." Added to the thick thighs and short legs of the Japanese men are the heavy shoulders and bull-dog necks of the horses, which are seldom over fourteen hands high, have little speed, are wanting in hardiness, and trip violently even at a walk. Foreign horses have not yet been successfully acclimated. Hence the cavalry is the weakest arm of the service, and the full proportion for the colors has never yet been attained. Capt. Younghusband is all astray, however, when he says, "In all the history of the past, we have not yet been able to find an allusion to cavalry," etc. On the contrary, large bodies of mounted horsemen have taken part in the battles of the great civil wars in the middle ages and even down to the sixteenth century. Both picture and text in native literature are voluminous on this subject. Some interesting discussions concerning a possible war with China follow, the author urging that Japan is worthy of cultivation as an ally of England.

---

*The Historic Episcopate.* By Charles Woodruff Shields, D.D., LL.D. Charles Scribner's Sons. 1894.

*English Orders:* Whence Obtained. By the Rev. John Bainbridge Smith, M.A. London: Skeffington & Son. 1893.

IT is Dr. Shields's opinion that the chief lesson of the Chicago Parliament of Religions was the necessity of Christian harmony and unity in order to establish the supremacy of Christianity throughout the earth. "Let that lesson go unheeded, and the Christian religion may only have exposed its weakness in the face of its enemies." Dr. Shields's basis of

"harmony and unity" is that of the Lambeth Conference: The Bible as the Ultimate Rule of Faith; The Apostles' and Nicene Creed; Baptism and the Lord's Supper; The Historical Episcopate. The most weight is put upon the last of the four corners of the house. The others would, of course, exclude the Roman Catholics and all the liberal sects, but that could not be helped, and Dr. Shields permits himself a hope that on either side these might approximate to the Lambeth quadrilateral. Exception is taken to Dr. Briggs's "union by confederation," and also to Dr. W. R. Huntington's "union by consolidation," *i. e.*, by absorption in the Episcopal Church. Indeed, Dr. Shields is very careful to make out that his scheme will not be in any special way advantageous or glorious for the Episcopalians.

His own method is that of "unification by organic growth." In his endeavor to explain it he is extremely vague, his predicates tending to identity with his subjects in a treadmill fashion—motion without advance. The nearest approach to anything practical is a kind of double ordination, at once episcopal and presbyterian. The whole discussion has a far-away look, and a blind side for the forces that are operating powerfully and destructively on at least two of the four Lambeth propositions, those relating to the Bible and the creeds.

Mr. Smith's little book 'English Orders: Whence Obtained' is an interesting and amusing comment on the course of Dr. Shields's 'Historic Episcopate.' It is a laborious attempt to trace the line of English Episcopal consecration from the earliest times. Its object is to show that the present archbishops and bishops of the English Church undoubtedly and all but exclusively trace their orders to a Roman source. But this conclusion is not meant to operate in favor of Roman jurisdiction, for it is shown that this was not completed until the time of King John. That it should reach its term in Henry VIII. was a bit of poetic justice that could hardly be excelled. Mr. Smith is at great pains to make out a valid consecration for Elizabeth's Bishop Parker, and it would be churlish at this remove to refuse him and others the comfort which his argument involves. It is interesting to notice that had the Restoration of 1660 been delayed a little longer, the Anglican episcopate would have come to an end, and oh the difference to Pusey and other sticklers for the apostolical succession! The last of the bishops of Charles I. died in 1670.

Mr. Smith's patient compilation does not stand merely for some idiosyncrasy of his own mind. It is an expression of a widespread and deep-rooted sense of the importance of the episcopate as something sacramental, magical. The disinclination of all those who have this sense to any such policy as that suggested by Dr. Shields would be immense, and hardly less that of the average Presbyterian, loyal to the traditions of his church. And some, we are convinced, will find it smacking more of ecclesiastical ambition and the fear of modern thought than of the desire of common work for moral and religious ends. Dr. Shields is undoubtedly right when he asserts a growing tendency to the ecclesiastical spirit. It rejoices his heart. Others will be differently affected.

---

*Ricerche intorno alla Vita e alle Opere di Giambattista Cima.* Conegliano, 1893.

THE Italians of to-day, like their Roman ancestors, may be described as a race with a passion for monuments. Having filled their cities, towns, and villages with statues of Victor Emmanuel and Garibaldi, those communities which have had a painter of renown among the number of their citizens are taking every opportunity to remind themselves and the universe of this fact. Last year Borgo San Sepolcro unveiled a monument to Pier dei Franceschi. Bassano is erecting one to Jacopo da Ponte; and Conegliano, not to be left behind, has put up a neat tablet in the arcade of its town-hall to the memory of Cima, and, what is more to the purpose, has published a monograph containing a great deal of fresh information about this strenuous painter. All praise is due to the compilers of this work, Signori Botteon and Aliprandi, for the diligence with which they have searched through their own archives, and for their abstaining from the dithyrambic language too frequently indulged in by Italian municipal critics.

The fresh documents prove conclusively that Giovanni Battista Cima was born and brought up at Conegliano, and not, as Messrs. Crowe and Cavalcaselle supposed, at Udine. It was doubtless this ill-founded supposition that led these critics to see Friulan crudities in works of such classic Venetian merit as the "Madonna and Saints" of Vicenza, or the "St. John" of Santa Maria dell'Orto at Venice. The date of Cima's birth can now be put no later than January or February, 1460, for his signature is found in a document of 1474, and, according to Venetian law, a male attained his majority at the age of fourteen. Cima, it appears, was the family name of the painter, and not, as Boschini imagined, a fatuous pun on his own conceit, nor, as Messrs. Crowe and Cavalcaselle fancied, a reference to Cima's putting mountain peaks (*cime*) in his backgrounds. The painter seems, however, to have been the first to use this form of the name, shortened from Cimatore (cloth-shearer), a name derived from the trade pursued by his ancestors for at least two generations.

Cima did not leave Conegliano definitely until 1489, although the picture at Vicenza of that date proves that he must have had his training and formed his style at Venice. From that date until 1516 we find him living in Venice, twice married, having had two sons by his first wife, and three sons and three daughters by the second. In 1516 he returned to Conegliano, settling down comfortably in the house left him by his father, a house still existing. He died intestate no later certainly than September 1, 1518, and probably a year earlier. He did not, therefore, die young, as Vasari says, although he seems to have been just at the height of his powers as a painter. In no other work do his qualities appear more attractive than in his last, the one in the Brera representing St. Peter enthroned. This picture is even more porcelain-like in the coolness of its tones, is even more transparent in the shadows and firmer in drawing, than the other works of this uniformly excellent master. What he would have done had he lived longer, whether he would, like Catena, have felt the kindling glow of Giorgione, are questions one cannot help asking.

The catalogue of Cima's works contained in this monograph is by far the most complete in existence. Unfortunately, however, it is of no great value, as it has not been compiled by carefully trained connoisseurs, and the authors have not so much as seen many of the pictures described. But, to compensate for this, we have detailed accounts of the history and vicissitudes of the more important works. Particularly interesting are the documents relating to the "Incredulity of Thomas," and its history down to the date of its acquisition by the National Gallery. Until 1818 the picture remained on the altar in the Church of San Francesco at Portogruaro, for which it was painted, but in that year it was sent to Venice to be restored. There it remained until 1833, having had in the meantime a narrow escape from destruction by flood, when it fell and lay in salt water for some hours. Scarcely returned to Portogruaro, the altar-piece began to show signs of peeling off, and in 1852 it was again sent to be retored. This proved useless, as it immediately began to peel off again. In 1861 Sir Charles Eastlake saw it and offered forty thousand francs for it, but the question of proprietorship prevented its sale. It was finally bought for the National Gallery—of course not for the British Museum, as the authors say—by Mr. Boxall, for £1,800, and "in the British Museum they now show visitors what English gold could do to rob Italy of so precious an art treasure."

This monograph cannot be regarded as a final work upon Cima. It makes no attempt to recreate his artistic personality, nor does it try to connect him with the art movement of his time, though it is in this connection that Cima is particularly interesting. Why it is that Sebastiano del Piombo signed himself as a "pupil of Giovanni Bellini" on a picture which betrays no influence but Cima's, is a problem that still remains to be solved. Morelli's supposition that Cima must have been for some time the foreman of Bellini's workshop seems a likely one, but it needs corroboration. Cima's influence on such a fascinating artist as Catena, and on one so sympathetic as Lotto, was certainly considerable, and if all such points were carefully worked out, we should probably find that Cima was more than a mere painter of severe Madonnas and ascetic saints. But the monograph of Don Vincenzo Botteon and Doctor Aliprandi has at least the merit of making an elaborate study of Cima much more fruitful than it could have been hitherto.

## Outlines of the Syntax of Mood and Tense in the Latin Finite Verb.

By WM. GARDNER HALE, Professor of Latin in the University of Chicago. About 80 pages.
*In press.*

These "Outlines," which embody the results of many years of historical and comparative work, including those of a number of unpublished papers, cover very nearly the entire field of usage of the finite verb, with illustrations selected, as far as possible, from the authors generally read in the preparatory schools and the first two years of college study. The usages of the subjunctive are divided, as they have not hitherto been, into families of related constructions determined by comparative study of Latin, Greek, and Sanskrit, each family forming a chapter by itself. The descent of each construction from the modal force common to the entire family is sketched. The indicative is treated with similar care. A table at the end exhibits the entire apparatus of constructions, grouped by families, the relation of corresponding dependent and independent constructions inside the families being exhibited to the eye through the placing.

**GINN & CO., Publishers, Boston, New York, Chicago.**

# YALE MIXTURE.

# SELWYN HALL,

**READING, PA.**

*A MILITARY SCHOOL FOR BOYS.*

$400 a year. Thorough teaching and training. Classical, Scientific, Business, and Preparatory Departments; New Gymnasium: Athletics encouraged; small and large boys in different buildings; plentiful supply of pure water from mountain springs; buildings heated by steam, lighted by gas and electricity, and supplied with hot and cold water. School connected by telephone with Reading and neighboring cities. Scholastic year begins September 12, 1894.

*The* BISHOP OF CENTRAL PENNSYLVANIA *writes:* "I have had intimate knowledge of the condition of this school through the twenty years of its existence, and I feel no hesitation in saying that it has never been more worthy of patronage than now. Its discipline, its instruction, its comforts, its healthfulness, its influence on the character of its pupils are all admirable."

*The* HON. THOMAS F. BAYARD *of Delaware, Ambassador to England, writes:* "It gives me pleasure to affirm my high opinion of Dr. Samuel W. Murphy's capacity as an instructor, and fitness to control and educate boys. As my own son and the sons of my friends have been his pupils, I am the better enabled to bear this testimony."

*The* HON. GEORGE W. PECK, *Governor of Wisconsin, writes:* "The improvement of my son while under the charge of Dr. S W. Murphy for two years has been all that I could wish. I have no fear but that the boys who go out from under his charge will be young gentlemen, with an education that will be of use to them through life. The military part of the instruction is doing all of the scholars good, making them prompt, obedient, and balanced, in fact *gentlemen* as well as *scholars.*"

WILLIAM PEPPER, M.D., LL.D., *Provost of the University of Penn., writes:* "I am entirely familiar with the record of the students whom Dr. S. W. Murphy has sent to the University of Pennsylvania It gives me much pleasure to say that they were *thoroughly well prepared* at their entrance examinations, and that they proved themselves excellent scholars throughout their course at the University."

*The* REV. GEO. WILLIAMSON SMITH, D.D., LL.D., *President of Trinity College, Hartford, Conn., writes:* "It affords me great pleasure to have the opportunity of testifying to the high character of Dr. Murphy as a teacher and disciplinarian. The students sent to Trinity by Dr. Murphy have done credit to his work by their exemplary conduct, gentlemanly bearing, and good scholarship."

For full information and Catalogue of Selwyn Hall, apply to
DR. SAM'L W. MURPHY, A.M., Head Master.

**LAW SCHOOL.**

## HARVARD UNIVERSITY.

*Terms of Admission after 1895-96.*

# The Nation.

*NEW YORK, THURSDAY, SEPTEMBER* 13, 1894.

## The Week.

THERE will be no business revival in this country for several years to come if the Republican campaign orators and managers can have their way about it. One by one they are taking the position that there cannot and must not be a return of prosperity till the Democrats are put out of office. This was the burden of ex-Speaker Reed's "keynote," struck a few weeks ago, and it is the burden of that struck by Mr. McKinley at Bangor on Saturday. Ex-President Harrison has not struck his formal "keynote" yet, but the few guarded observations that he has permitted himself to make have all displayed an undertone of hostility towards good times and prosperity which shows that he has his eye on those un-Republican and un-American manifestations, and will join with the other statesmen of his party in rebuking and suppressing them when the proper time comes. Mr. McKinley agrees with Mr. Reed that the present tariff bill is not a finality, since "it is a settlement which does not settle anything," and he takes the ground that the only way by which to make it a finality till the end of Cleveland's term is to elect a Republican Congress this fall. A Democratic victory, he says, would mean "further and longer steps in the direction of free trade—deeper cuts and more deadly blows upon our industrial life"; while a Republican victory would mean that, "during the closing half of Mr. Cleveland's administration, the enemies of the protective system will be unable successfully to wage war upon the prosperity of the country"—meaning the prosperity of the past as it existed under the blessed McKinley law.

---

Senator Jones's withdrawal from the Republican party is followed by the announcement, in the columns of the New York *Press*, that Senator Dubois intends to follow his example unless the next Republican national convention shall declare for the free coinage of silver at the ratio of 16 to 1. This means free coinage without reference to the policy of any other nation. The Senator from Idaho says also that if the Republican party does not come up to the mark in 1896, Senator Teller of Colorado and several others will go the same way. These outgivings have a good deal of significance in a political way. The *Press* itself views them with great alarm. This paper is founded upon the idea that the American people, although possessing the richest country on the globe in respect of natural resources, cannot make a living without a tariff, and consequently it is almost pallid in the presence of this secession of the rotten boroughs that were brought in as States in order to maintain the Republican majority in the Senate. It appeals to them to consider "the recent utterances of Republicans like Reed, Lodge, Hoar, Cameron, and others." It says that the movement towards free coinage in the East is slow, but it is in the right direction. It admonishes the party in the East to consider "the vast dimensions of the injury that has been inflicted upon the West by the demonetization of silver and the constant appreciation of gold"; all these remarks being suggestions that a fifty-cent piece ought to be declared equal to a dollar.

---

As to declaring for free coinage by separate action on the basis of 16 to 1, the Republican national convention is quite as likely to pass a resolution endorsing the Wilson tariff bill. Such a step would snuff out the party in most of the states east of the Mississippi River, and would gain nothing west of it that they have not held heretofore. Under such circumstances party necessity and party wisdom alike require that these rotten-borough Senators, who are Populists at heart, should be told in their own expressive language to "vamose the ranch." Their departure cannot be long delayed in any case. Therefore they should be ushered out with no more ceremony than ordinary politeness requires. The country will be much benefited by having all the free-coinage men in one party, instead of hanging on the skirts of two parties and giving direction to both. It has cost the nation upwards of four hundred million dollars to cater to the silverites without really pleasing them. Now let them "flock all alone," and let us see how many people really want a fifty-cent dollar.

---

While national issues were the controlling ones in the recent election of a Governor and Legislature in Vermont—according to the absurd fashion in such cases—there seems good reason to believe that the great Republican majority, which has never been equalled in any other year midway of a Presidential term, was in part due to the refreshing contrast between the character and methods of the Republican candidate for Governor this year, and in the two previous gubernatorial contests. Both in 1888 and in 1890 men were nominated who, to quote the words of the Rutland *Herald*, "would never by any possibility have been dreamed of as candidates in anything like a close State, but managed to get the support of nearly all the party men who direct the State machine." Both were men who had a good deal of money and who were ready to spend it in the many ways, short of downright purchase, by which it is possible to interest the men who "run the machine" in carrying caucuses and conventions. Neither had any hold upon the masses of the voters, and in each case there was much resentment among independent-minded Republicans at their success. This year, on the other hand, a man worthy to be Governor was made the candidate without a resort to crooked or questionable methods, and every Republican in the State felt that his nomination ought to be endorsed. The small Republican majorities in 1890 and 1892, and the large majority this year, therefore, all indicate the healthiness of public sentiment in a State so one-sided politically as Vermont.

---

The Ohio wool-growers met in annual convention for the thirtieth time last week, and we do not wonder that they were filled with impotent rage as they contemplated the fruit of their labors for a generation. In 1867 they succeeded in getting monstrous duties laid for their benefit, only to see them lowered in 1883. Then they persisted in exacting the uttermost farthing from McKinley in 1890, with the result of stirring up such indignation against them that they are now left without any protection at all. Meanwhile the price of wool has been steadily going down year by year. For more than a year the laws of trade have been setting protection on wool at defiance, and American wool has been practically on a free-trade basis. "Our property [that is, the right to levy taxes]," says Judge Lawrence, "has been annihilated." This may be admitted, with rejoicing. But the real property of wool-growers, in the sense of their actual sheep and actual wool, as distinguished from sheep and wool for platform purposes only, has not been touched by the new tariff. One audacious man rose to affirm as much in the convention, and to point out that the price of American wool was actually advancing. Such heresy took away the breath of the "wool kings" for a time, but they soon recovered it sufficiently to vilify the unhappy farmer who ventured to set up as a student of markets, not of maxims. But, though they howled him down, they cannot howl down the market reports. Here is one sent from Chicago, just as the wool-growers' convention was meeting, which speaks of the woollen market as "firm," with holders determined not to "reduce

values," and which lays down the broad proposition that "the great medium grade of wool which is produced in the United States, both staple and clothing, will no doubt hold its own against all foreign wool of the same quality."

---

If the financial condition of the Fall River cotton-mills is contrasted with that of the mills at Oldham in England, it would seem that our manufacturers have little need to fear foreign competition. The capital of the Fall River mills is about $21,000,000, and during the current year they have paid dividends at the rate of about 5 per cent. per annum upon this capital. Probably some have not earned their dividends, but others may have earned more than they have paid. This is not a very satisfactory rate of profit for manufacturing concerns, but it is doing pretty well, considering the hard times. It would be thought doing very well in Oldham. The president of the Manchester Statistical Society shows that 101 cotton-spinning companies in that district have a capital amounting to £7,372,000. During the last six months 65 of these companies have paid no dividends; the other 36 have managed to distribute the meagre sum of £35,667. Returns of profit and loss are made by 93 companies, 41 showing a profit of £52,900, and 52 showing a loss of £344,609, or a net adverse balance for the 101 of £291,709. We should add that the English reports include money borrowed on mortgage in the capital account, so that the share capital is really not very much more than half the amount given above. In fact, the net loss is nearly 10 per cent. of the share capital. It is hardly reasonable to maintain that foreign competitors in this wretched financial condition are likely to be formidable to New England cotton-manufacturers.

---

The annual statistical report of the American Iron and Steel Association for the year 1893 by James M. Swank, is published. We learn from the introductory matter that the association has been compelled, by lack of funds, to discontinue the publication of tariff tracts, but that it left no stone unturned to prevent the passage of the new tariff bill. It records in an historical way the final passage of that bill, but does not say what it thinks of the measure, since it has passed, merely remarking that "now that the worst is known, all employers of labor may well look forward and not backward." Evidently the world is not coming to an end yet. The statistics of iron and steel production for 1893 show a decline of about two million tons of pig, nearly one million tons of Bessemer steel ingots, and about half a million tons of rails as compared with 1892. This slackening of demand was due to the slackening of railway construction and of locomotive and car-building, both of which fell off about one-half. On the other hand, iron-ship building, including vessels for the navy, increased 20 per cent. Our exports of iron and steel in all forms, including locomotives and other machinery, also increased, rising from a little under twenty-eight million in 1892 to a little more than thirty million dollars' worth in 1893. The mining of iron ore fell off 4,700,000 tons. That of coal remained nearly stationary. The statistics of foreign iron and steel show that our production of pig-iron in 1893 exceeded that of Great Britain by nearly 200,000 tons, while in Bessemer steel ingots we exceeded her by 1,700,000 tons.

---

New England papers are calling attention to the great exodus of French-Canadians, who are returning to their old homes in a steady stream, the number who have crossed the border into the province of Quebec since the beginning of summer being estimated at about 40,000. Judging from the way people generally talked about these immigrants when they began coming, we should expect to hear their departure greeted with, "A good riddance to bad rubbish," but there are no signs of satisfaction. The truth seems to be that they have overcome a good deal of the prejudice which formerly existed against them. They have proved an orderly element, and the dangers apprehended from their clannishness and other race faults have proved less than was apprehended.

---

Judging from the experience of Postmaster Dayton, there would be no surer way of hastening the progress of civil-service reform than by shipping the chief spoilsmen to England, with instructions to study the workings of the merit system where it has been in operation for many years. Mr. Dayton is most frank and emphatic in his confessions. To a question by the London correspondent of the New York *Times* whether there is enough difference between English and American practice regarding the civil service in the department to attract his attention, he replied:

> "Yes, my admiring attention. It is hard for an American to realize how completely the notion of partisanship, offensive or defensive, has been eradicated from the civil service here. The postmaster-general is, of course, a politician, who retires with a change of administration. When he is an important public and party man, like Mr. Morley, he has a seat in the cabinet. But think of it! Out of the 125,000 men in the postal service of Great Britain, not to mention 16,000 women, he is positively the only individual whose tenure of place can be affected by any political change."

Mr. Dayton says further that he has devoted some time to investigating this particular question, and that the employees are "perfectly free to hold party views, and I find some of my friends among them belonging to political clubs, equivalent to the Manhattan or Union League at home, but of aggressive partisanship I can't discover a trace. It isn't that they dissemble it; they simply don't feel it—don't know what it is." Evidently this was an unexpected revelation to the postmaster of New York, though the facts are perfectly familiar to every student of governmental methods. It may be hoped that Mr. Dayton will return cured of the absurd idea with which he announced his acceptance of the office, that in filling vacancies he should always give the preference to members of Tammany Hall.

---

The present canvass in Georgia has a bearing upon the discussion of the referendum system. Three amendments to the Constitution are to be passed upon by the voters at the State election on the first Wednesday in October—one changing the time for the meeting of the Legislature from October to July, the second providing for an increase in the number of Supreme Court judges from three to five, and the third granting pensions to ex-Confederate soldiers who are indigent, as well as to those suffering from wounds. So little attention has been paid to any one of these subjects that the Savannah *News* feels moved to say:

> "What about the constitutional amendments that are to be voted upon at the approaching State election? Are any of the candidates discu sing them, and explaining the meaning of them, and what their effect would be if they should be adopted? If not, why not? It is of the utmost importance that the people should vote understandingly upon these amendments."

The *News* proceeds to discuss the questions involved, and points out that the people ought not to be left to vote blindly on the pension amendment particularly, since it may be that its adoption would greatly increase the tax burden—though nobody has yet presented any figures on either side. If it is so hard to get people to take interest in amendments to the Constitution, it is easy to imagine what would happen if a number of proposed laws were submitted to popular vote at every election. Calling the process of submission "the referendum" is not going to make any difference—as it would almost seem that some advocates of the system really suppose.

---

The greatest production of gold in any one year prior to 1893 was that of 1853, when both Australia and California were making their greatest output. But the gold product in 1893, a year of slackened production in most lines, was the greatest ever recorded. Moreover, this high figure—$155,522,000—was the result of a very quick response to an increased de-

mand, for in 1889 the production was but $110,197,000. The recent increase in the gold product of this country is mainly due to the cessation of the artificial stimulus to silver production given by the act of 1890. The Government purchases of silver being stopped, the mining companies found that there was more profit in mining gold, and they have therefore changed their industry. In other countries new mines have been discovered and abandoned ones have been reopened; while in all countries improved processes have been employed, by which refractory ores that were formerly deemed unworkable can be reduced. The quickly exhausted alluvial deposits are no longer the chief source of supply. Powerful machinery, better mining appliances, and new chemical processes are continually cheapening production. There appears to be ample evidence to justify the belief that the production of gold will continue to increase under the influences that have recently stimulated it. With these facts before the public, it may be hoped that those who have been sincerely apprehensive of a "gold famine" will experience some relief of their anxiety. According to the arguments of the bimetallists, this increased production of gold is pregnant with benefit to the "debtor class." If we may speak for the "creditor class," we can say that it contemplates a largely increased supply of gold with equanimity. If this should have the happy result of quieting the agitation for upsetting the present standard of value, it would be a blessing without alloy.

---

The financial difficulties of the Indian Government have occasioned perplexity not only to bimetallists and monometallists, but also to free-traders. When a government finds its revenue less than its expenditure, it seldom accomplishes much in the way of economy, but casts about for new sources of revenue. It is claimed that there can be no increase in the internal taxes of India, and that the deficiency must be met by imposing import duties. But the great manufacturing interests of Manchester have convinced the English Government that it would not be expedient to impose taxes upon the importation of their goods into India. Such a tax, they claim, would operate as a protective duty in favor of the Indian manufacturers of cotton goods. On the other hand, the Indians protest against the imposition of a compensating tax upon domestic manufactures. They use the familiar protectionist arguments in support of their position. A consistent free-trade policy, however, would certainly forbid the imposition of import duties which operate as a bounty to particular individuals, and the Indian Government will be obliged to obtain revenue in some other way than by a protective tariff. In truth, that government is now suffering from its own improvidence. It incurred a very heavy debt by engaging in the "Jingo" policy against Russia, and it is saddled with burdensome guarantees of the bonds of railroads that do not pay expenses. It has guaranteed interest at the average rate of 4¾ per cent. upon the capital of the roads, while according them a share of excess profits, and it has taken upon itself all the loss on exchange in remitting the interest to England. The result is that its guarantee of 4¾ per cent. costs it about 7 per cent. It is probable that the whole fiscal system of the Government would profit by a thorough investigation; but there is little prospect that such a remedy will be adopted.

---

For some years the conservative element among the English trade-unionists has been rapidly losing ground. Not long since this element was in complete control, managing the affairs of the unions with much ability, and applying to Parliament only for such laws as were necessary to relieve them from some rather serious legal disabilities. In fact, the representatives of the unions, when they attended the international congresses upon the Continent, were looked upon as reactionaries of a benighted type, and were in a hopeless minority in all the voting. But the socialists have succeeded in deluding the working people with their ideals, and when the unions meet now they devote their time to devising schemes for carrying on industry by the state. At the session which has just closed in London it was resolved that the state might maintain technical schools, but that no pupils should be admitted except those approved by the trade-unions. Resolutions were also adopted to the effect that promoters of public works should be compelled to provide suitable dwellings for their workmen, and that employers should be punished for importing laborers into a place where, in the opinion of the unions, there is a sufficient supply to meet the needs of the district. On Thursday a proposition to nationalize all mineral lands and royalty rents came up, and, after being amended so as to include "the whole of the means of production, distribution, and exchange," was adopted, "amid a scene of wild enthusiasm," by a vote of 219 to 61.

---

The speech delivered last week by the Emperor William to the nobles of East Prussia has certainly a mediæval ring, but it is both consistent with his known principles and suitable for his audience. It was the speech of a king, ruling by divine right, to nobles resting their title upon practically the same foundation. The nobles can claim for themselves no exclusive privileges without coming back in the last analysis to this principle; and unless they are prepared to surrender their own rank and titles they must defend those of their sovereign. It is too late to replace a monarchy by an aristocracy now; if monarchy goes, democracy comes in in Germany. Hence it is for the interest, and it is in one sense the duty, of the nobility to stand by their king and not attempt to thwart his policy. Instead of yielding to a real diplomatic necessity, and accepting the treaty reducing the duties upon the agricultural products of Russia as an unavoidable concession to circumstances, many of the nobility, especially those whose estates march with the Russian frontier, chose to oppose it, and continued to sulk after it was adopted. This "Agrarian" party was the object of the Emperor's reproaches.

---

The war between China and Japan resembles in some of its strategic aspects that which was fought in the Crimea. China, like Russia, fights at one of its remote extremities, depending chiefly upon its land forces. Japan, like the allies, can reach its adversary only by the use of its naval power. The news from the seat of war is not very trustworthy, but it seems to indicate that the Japanese naval power is superior to that of the Chinese. But, curiously enough, China has an advantage from her backwardness which Japan has lost through her aspiration to the rank of a civilized power. By the Declaration of Paris in 1856, privateering was abolished, and the doctrine that the neutral flag covers the enemy's goods, except those contraband of war, was proclaimed. Of course, this declaration bound only the nations that adopted it. China has not acceded to it, but Japan has. China can therefore issue letters of marque to privateers, and thus destroy the mercantile marine of Japan directly, and she can also capture neutral vessels laden with Japanese goods and condemn such merchandise in a prize court. It is true that Japan is not bound by the Declaration, so far as China is concerned, and may attack her commerce directly; but the flag of a neutral signatory to the Declaration will protect Chinese goods, except contraband of war. Thus an English merchantman is bound to submit to be searched, and if an enemy's goods are found on board, to be captured and taken into port by a Chinese privateer, but is not bound to submit to either at the hands of a Japanese privateer. As the United States have never adopted the Declaration of Paris, their merchant vessels would fare the same no matter into whose hands they fell, so far as this point is concerned. But, owing to the dominance of England in the Oriental trade, the advantage of China over Japan in a war carried on by privateers would be considerable.

### THE MAINE ELECTION.

THE country seems to be pretty full of Democrats of Mr. Cleveland's way of thinking—that the tariff bill was not good enough to be signed and not bad enough to be vetoed. This was evidently the way in which the Democrats of Maine looked at the subject on Monday last. They absented themselves from the polls largely, and some of them, but not very many, voted the Republican ticket. It was not exactly an overturn, since Maine is always a Republican State, but it answers all the purposes of an overturn. It shows that the Democrats have no stomach for the fight this year. The reasons why they have not are not far to seek.

We shall not go back to the silver panic of last year and its disastrous consequences to business. It came at a time when it was easy to persuade those who do not comprehend such matters (and they are the great majority) that it was due to Democratic success in the national election of the previous year, and to the fear of coming tariff changes. This was purely an accident, but there was, of course, no way to avoid it. The tariff must needs be reduced according to the promise of the successful party. Any hesitation to fulfil this promise would have been equivalent to abdication. It was a serious mistake that the work was not begun immediately with the incoming of the new administration. In that case the benefits of tariff reduction, whatever they were to be, would have demonstrated themselves nearly a year before another congressional election. Practically a year passed by, and this was a year of business disaster. Broadly speaking, the time was not lost, since it was filled up by the repeal of the silver bill, a more important step than any tariff bill whatsoever, but not a step to have an immediate political effect. All that could be hoped from it was a gradual mend, a slow recovery from the panic of the previous year.

When the real work of tariff reform was taken up, there was universal eagerness for speedy completion of it The bill was pushed in the House as rapidly perhaps as such bills ever move. When it reached the Senate, it met an obstruction that had not been anticipated, and when this obstruction came to be examined, it was found that the most conspicuous and odious monopoly in the whole country had intrenched itself in that body and had constructed barriers to prevent any tariff bill from passing which did not contain provisions to give it the same power to tax the people that the McKinley tariff had given, though in a different form. Of course this could be done only by having a certain number of Democratic votes—say four or five. The Republicans *en masse* would vote against any bill the Democrats might pass. It was their business to do so. Forty-three votes were needed to pass a bill. There were a few votes on the dividing line between Democracy and Populism which could not be counted upon with certainty. The situation was such that a small group of speculators, if there were any such in the body belonging to the Democratic party, could block all movement and prevent the passage of any bill. It happened that there were three or four men answering this description. One of them was detected in a sugar speculation. The others were believed to be no whit better, although they have not been found out. It was an ominous circumstance, also, that the particular clause of the bill which caused all the trouble and all the scandal was drawn by the secretary of the treasury, and that all his influence, so far as he used any, was employed for its retention.

The result was delay and exasperation on the part of the business community, disgust immeasurable on the part of decent people, and finally a surrender to the Sugar Trust. It was an unavoidable surrender. It involved no disgrace upon those who passed under the yoke. Like the Roman legions, they had done all that they could. Nevertheless the party had to take the consequences. It is this conjunction of circumstances that has taken the heart out of the Democratic party for the time being. It is not a bad thing that it is so. Another reform besides reform of the tariff must be undertaken if the Democrats are to recover their lost ground. The party must purge itself of its Sugar Trust element with all possible speed. It does not follow from the Maine election that we are going back to the McKinley tariff or anything resembling that. The Republicans are not likely to forget the lessons they learned in 1890 and 1892. If they get into power again, they will find plenty of reasons to give the tariff fanatics the cold shoulder.

### THE DEBS CASE.

THE trial of the charges of contempt of court against Debs and others, which is now proceeding at Chicago, will bring up some very important questions for adjudication. These questions are, of course, of primary interest to the legal profession, but an examination of what is really involved in the case will satisfy every intelligent citizen who cares for the sound and healthy development of his country's institutions that the legal questions are relatively insignificant. The issue really lies, as the lawyers say, in a nutshell, and it can be stated so simply that every one can grasp it. It is briefly the determination of the question whether courts shall assume the function of inflicting summary punishment without jury trial for acts punishable by ordinary criminal proceeding.

There is no doubt of the power of a court to punish summarily those who disobey its orders. It has been deemed impossible for courts to maintain a necessary respect for their processes without this power. That it may be effectively exercised, the judge before whom the contempt is committed is allowed to inflict punishment according to his discretion, and without stay or appeal. The person charged with contempt has a right to be heard, but he must appear in person and cannot demand a jury or insist upon the aid of counsel. This power probably originated in the necessity for preserving order in the court-room, and, since attorneys are looked upon as officers of the court, it is natural and proper that they at least should be subject to strict discipline. Yet it is evident that the remedy is of a nature contrary to the free spirit of English jurisprudence. It is arbitrary and despotic. However, as English judges have generally been animated with the spirit of liberty, they have rarely abused this power. It has been enough that it existed to accomplish the purpose of its existence. To the honor of the courts, they have very cautiously extended the use of the remedy by injunction as applied to acts committed outside of court. The rule that equitable remedies will not be granted so long as a remedy at law exists, is still an established rule; but it cannot long be maintained if such injunctions are to be granted as those recently issued from the United States courts.

We cannot, within our space, trace the steps by which the scope of injunctions has been recently extended. A writer in the Albany *Law Journal* of September 1 has pointed out these steps, and ultimately the whole matter will doubtless be reviewed by the United States Supreme Court. Suffice it to say that an "omnibus bill" was filed last July at Chicago to prevent interference with twenty-three great systems of railway, and an injunction was issued not only against a number of persons named, but also against the members of the American Railway Union to the number of thousands, and "all other persons whomsoever." No satisfactory precedent exists for injunctions of such wide scope as this. If we may trust a newspaper report of Judge Woods's language, he took the ground that his injunction was not necessary to prevent interference with the mails, that being a crime for which arrest and indictment was provided. It was more necessary to make the order to prevent interference with interstate commerce; but the true reason, and the only one "for issuing an order at all, was that it was a means of meeting the present emergency, for the process of arrest and indictment was slow."

Whether Judge Woods used these words or not, they describe the situa-

tion correctly. There was an adequate remedy at law, and if it was slow it was the fault of the officers of the law. But it was not slow when the highest magistrate in the land swept aside the incompetent and traitorous gang of local bailiffs, and put an end to rioting with even less than a "whiff of grape-shot" by the prompt discharge of his constitutional duty. The remedy at law, for such it may properly be called (the troops of the United States being really peace officers), was quick and it was adequate. It may be doubted whether the injunctions were not wholly superfluous.

But granting that, it may be said, were they not at least harmless? We apprehend not. Our readers do not require to be told that we regarded the aims of the strikers at Chicago as hopeless and their methods as wicked and criminal. We do not forget, however, that these men are our fellow-citizens, or impute to them as a body any exceptional depravity. It is in the highest degree important that the very poorest member of the community should possess unshaken confidence in the integrity of our judges and the impartiality of the administration of justice. We fear that many of the common people, especially in the Western States, entertain the belief that the courts have allied themselves with the great corporate interests of the country, and it is eminently desirable that this belief should have no sound basis. It is the duty of the courts to defend rights of property, and upon this account they incur a certain degree of unpopularity with those who have few such rights to defend. But every effort should be made to escape this odium by exhibiting the strictest impartiality, and there is reason for contending that this caution has been disregarded in the recent injunctions. Upon their face they indicate the purpose of causing the arrest and punishment of citizens, without trial by jury, for offences for which criminal jurisprudence provides that right. If there is no other way of repressing crime except by treating it as contempt of court, our jurisprudence must be reconstituted upon models that have more likeness to those which prevail under despotic governments.

## *MORE POLICE CORRUPTION.*

Mr. Goff made it very plain at the first session of the resumed Senate inquiry that he had by no means exhausted the field of police incompetence and depravity. Indeed, the depths which he sounded on Monday were a little lower than any that he had touched heretofore. He began with that branch of the service which Superintendent Byrnes singled out in his recent letter to the Police Board as the one especially entitled to commendation, the Detective Bureau. Mr. Byrnes said of this bureau that since its reorganization in 1880 it has "reached such a high standard of efficiency and discipline as has not been equalled by any other detective bureau in the world." Yet Mr. Goff shows by the mouth of one of the chief officials of that bureau that he is either totally ignorant of the law governing his conduct in a most important branch of his duty, or wilfully guilty of systematic violation of the law.

The way in which Mr. Goff brought out this fact was a striking illustration of his skill in such matters. He showed that it is customary for the Police Department to send out postal-cards to pawnbrokers describing stolen property, and pledging on behalf of the owners of such property payment of the money which may have been advanced on it to the thieves who have brought it to the pawn-shops; that detectives habitually advise persons whose property has been stolen to pay the money which has been advanced on it, and that detectives not infrequently receive a share of the money thus paid over. Sergeant Hanley, who admits these things, and admits also that in one case he received $17 for his services, confesses that he had often heard judges in the Court of General Sessions declare that stolen property belongs to the owner and may be recovered wherever found, but denies that he knows that a detective has the right to go into any pawnshop in the city, seize stolen property which is identified by the owner, and pass it over to the latter without charge. This is an extraordinary state of mind for an official of the best detective bureau in the world to manifest. The picture which he presents of the method pursued by that bureau makes it an ally with the thieves and pawnbrokers against the citizen whose property has been stolen. There is no other interpretation to be put upon Sergeant Hanley's testimony.

After Sergeant Hanley came another witness whose testimony was scarcely less startling, though it was not in a new field. Another green-goods operator was produced who supplemented the testimony of the witness Appo, given several weeks ago, in regard to the payments made to the police for the protection of the operators of this swindle. Applegate, the latest witness, gave a very straightforward and circumstantial account of the way the green-goods business had been carried on in two police precincts presided over by Capt. Meakim, saying that when the captain was transferred from a down-town precinct to one in Harlem, the business was transferred with him, and was carried on without molestation in both localities because of the payment of $50 a month to the captain. He sustained his testimony with much circumstantial evidence, and Mr. Goff sustained it with some printed circulars, and used these with much dramatic effect to convict the printer of them of perjury when he was put upon the stand. Incidentally, evidence was adduced to show that the chief green-goods operator, McNally, was on very friendly terms with Sergeant Hanley of the Detective Bureau.

Taken altogether, Monday's evidence is of the first importance, perhaps of greater importance than any that has preceded it. It shows that there is no branch of the police service that is not thoroughly rotten, and strengthens the already strong conviction that there is no radical remedy for that service save its complete abolition and reconstruction on new lines. Mayor Gilroy's complacent observations, which he put forth with such impudent assurance on the following morning, were not well timed. He should have waited till he had read Mr. Goff's new testimony before he took the position that, in removing certain police captains after Mr. Goff had proved their guilt, the police commissioners have vindicated themselves and exonerated Tammany Hall. Now he will see that the police commissioners have still further work to do before the vindication will be complete, and that by the time they shall have succeeded in getting all the corrupt men out of the Police Department, there will be a very small force of officials left therein.

It is within the bounds of probability also that the police commissioners themselves may be on trial before the inquiry is ended, if it can be maintained by anybody that they have not been on trial since the beginning of the inquiry. Whose system is it that is found to be so saturated with corruption? Who has been administering the affairs of the Police Department for the past quarter of a century? Tammany men, either avowed or disguised. Nearly all of them have been appointed by Tammany mayors. All this corruption has been in existence under their noses in their own department, and they never suspected it until Mr. Goff showed it to them. What a charming lot of innocents they have been! And what a charming innocent the mayor is when he comes before the public and points with pride to their virtue, Tammany's virtue, in getting rid of the blackmailers, after they have been exposed! "We never allow thieves and blackmailers to stay in office after they have been shown up!" This is the Tammany platform upon which the Tammany mayor proposes to go before the people in the coming election.

## *HELMHOLTZ.*

Dr. Hermann Helmholtz, as his contemporaries have called him, the acknowledged

and worshipped head of the scientific guild, is gone. He was born on August 31, 1821, at Potsdam, where his father was professor of the gymnasium. His mother's maiden name was Caroline Penn; she came of a branch of that family settled in Germany since the religious troubles in England. From childhood Hermann had a passion for science; but the nineteenth century came near missing this great light, for the circumstances of the family were such that no road to science was open to him except that of studying medicine in the Military Institute of Berlin He took his degree of M.D. in 1842, and his inaugural dissertation, the only Latin publication of his life, related to the nervous systems of invertebrate animals. He was at once attached to the service of charity, and began without delay to study putrefaction, upon which in 1843 he published a memoir maintaining its purely chemical nature—an opinion subsequently surrendered. He soon returned to Potsdam a surgeon in the army. In 1845 he was employed with good reason to write articles on animal heat in a medical encyclopædia of high character, and in the yearly report upon the progress of physics. The same year he printed an original investigation of the waste of substance of a muscle in action.

After that, for about two years, he produced nothing. It was one of those periods of seeming idleness to which the most productive geniuses are subject, and which afford mediocrity matter for carping. Other young scientists filled the journals of 1846 with the records of their industry, but not one syllable came from Helmholtz. He was not heard from until 1847, and not till July 23, when he read a paper before the Physical Society of Berlin. This paper was entitled "The Conservation of Force." In the judgment of many of those who have examined the matter, it was the epoch-making work from which alone the greatest scientific discovery that man has ever made must date. Certainly it was the argument which produced the intense conviction with which the world has held that doctrine ever since. It is fair to say that other excellent critics, and Helmholtz himself among them, award the merit of the first enunciation of the great law to Robert Mayer, who, in 1842, had published a paper which attracted no attention whatever, and of which Helmholtz in 1847 was as little aware as the rest of the world. But, in any case, there is no doubt that Helmholtz was the first to conceive the proposition from the point of view which made it so attractive to all accurate thinkers and so wonderfully fecund in new truth.

According to his statement, nothing exists in the outer world but matter. Matter *in itself* (*an sich*) is capable of no alteration but motion in space, and these motions are modified only by fixed attractions and repulsions, and this is true everywhere, even in the actions of animals and men. It was an amazingly bold assertion, utterly opposed to almost every kind of philosophy, certainly to Kantian and all post Kantian idealism, as well as to the nominalistic idealism of the English school, which such writers as Ernst Mach have taken up. But the implicit faith with which it has been received is a singular psychological phenomenon, for the theory that all human actions are subjected to a law having no teleological character, when we know (or seem to know) that our actions are adjusted to purposes, has obvious difficulties; and the experimental evidence of the correctness of the law as applied to animal physiology is very slender. Indeed, some of the most careful researches (as those of Fick and Wislicenus) have led to results directly opposed to it. Yet the physiologists, one and all—the judicious Michael Foster, for example—simply treat those results as absurd. In this aspect Helmholtz's great doctrine appears as the pet *petitio principii* of our time. Its truth was unquestionable, in the only sense in which anything based on induction can rationally be admitted as true, namely, its *close approximation* to exactitude. Nobody can deny that it is at once the crown and the key of physical science. In that memoir, by the way, Helmholtz first displayed his facility in applying the calculus to unaccustomed problems—a facility very surprising in a man of twenty-six whose studies had been supposed to lie in the direction of anatomy and physiology. Surely, in the company at that memorable meeting of the Physical Society there must have been some who were able to discern that they were in the presence of one of the most stupendous intellects that the human race had yet produced.

Of course, a reward was due from organized humanity to the man who had thus lifted man's mind to a higher vantage ground. And this reward came, for the next year he was created no less than assistant in the Anatomical Museum of Berlin. He now began to occupy himself with the physiology of hearing. In 1849 he was appointed supplementary (or extraordinary) professor of physiology in the University of Königsberg (without salary), and in 1850, on July 19, he communicated to the Physical Society of Berlin an elaborate memoir breaking ground in the interesting field of the measurement of the duration of nerve-actions. In 1851 he invented the ophthalmoscope, for which many and many a human being has owed him his eyesight. This year he began an original study of electrodynamics. In 1852 he was promoted to a regular chair in the university. His discourse upon his installation dealt with peripheral sensations in general, especially those of sight and hearing. It was a comparison of the relation existing between the vibrations that excite a given sense, and those existing between the sensations themselves. We remark that while the memoir on the Conservation of Force fairly bristled with repetitions of the philosophical phrase *an sich*, "in itself," it is in this discourse carefully avoided. It would seem that something must have happened in the interval which made Helmholtz dread "*an sich*" as a burnt child does fire. In this paper, such ingenuity is used to avoid it that but once does it slip in, and then in a negative phrase. But since the idea was there, we cannot praise Helmholtz for not giving it its proper dress.

In giving the substance of his lecture, we need not imitate his circumlocutions to avoid this natural phrase. His point was this: vibration-systems essentially different give rise to precisely the same color-sensations. There are three fundamental color-sensations, which, being mingled in different amounts, give rise to all others; but there is nothing corresponding to this tri-dimensionality in the vibrations themselves. On the contrary, the sensations of a color-blind person for whom one of the three fundamental sensations is non-existent, much better correspond with the facts in themselves. Sounds, on the whole, correspond more accurately to the vibrations. But, to the ear, the difference between one rate of vibration and another is hardly perceptible until two different sounds are compared. If a melody is transposed to another key, the effect is nearly the same; but a painter who should transpose red to yellow, yellow to green, green to blue, and blue to violet, would make a nightmare of his painting. These are certainly striking facts; but still more interesting is it to note what lesson it was that this typical nineteenth-century understanding drew from them. Other minds as clear as his might have read here the incommensurability between mind and matter, and have found a refutation of materialism in the circumstance that mind here acts as matter could not do. But the conclusion of Helmholtz is that the sense-qualities distinguish the things in themselves about as well and about as arbitrarily as the names Henry, Charles, and John parcel out human kind.

Besides this "Habilitationsvortrag," a "Habilitationsschrift" was expected from the new professor, and this last set forth his theory of the mixture of colors. It was, at bottom, the doctrine of Dr. Thomas Young; and only the careful comparison with observation, and the application of it to explain effects of mixing pigments and the like, were new. In 1854 he attended the meeting of the British Association at Hull, and there read a fuller account of his theory of colors, which no doubt induced Maxwell to take up this study, who soon made it even more lucid and beautiful than Helmholtz had done. In 1855 he became professor of physiology at Bonn. In 1856 he began the publication of his great treatise on physiological optics, which was not completed till ten years later. On May 22 of the same year, he announced to the Berlin Academy his discovery of combinational tones, which are musical sounds resulting from the interferences of the vibrations making two other sounds.

In 1858 he became professor in Heidelberg, at that time the ultimate goal of a German professor's ambition; and in the same year he astonished the mathematical world by his great memoir on eddies, or vortices, a matter of fundamental importance in hydrodynamics. It was a very great and fruitful idea which he there advanced, and which he wonderfully developed. Much has already come from it, but its full harvest yet remains to be gathered in. No mathematician will dispute that this was a work only second in importance to the cataclysmic essay on the Conservation of Force. During the next two years Helmholtz's acoustical researches were very prolific, and at the same time he published remarkable papers upon color-blindness and upon the contrasts of colors. In 1860, on April 12, he read to the Vienna Academy a paper giving measurements by his pupil, Von Pietrowski, of the viscosity of fluids, with a mathematical discussion by himself. Although the subject was not quite new, Stokes's masterly work dating from 1851, still Maxwell's researches were not yet begun, and this memoir constituted another important contribution to hydrodynamics and to the general conception of matter. Helmholtz himself very soon began to apply these ideas in acoustics.

We next find him engaged upon the difficult problem of the horopter and the motions of the eye. One of the next subjects to engage his attention was the musical note which is emitted from a strongly contracted muscle. In 1862 appeared his great work on Sensations of Sound and the theory of music, and with it the main work of his life was accomplished. Since that time he has indeed produced enough to make another man famous; it is little only in comparison with his earlier achievements. He has written, for example, papers upon the facts underlying geometry which were sub-

stantially anticipated by Riemann's great work, with which Helmholtz would seem not to have been acquainted. To produce independently that which was the proudest laurel of one of the most original mathematicians of the ages was a great feat, but it was needless. There were also a series of memoirs in which Helmholtz discusses all the principal systems of formulæ which have been proposed by different physicists as laws of electrodynamics. He gave the first mathematical explanation of the formation of ordinary waves upon water —an explanation which not only enables us to see why certain forms of waves which might exist are not produced in nature, but also throws much light on other subjects. In 1871, he was appointed professor of physics, no longer of physiology, in the University of Berlin. Twenty years later he was made president and director of the Physikalisch-Technische Reichsanstalt, a foundation under the control of the Imperial Department of the Interior, for the experimental furthering of exact natural inquiry and the technics of precision.

Not the slightest allusion to any moral or religious problem ever dropped from the pen of Helmholtz. Though no reference to Hegel or Hegelianism appears in his pages, he more than any other namable person caused the downfall of that kind of speculation in Germany, and brought in the present admiration for the English style of philosophizing which his own so much resembled. The temper of the man was admirable. He never indulged in one of those reclamations of priority into which scientific vanity is sure to be betrayed, but several times published notes to show that his own results were not so new as he and the scientific world had believed them to be. He did much to bring into notice the works of other physicists, among them the Americans Rowland and Rood (his visit last year to this country is freshly remembered). He found himself several times engaged in controversies with redoubtable antagonists, Clausius, Bertrand, perhaps we may so reckon Land. In every case he so conducted himself as to bespeak an imperious desire to find out the truth and to publish it; and every approach to personality was avoided or flung away from him as a pestilential infection. The world owes much to the intellectual clearness and integrity of Hermann Helmholtz, M.D.

## VOX POPULI IN SWITZERLAND.

BERN, July, 1894.

To outward appearance, Switzerland is an atoll in the surging ocean of European politics. Here the increasing strain which has come upon the representative institutions of other countries is hardly felt. Here the Legislature is free from party organization, the business of the country is well and promptly done, the people are content with their representatives. Here, also, we are paradoxically assured, such statutes as do not commend themselves to the popular will may be revised by the Referendum; and reforms ignored by the Federal Assembly may be framed and enacted through the Initiative. These two ingenious applications of pure democracy to large communities are urged upon Americans because so successful in Switzerland. There has long lain in my mind a suspicion of a device which assumes to relieve men from the results of their failure to choose representatives who really represent them; and this incredulity has not been removed by staying in Switzerland and looking into the practical working of the much-lauded system. Fortunately there is a body of material on the subject: besides the messages sent in by the Executive Council after each popular vote, there is an official report of 1892 summarizing the statistics since 1848; and I am much indebted to several Swiss statesmen and publicists for frank and suggestive discussion.

No criticism of the referendum can be worth while which does not take account of the difference of political conditions in the United States and in Switzerland. In size, population, and wealth the latter country is very like an American State, say Massachusetts; the six hundred and eighty thousand voters are distributed in a compact land, with excellent election machinery. The cantons, unlike the commonwealths in America, are steadily losing ground to the federal Government, and the Swiss Senate, the Council of States, has less power and prestige than the elective National Council. The legislative practice of the two countries is also different: few bills are presented to the federal Assembly, and very few are enacted, so that in 1891 but fourteen general laws were put upon the statute-book. The Executive Council, though without a veto, has an important part in legislation: it legislates for itself in many matters of detail; and on larger affairs prepares and submits bills which the Assembly frequently enacts without change. This preparation of legislative material by the executive is a tradition in the cantons as well as in the Swiss union. The Diet took this function on itself under the old Confederation, and, indeed, the word "referendum" was originally applied to the process of referring measures back from the Diet to the cantons; it was too often a political "how-not-to-do-it." The present referendum is, therefore, practically a check both on the Executive and the Legislature, and can easily be invoked on a considerable proportion of all general statutes. To apply it to acts which have already run the gauntlet of an executive veto, and have found a place in the obese statute-book of an American commonwealth, is a different matter. Nor is it so easy in Switzerland to crystallize the opinion of the Assembly into concrete measures, since the lively sectional and religious rivalries of the country are not expressed in well-organized parties. Conventions and caucuses with us take the place which the initiative is meant to fill in Switzerland. So different are all the conditions in the two countries that the success of the referendum in the one does not at all imply that it would work well in the other; while if the referendum has disappointed its friends in Switzerland, where it harmonizes with other institutions, it is not likely to succeed in the United States. And whatever might be done in the States, a national referendum would nullify the Senate, and hence be a complete change in the American system of government and probably a national misfortune.

A judgment of the referendum must be based on the working of the electoral machinery, on the interest shown by the voters, and on the popular discrimination between good and bad measures. The process of invoking and voting on a referendum is simple and easily worked, if not used too often. Although the Assembly has, in urgent cases, the constitutional right to set a resolution in force at once, it always allows from three to eight months' delay so as to permit the opponents of a measure to lodge their protests against it. Voluntary committees take charge of the movement, and, if a law is unpopular, little difficulty is found in getting together the necessary thirty thousand or fifty thousand signatures. Only thrice has the effort failed when made. When, as in 1882, the signatures run up to 180,000, the labor is severe, for every signature is examined by the national executive to see whether it is attested as the sign manual of a voter; sometimes, in an interested canton, as many as 70 per cent. of the voters have signed the demand. The system undoubtedly leads to public discussion: newspapers criticise; addresses and counter addresses are issued; cantonal councils publicly advise voters; and of late the federal Assembly sends out manifestoes against pending initiatives. The federal Executive Council distributes to the cantons enough copies of the proposed measure, so that one may be given to each voter. The count of the votes is made by the Executive Council as a returning-board. Inasmuch as the Swiss are unfamiliar with election frauds, and there has been but one very close vote in the national referenda, the count is not difficult, but there are always irregularities, especially where more than one question is presented to the voters at the same time.

What is the effect of the popular votes, thus carried out? The following table, based on official documents, shows the results for the twenty years, 1875–1894:

| | Passed. | Rejected. | Total. |
|---|---|---|---|
| (*a.*) Constitutional amendments proposed by the Assembly (referendum obligatory) | 1 | 6 | 7 |
| (*b.*) Constitutional amendments proposed by popular initiative (50,000 signatures) | 2 | 1 | *4 |
| (*c.*) Laws passed by the Assembly (referendum demanded by 30,000). | 14 | 6 | 20 |
| | 17 | 13 | 31 |

* One measure still pending.

Making allowances for cases where more than one question has been submitted at the same time, there have been twenty-four popular votes in twenty years. In addition, most of the cantons have their own local referenda; in Zurich, for example, in these twenty years, more than one hundred other questions have been placed before the sovereign people. These numbers are large in themselves, but surprising in proportion to the total legislation. Out of 158 general acts passed by the federal Assembly from 1874 to 1892, 27 were subjected to the referendum; that is, about one-sixth are reviewed and about one-tenth are reversed. Constitutional amendments usually get through sooner or later, but more than two-thirds of the statutes attacked are annulled. To apply the system on such a scale in any State of our Union is plainly impossible; thirty-nine-fortieths of the statute-book must still rest, as now, on the character of the legislators.

Nevertheless it may be worth while to excise the other fortieth, if experience shows that the people are more interested and wiser than their representatives, when a question is put plainly and simply before them. I must own to disappointment over the use made by the Swiss of their envied opportunity. On the twenty referenda between 1879 and 1891 the average vote in proportion to the voters was but 58.5 per cent.; in only one case did it reach 67 per cent.; and in one case—the patent law of 1887—it fell to about 40 per cent. in the Confederation, and to 9 per cent. in

Canton Schwyz. On the serious and dangerous question of recognizing the right to employment, this present year, only about 56 per cent. participated. In Zurich there is a compulsory voting law, of which the curious result is that on both national and cantonal referenda many thousands of blank ballots are cast. The result of the small vote is that laws, duly considered by the national legislature and passed by considerable majorities, are often reversed by a minority of the voters. The most probable reason for this apathy is that there are too many elections—in some cantons as many as fifteen a year. Whatever the cause, Swiss voters are less interested in referenda than Swiss legislators in framing bills.

Of the comparative wisdom of the representatives and their constituents it is difficult for a stranger to judge. The general tendency of the referendum is to rebuke the Assembly; more than half the questions submitted are lost on popular vote, and more than half of all the ballots cast have been adverse. Certain cantons, notably Uri and Appenzell (Inner Rhode), are almost always against the proposition, without much reference to its purport. The records of the Assembly rarely show test votes on any question, but there is a remarkable divergence between the temper or judgment of that body and of the people. The constitutional amendment of 1893 on the slaughtering of animals commanded less than a third of the members of either house, but was carried on popular vote by about three to two. The amendment of 1894 on the practice of professions had every vote in its favor in the Council of States, but was lost in referendum. An eminent publicist, member of the Assembly and an upholder of the referendum, explains this divergence by the public spirit of the members, who vote according to their convictions and not in subservience to their constituents. If this be true, it is an indictment of the system; if the people are wiser than their representatives on questions of legislation, the latter ought to bend beforehand, without waiting for the pressure of the referendum. So far as I can judge, public opinion on such matters is so uncertain that the members cannot understand or predict it.

On the recent proposition to assert the right of every Swiss to employment, only 2 members out of 110 voted for it; but out of doors it received 75,000 votes against 308,000. Certainly the referendum is especially fatal on complicated questions of commerce and finance, the least suited to such a system. It was only on the third attempt that a bank-note system could be arranged. Another interesting example is the bill for the purchase of the Swiss Central Railroad. The Executive Council in May, 1890, desired to negotiate on the subject, and the Assembly passed a resolution granting the necessary authority. No referendum was laid against the resolution, and the Council, believing that the principle was accepted, in March, 1891 made a provisional contract for the purchase. The law ratifying this contract was duly passed, but 92,000 signatures were lodged against it, and it was defeated by a majority of 140,000. This might be accepted as a popular judgment against State railways; but, in fact, it seems to be only a protest against the terms of the contract, and it is expected that the work will soon be all done over again. In the cantons it is even worse: I am informed that in some of them new money bills are almost invariably rejected on referendum, and humiliating devices have to be used in order to get the funds necessary for the support of the Government. Most impartial observers who examine the list of bills lost in the national referendum will be inclined to think the judgment of the Assembly better and more consistent than that of the people.

To the Anglo Saxon mind, accustomed to distinguish between laws of detail and fundamental laws, which are independent of temporary waves of public feeling, the referendum seems confusing. Is it necessary to set in motion all the machinery of a popular election to settle such questions as sometimes come before the Swiss people? In 1884, when General Frey, now President of the Confederation, was minister in Washington, the Executive Council asked that his allowance be raised from fifty thousand francs to sixty thousand francs a year. The Assembly, though not at that time given to prodigality, adopted the necessary vote, in the form submitted by the Executive Council. Ninety-three thousand protests were lodged, and the act was reversed in referendum by 40,000 majority. Even admitting the superiority of the judgment of the people over that of the minister, the Executive Council, and the Assembly, it does not seem worth while to spend so much public energy on a matter of so little moment. The initiative deals less with small questions, but it acts as a standing constitutional convention to frame amendments. Thus in 1893 a clause possibly directed against cruelty to animals, and certainly intended to annoy the Jews, was by the participation of less than half the voters solemnly added to the constitution. In the United States we have already the good effects of the referendum so far as it deals with changes of the constitutions, the permanent and superior part of our law; perhaps that is as far as it really aids the people to express their will in consistent legislation.

In the last two years three amendments have been introduced by initiative which show that the referendum may become a powerful socialistic weapon. The slaughtering amendment was in effect directed against a class, and was successful; the amendment assuring employment was in the interest of a class, and was lost; the pending amendment for a distribution of money to the cantons is directed by poor cantons against rich ones. Against all these propositions the Assembly has set itself steadfastly. "I am a friend of the referendum," says an eminent member of the Executive Council, "but I do not like the initiative." The experience of Switzerland seems to show four things: that the Swiss voters are not deeply interested in the referendum; that the referendum is as likely to kill good as bad measures; that the initiative is more likely to suggest bad measures than good; that the referendum leads straight to the initiative. The referendum in the United States would therefore probably be an attempt to govern great communities by permanent town meeting.

ALBERT BUSHNELL HART.

## THE SEINE, THE MEUSE, AND THE MOSELLE.—II.

BERNCASTEL-AM-MOSEL, August 14, 1894.

THE upper Meuse, above its passage through the Ardennes to Commercy near its head, is, unlike the Moselle, an enfeebled river. Its valley exhibits meandering curves almost as strong as those of the Seine and the Moselle, but the river fails to fit the curves of the valley. It twists and turns on its flood-plain, now touching one part, now another part of its valley sides, but not succeeding at all in boldly swinging around the valley curves. About Commercy, it may almost be said to wriggle across its flood-plain, so distinctly is its minutely tortuous course out of accord with the sweeping curves of its valley. Clearly, when the valley was formed, the river that cut it had a larger volume than the present Meuse; for while small rivers may truly enough make wide valleys if time is allowed them, they can never in a short or long time cut valleys with systematic curves of large pattern such as are appropriate to large rivers. Moreover, the dwindling volume of the Meuse is shown about Commercy and further down stream by the manner in which the flood-plain appears to overlap the lower slope of the valley sides, just as if the valley were slowly filling up with the silt that the river cannot carry away. When the national road shortens its distance by climbing over the shoulders of the spurs around which the valley winds, you may see the rich green of the level river plain broadly stretching from slope to slope; the tortuous little Meuse winding its crooked way across the fields; the abundant herds of cattle on the rich pastures; the canal and the railway running in long tangents between occasional curves near one side of the plain or the other; the villages on the valley slopes just above the wet meadows. Descending to cross the plain, its margin seems to be laid upon the valley slopes, which have every appearance of descending to greater depths than are now visible; the little Meuse has only a shallow channel, and makes no sign of entrenching its course in the plain; a very moderate flood would overflow the meadows. Here, then, is a river that is filling its valley, not deepening it; aggrading its valley, not degrading it; and nothing can be more characteristic of an enfeebled river than such behavior. A large river may cut down its valley to a very gentle grade. A smaller river needs a steeper grade on its way to the sea. If the grade is too faint for its needs, it will lay down some of its burden and build up a grade to suit itself, and thus a rising and steepening flood-plain will be formed along and across its valley floor. The feeble Meuse about Commercy and Sedan has every appearance of behaving in this way; its contrast with the robust Seine and the vigorous Moselle is complete. The middle river has in some way been weakened, while its neighbors on either side have been invigorated.

Climatic change cannot be appealed to in explanation of the lessened volume of the Meuse; for in that case its neighbors should have dwindled also. A clue to the puzzle on the side of the Moselle was given as long ago as 1829, when a French geologist, Boblaye, noted that pebbles like those now carried by the Moselle, and derived from the Vosges Mountains, were to be found in the valley of the Meuse below Commercy, or more accurately below Pagny-sur-Meuse, a village a few miles above Commercy. Other writers have since studied these pebbles, and it is now well understood that the Moselle above Toul once ran into the Meuse. On the side of the Seine I have not yet had opportunity of search in scientific literature to learn whether the rearrangements there have hitherto been described; but study on the French maps at home had convinced me that the Aire, now belonging to the Seine system, once belonged to the Meuse, and a sight of it on the ground strongly confirmed my belief. In a few years we may hope to see the whole question fully treated in a volume on the Rivers of France now in preparation by Col. de la Noë of the

geographical service of the French army, and M. Emm. de Margerie, the most active and successful students of physical geography in Paris. It was through the kindness of these gentlemen that I saw while in Paris a copy of the exquisite model of the upper Moselle, constructed under the direction of the Army Engineers, a partial duplicate of which was at the Chicago exhibition last year—now, I am glad to say, remaining with us as a gift to the geographical laboratory at Harvard—and it was at their suggestion that the upper Meuse was included in my summer's excursion.

What interests me particularly in the loss of the side branches of the Meuse is the geographical evidence of the fact. It is not necessary to appeal to pebbles from the Vosges, although, of course, they are competent witnesses. The forms of the valleys at the points of change are self-declaratory, and deserve to be minutely studied as types of the geographical features characterizing rearranged drainage. Not only is each case distinct in itself, but the essential features of rearrangement are identical in the two cases, and thus one confirms the other. In order to state them briefly, let us agree to call the Meurthe-Moselle the main stream of the eastern system; this corresponds with the Aisne-Oise-Seine of the western system. The Moselle above Toul was once an important branch of the Meuse; this may be called the Moselle-Pagny, after the name of the village now standing at the former junction of the Moselle and the Meuse. The Aire above Grandpré was another important branch of the Meuse, entering it just below Sedan by a valley now followed by the Bar; its former course may, therefore, be called the Aire-Bar. Now, in both cases, the change from the former to the present courses was effected by the headward growth of branches of the Muerthe-Moselle or of the Aisne-Oise-Seine; these branches growing so far as to tap the former affluents of the Meuse, and, by offering them outlets at a lower level, tempt them to desert the Meuse and go to the sea by their present courses. The tapping branch of the Meurthe-Moselle grew southward from the village of Pompey (the present junction of the Meurthe and the Moselle) as far as Toul, and there diverted the Moselle-Pagny; consequently there remains from Toul to Pagny-sur-Meuse the abandoned meandering valley of a considerable river, now occupied by a very small stream, fed from the enclosing hills. The tapping branch of the Aisne-Oise-Seine grew eastward at Grandpré (near the present junction of the Aisne and the Aire) as far as the village of St. Juvin, and there diverted the Aire-Bar; consequently there remains from St. Juvin to Sedan again the abandoned meandering valley of a considerable river, now occupied by a very small stream, the Bar, fed from the enclosing hills. Many other minute features might be mentioned, every one of which occurs in both of these examples, and every one of which fits perfectly into the ideal scheme of river adjustments.

Although the features are small, they are extremely significant. They are to physical geography what minute anatomy is to biology, neglected heretofore, but essential now in the modern developments of science. Their comprehension adds wonderfully to the enjoyment of the landscape, not only by explaining it, but by bringing distinctly into notice a variety of minor forms that might otherwise easily escape the eye. Moreover, the changes that these little features indicate are not only of local interest, close about the place of their occurrence; they are intimately associated with the behavior of the diminished Meuse and the invigorated Seine and Moselle, hundreds of miles away. The abandoned meandering valleys, formerly occupied by the Moselle Pagny and the Aire-Bar, now afford passage to important canals on easy grades, thus connecting the facts of river history with the opportunities of human development. The former beds of the diverted rivers supply gravel for the roads of their district, and thus associate the smaller facts of to-day with greater facts of prehistoric times. The flood-plained valley of the upper Meuse is a great pasture-farm.

I look to see these old abandoned valleys and others herein named minutely studied and illustrated, and serving as the subjects for theses based on local investigation by the young geographers of the coming century. We have had enough of learning how many branches a river has; it is time to learn why one river has more than another; why the upper Meuse runs with hardly more than a branchless stem between the broad-spread branches of the Moselle and the Seine. This is a little contribution to that history. W. M. D.

# Correspondence.

## THE FENTON CASE.

To the Editor of The Nation:

Sir: I missed your number of August 23, containing "Fair Play's" letter about the Fenton case.

At the suggestion of a correspondent who has been kind enough himself to furnish me with some information, I have written to the Record Office in England to see whether Capt. Fenton's petition for a pension as a Loyalist is on file there, and, if it is, whether it throws any light on the matter.

In the meantime let me assure "Fair Play" that I am unconscious of any bias. I am quite willing to cancel the passage in my history if Mme. de Riedesel's statement can be disproved. He does not charge me with misquoting Dr. Green, and I could not transfer the whole contents of Dr. Green's article to your columns. —Yours faithfully, Goldwin Smith.

Toronto, September 7, 1894.

# Notes.

Mr. Henry C. Lea has completed his work on 'Confession and Absolution,' and, as the revision of it is well under way, it cannot be long in going to the printer.

Mr. W. J. Linton will publish through the Scribners his reminiscences, 'Threescore Years and Ten' (1820–1890).

The 'Century Dictionary' will shortly be supplemented by 'The Century Cyclopædia of Names,' edited likewise by Benjamin E. Smith. Its field embraces history, biography, mythology, geography, along with ethnology, archæology, art, fiction, etc.

Roberts Bros. have nearly ready the first two volumes of a new edition of Molière's Dramatic Works translated by Miss Katharine Prescott Wormeley.

J. B. Lippincott Co., who have just issued Thiers's 'History of the Consulate,' in twelve volumes, propose to make a uniform edition in five monthly volumes, illustrated, of the same author's 'History of the French Revolution.'

Henry Holt & Co. are about to make a separate work of the historical and critical portions of Henry S. Pancoast's meritorious 'Representative English Literature,' with some rewriting and expansion.

A posthumous novel by the late dramatist, Steele Mackaye, entitled 'Father Ambrose: The Revelations of May 3, '68,' is in the press of Deshler Welch.

A new book by Max O'Rell (Paul Blouët), 'John Bull & Co.: The Great Colonial Branches of the Firm,' includes this country in the scope of its observations. It will be published by Charles L. Webster & Co.

Dodd, Mead & Co. will be, in connection with T. Fisher Unwin, the American publishers of G. H. Radford's 'Shylock and Others,' of which we lately made a brief approving mention.

'Meditations in Motley,' essays by Walter Blackburn Harte, is announced by the *Arena* Publishing Co., Boston.

Mr. Elkin Mathews parts company with his associate, Mr. Lane, at Michaelmas, but will still continue to publish at the well-known premises on Vigo Street, London. He also forsakes the emblem of the "Bodley Head."

'Anne of Geierstein' and 'Count Robert of Paris' are the twenty-third and twenty-fourth volumes respectively of the Dryburgh Waverley (Macmillan), with the customary handsome letter-press and uninspired illustrations. Another issue will complete the series.

Our recent elaborate notice of Morris and Magnússon's translation of the 'Heimskringla' dispenses us from reviewing the second volume, which has just been issued by Bernard Quaritch as the fourth in the handsome series of volumes of the "Saga Library." Nor need we do more than mention the seventh edition of Sweet's 'Anglo-Saxon Reader' (Oxford: Clarendon Press; New York: Macmillan), which has been enlarged and partly rewritten. The preface, which explains the changes and improvements in detail, has a characteristically independent personal note.

Mr. Wallace Bruce's 'Panorama of the Hudson' (New York: Bryant Literary Union) is an oblong volume, fitted for the pocket or the shawl-strap, and showing photographically with sufficient distinctness on opposite pages the east and west banks of the river as far as Albany. Such a companion will do much to relieve the monotony of the day's sail and save the asking of many questions.

We have received the third supplement to the catalogue of the Public Library at Taunton, Mass., and, if our estimate be correct, the number of books recorded exceeds by some 2,500 the original body of the parent catalogue. It is a rough but no doubt an adequate as well as inexpensive finding-list. From the University of California we have a classified list of books in the pedagogical section of the Library, filling 59 pages.

The second edition of 'Graduate Courses: A Hand-book for Graduate Students,' has been issued by the Graduate Club of Harvard University, C. A. Duniway, secretary, and is supplied at the nominal price of ten cents. It displays the courses of nineteen colleges and universities, and adds the names of the instructors with their scholastic pedigrees. This work is of such manifest utility that its endowment seems imperative.

The new edition of 'Johnson's Gardener's Dictionary' (London: George Bell & Sons) has been thoroughly revised by Messrs. C. H. Wright and D. Dewar. It contains the names of nearly all cultivated or useful plants, with a few words indicating their character, use, or method of culture. Interspersed with these names are horticultural directions of all sorts,

most of them doubtless good in their way, though some of them are rather amusing; for instance, the description of an ice-house reads as if it were designed by Robinson Crusoe. A good feature is the usually correct etymology of scientific names, which are also accented. The nomenclature follows Bentham and Hooker, as indeed it would naturally do when the editors gratefully acknowledge assistance readily accorded by the Kew botanists. If our magazine-writers would consult this useful book, they would learn to write *Wistaria* instead of *Wisteria*. "Gladi'olus" is given correctly, and so is "Cle'matis"; but Arbu'tus is surely an error.

It is difficult to see what principles of selection have guided Dr. Oliver R. Willis in preparing 'A Practical Flora for Schools and Colleges' (American Book Co.). The author claims to have made "a careful selection of the most important food-producing trees, shrubs, and herbs, including ornamental plants, fruits, nuts, medicinal plants, and those which furnish oils, dyes, lumber, textile fabrics, etc." Of course many plants would have to be omitted in a little book like this; but why ten American anemones and nineteen buttercups have a place, and not one lotus or water-lily, is not easy to understand. The articles on bananas, pineapples, cocoanuts, coffee, cotton, tea, melons, oranges, etc., are in the main satisfactory. Under the Blood Orange is the rather astonishing statement that "this form is more frequently taken on when the pomegranate stock is used, but occurs occasionally with regular stocks, and does not always appear when the pomegranate stock is used." Downing's note about Pliny's account of the tree in the garden of Lucullus is apropos here. This wonderful tree was grafted so as to yield olives, almonds, apples, pears, plums, figs, and dates!

'Le Commerce,' by Gustave François (Paris: Léon Chailley), is the second issue of a series of hand-books on "La Vie Nationale" edited by Charles Benoist and André Liesse. It is a natural companion to Bastable's 'Commerce of the Nations,' already noticed in these columns; for while Bastable's work deals primarily with the historical and economic aspects of the tariff question, François, after a brief but well-proportioned sketch of the history of commerce, confines himself to setting forth the relations of the Government to trade from the standpoint of administration. Thus his chapters on customs duties describe the methods of collecting duties, the classification and valuation of commodities, statistics of trade, etc. In referring to the revival of protectionism in recent years, François asserts that the exaggerations of the McKinley bill went ahead of anything yet accomplished by European protectionists. The last three chapters discuss commercial education. The author notes the absence of opportunities for higher commercial education in the United States, but makes no doubt that before long this country will possess institutions for the purpose as important as, and probably more prosperous than, those of the Old World.

'Eudes, Comte de Paris et Roi de France (882–898),' by Édouard Favre (Paris: Émile Bouillon), belongs to Prof. Giry's series of "Annales de l'Histoire de France à l'Époque Carolingienne," which, like the *Jahrbücher des Deutschen Reiches*, aims to collect all the authenticated facts of a period and to present them in rigorous chronological order with exact references to the sources. Favre has done this for the period of Eudes with a zeal and care which rival the best German efforts of the kind. In an appendix he gives a compact and convenient sketch of the Normans up to the tenth century. In another appendix he discusses the meaning of *Dux Francorum*, and shows that it should be rendered simply the Duke of the Franks. The correlative term, *ducatus regni*, meant an office (a sort of regency), not a territory. It is not proper to speak of a Duchy of France; there was no such territorial division, and the term arose from a mistaken combination of *ducatus regni* and *Dux Francorum*. Flodoard only once employs the phrase *ducatus Franciæ* in connection with Hugues le Grand, but the meaning there is clearly the same as that of the ordinary *ducatus regni*.

Another monograph giving abundant evidence of the painstaking research and conscientious use of materials which are distinguishing the younger school of French historians is 'Le Connétable de Lesdiguières,' by Ch. Dufayard (Paris: Hachette & Cie.). The author has laid under contribution national and local French and Italian archives, local histories and family papers to illustrate the career of Lesdiguières. Much new light is thrown upon the relations between the Huguenots of the south of France and the Government. In his preface M. Dufayard exposes the inadequacy and untrustworthiness of the nearly contemporary work of Videl, hitherto the chief authority on the life of Lesdiguières.

Mme. E. Caro's 'L'Idole' (Paris: Calmann Lévy) is a study, well wrought out, of a purely selfish character lost in admiration and worship of herself. In contrast to this central figure is the sweet profile of a young girl—a character becoming decidedly more common in French fiction—and a suffering, sensitive cripple, one of the numerous victims of the idol. Frère Angi, who is neither a brother nor an angel but a very commonplace braggart and coward, is happily touched off, and the background of anarchist intrigue lends a feeling of actuality to the story. It is prettily if not vigorously written.

A new edition of Arsène Houssaye's 'La Pécheresse' (Paris: Calmann Lévy) has been published. The story is that of the Life of Théophile de Viau, poet and dramatist. The book is well known, and, as it has been out of print for some time, this reissue will be appreciated.

The third volume of the Florentine lectures of 1893, "La Vita Italiana nel Cinquecento: Arte," contains two articles, such as one looks for in an encyclopædia, on Raphael and Michelangelo, by Signor Enrico Panzacchi and by the late John Addington Symonds respectively, one by Signor Tommaso Salvini on the theatre, and another by Signor Alessandro Biaggi on the music of the sixteenth century. To the reader, Salvini's lecture may be disappointing, but to the listener the recitation of considerable portions of Trissino's "Sofonisba," of Rucellai's "Oreste," and Machiavelli's "Clizia" revealed the great actor's appreciation of those plays. Signor Biaggi makes the interesting statement that, but for the cultivation in Florence of the musical drama, Palestrina's reforms might have led no further.

"A monthly gazette of the patriotic-hereditary societies of the United States of America" appears to have been called for, and at all events that is the definition of the *American Historical Register* just launched in Philadelphia by the Historical Register Publishing Company, under the chief editorship of Charles H. Browning of the American Historical Association. Twenty-one other societies are represented by the associate editors, and the leading paper is on yet another, viz., the Association for the Preservation of Virginia Antiquities; and the celebrations and proceedings of such societies are to be printed in the *Register*. In the way of illustrations, miniatures seem likely to be numerous, and an autograph letter of Washington's in facsimile opens a department in this line.

Prof. H. P. Bowditch of the Harvard Medical School answers in *McClure's Magazine* for September the question, "Are Composite Photographs Typical Pictures?" with some very interesting illustrations, in which American physicians, car conductors and drivers, and Saxon and Wend soldiers are portrayed to the life and in the composite abstraction. The conclusion is that the process is well worth pursuing as an aid to ethnological research. The writer gives instructions for a simple method of making composites.

The Paris *Journal des Débats* of August 25 prints side by side a news item regarding a movement in the Department of the Nord to forbid the employment of female compositors in printing-houses, on a philanthropic sanitary pretence, and a note on the first women's printing-house, which carries us back four centuries, to Italy. The religious of a convent of St. James belonging to the Dominican Order had thriven by the copying and illuminating of manuscripts. The invention of printing threatened them with ruin, from which they were rescued by learning and betaking themselves to the new art. More than a hundred works issued from their press from 1476 to 1484, one of them being an edition of the 'Decameron,' dated 1478.

By an oversight in our last issue, on p. 177, "Prince Wolkowski" was printed for Volkonsky, Assistant Minister of Public Education in Russia.

—For some months a collection of sketches described as the work of John Trumbull has been offered for sale by a reputable book firm in New York city. When the announcement was first made there was much expectancy among experts and collectors, but the appearance of the catalogue dampened this, and the collection itself went far to dissipate it. The price asked for the entire collection—122 pieces in all—was $15,000; a few months later it was $10,000; and now, under a new catalogue, it has come down to $8,000, and individual lots may be purchased at varying prices. If this last quotation is a fair one, the others were exorbitant; but the price is not so much in question as the authenticity of the sketches. The evidence adduced by the present owner is singularly meagre. The collection "is believed" to have remained in the possession of Trumbull until about 1824. It then passed into the hands of a Virginian, a close friend of Trumbull, from whose grandchildren they were recently obtained. In the first catalogue issued Trumbull is said to have parted with the collection "for personal reasons," presumably pecuniary, though for eight years Trumbull had been receiving from Congress an average payment of $4,000 per annum on account of his Capitol paintings; and the Virginian is described as having been "connected with Congress for a number of years." These assertions are not repeated in the new catalogue. "The authenticity of the collection is attested by experts," of the first notice, is much elaborated in the second, where the authenticity is "fully and emphatically guaranteed"; "has been recognized by artists

familiar with his work," "difficult if not impossible to ascribe to any one else," etc., etc.

—It may be admitted at once that if these are Trumbull sketches, they possess a high monetary if not a high historical value. But the claims made in their behalf should receive a closer examination than the present owner has given them. Who are the experts who have passed on the question? One is known to be a gentleman whose opinion on art is worthy of all credence; but he has frankly admitted that the sketches could not have been drawn from life, and certainly not in 1776, and in no case are equal to the artist's general work. The other "experts" are unknown to us. Why conceal the name of the Virginian who received them from Trumbull? It is said he was one Col. Mosier, or Mosher, of Washington; but a descendant of Col. Mosier fails to have any recollection of such sketches being in the family—a remarkable lapse of memory, as the drawings were supposed to have been framed about 1824, and, therefore, unlikely to have been hid away in a garret. Then as to the identification of the drawings, some further doubt is presented. The owner claims that the pencilled names on the back are "for the greater part" in Trumbull's hand. That should be a strong bit of testimony but for the fact that some of the "mems." have been found to be wrong; and would it be likely for the artist to have mistaken his subjects? As no sketches by Trumbull of an early date are known to exist, comparison is impossible; yet it is just to ask that better evidence of the authenticity of such crude, badly drawn, and worse proportioned sketches, dealing often with trivial matters, should be furnished than irrelevant quotations from Trumbull's autobiography, and "guesses" of an owner desirous to sell. One of the early paintings of Trumbull is that of the Governor and Faith Trumbull, now in Norwich, Connecticut. It was probably done before the Revolution, as the face of "Brother Jonathan" is more youthful than other known portraits of him. The artist who painted this pair of portraits could not have perpetrated such pieces as these sketches. Many of the arguments of the cataloguer could be directed against his claims. If "artistic and military propriety" would prevent Trumbull from picturing Washington with Arnold after 1780, what can be said of the propriety of drawing Washington "in undress uniform," supporting Miss Pollock, "who presses her head against his shoulder, in fear," while Putnam on a ladder without is blowing a horn! Who were the Pollocks, drawn in more than one picture? If these sketches were done in Cambridge, no Pollock family is recorded thereabouts. What can we say of the drawing of Washington, "a delegate to Philadelphia, May 2nd, 1786, one of 7 from Virginia, to examine the Trade of U. S."?

—'The Geographical Distribution of the Vote of the Thirteen States on the Federal Constitution,' by Orin Grant Libby of the University of Wisconsin, is a valuable and exceedingly interesting study of causes and effects, political, geographical, and social. The influences which worked for and against the Constitution have generally been regarded as those of States; but Mr. Libby now demonstrates that there were wheels within wheels—geographical divisions within State lines which operated with almost as much directness and precision as if these communities had been independent bodies-politic. Massachusetts is generally supposed to have been a strong Federal State, but Mr. Libby's analysis shows that the vote in the State convention for ratifying the Federal Constitution was cast in these proportions:

"Eastern section—Yeas, 73 per cent.; nays, 27 per cent.
"Middle section—Yeas, 14 per cent.; nays, 86 per cent.
"Western section—Yeas, 42 per cent.; nays, 58 per cent."

The eastern section included the coast, the commercial interests, and substantially all the towns; the middle was the theatre of Shays's rebellion; the western was the mountain region west of the Connecticut, the frontier. New York, again, is always regarded as having been a close State, but its division was almost absolutely geographical. All of the counties west of the Hudson and north of Dutchess gave but one single vote in favor of the Constitution. Dutchess elected anti-Federal delegates, but was nearly equally divided. All of the region south of Dutchess and east of the Hudson was almost unanimously Federal. When the Convention assembled, a majority of the delegates were in the opposition, and the Constitution was saved by a few delegates from the wavering counties of Dutchess, Queens, and Suffolk, who, enlightened by the debates, and conscious of a changing sentiment at home, broke away from their party and secured the ratification which they had been elected to oppose. This study forms a pamphlet of 116 pages, with two maps showing the distribution of the vote in 1788 and of the population in 1790. It is issued as a Bulletin of the University of Wisconsin, and is a thoroughly creditable piece of work, both as regards the University and the author.

—We deeply regret to record the death on September 4 of James Clarke Welling, for many years and up to the present moment one of our most valued contributors. Mr. Welling was a native of New Jersey, having been born at Trenton, July 14, 1825, and he graduated at Princeton in 1844. His profession was the law, but he quickly abandoned it for teaching and journalism, in which pursuits, either separately or in combination, he found his life work; yet law remained his favorite chair. He began journalist in connection with Gales & Seaton, at Washington, while that capital still boasted a paper having a national reputation and influence. At the close of the civil war he renewed his career as an educator, at first as president of St. John's College, at Annapolis, Md., afterwards for one year as professor of belles-lettres at Princeton, and finally, in 1871, as president of Columbian College (now University) in Washington. His administrative powers found here a fine field for their exercise during a quarter of a century, and he left the institution in a most flourishing condition. The public estimation in which he was held was evinced by his election as president of the board of trustees of the Corcoran Gallery, and one of the regents and chairman of the executive committee of the Smithsonian Institution. He was also an active member and presiding officer of several learned societies in the District. His scholarship was very extensive, and in the field of modern American history he had few rivals in ready and accurate information. As a controversial writer he was formidable, and it was in this capacity that, in 1875, he made his début in the *Nation* as a champion of Prof. Henry, in a review of Tyndall's work on 'Sound.' Since 1886 his contributions to the *Nation* have been constant, and chiefly in the line of our political history.

—President Welling was possessed of a very genial temperament which masked his age. Had he been sooner freed from the charge of the University, we have little doubt that his life would have been considerably prolonged. We quote from a letter dated Washington, February 12, 1894, which shows his consciousness of overwork, while a hope is indulged of further literary achievement. The specific labor he had in mind was worthy of his experience and peculiar abilities, and it is much to be feared that no one equally competent will be found to undertake it. He thus wrote:

"As one of your 'hands,' I think that I ought to tell you that I have resigned the presidency of this University, to take effect at the end of the current scholastic year in June. I shall probably betake myself to my summer home in Hartford, and live there throughout the whole year, though I *may* return to Washington, every winter, to deliver my annual lectures on International Law before our Law School. With over a hundred and fifty men in our Faculty, I find the cares of administration very carking, and I am glad to shift the burden on other shoulders. Besides, I have some literary work to which I shall devote the residue of my days. I purpose to write the Civil History of our Civil War. As this task-work will leave some intervals of time for other 'diversions,' I will lend my pen to you as opportunity may offer. I was the Literary Editor of the old *National Intelligencer* before I assumed its political conduct in the year 1858."

—Prof. Joseph Hyrtl, who died at Perchtolsdorf, near Vienna, on July 17, was not only a distinguished anatomist, but also a very original character. He was born December 7, 1810, at Eisenstadt, and was the son of a musician who belonged to the Esterházy orchestra of which Joseph Haydn was the conductor. The boy devoted himself at first to music, but soon decided to study medicine. In 1836, at the early age of twenty-six, he was appointed to the professorship of anatomy in the University of Vienna, and held this position until 1874, when he tendered his resignation and withdrew to the suburban village in which he died and where, owing to his secluded life, he was generally known as "the hermit of Perchtolsdorf." In his retirement he continued to pursue his scientific studies with unabated zeal, and published numerous monographs containing the results of his researches, especially in comparative anatomy. He even learned Arabic and Hebrew in order to be able to read in the original the writings of Moorish and Jewish physicians. He is best known abroad by his 'Lehrbuch der Anatomie des Menschen,' which was issued in 1846 and has passed through thirty editions, besides being translated into all the principal languages of Europe. Hyrtl's lectures were exceedingly attractive; he was a master of lucid exposition, which he enlivened with an undercurrent of quiet humor, and occasionally enlightened with sudden flashes of wit. Once at an examination he asked the following question: "What can you tell me of the functions of the spleen?" The student, not wishing to confess his ignorance, replied hesitatingly: "I used to know, but it has unfortunately escaped me." "Unhappy man!" said Hyrtl; "you are the only one who ever knew anything about it, and you have forgotten it." At another time the candidate, a Jew named Jerusalem, failed to pass the examination. His friends were anxiously awaiting the result in an antechamber, when Hyrtl, going out, took in the situation at a glance and exclaimed in the words of Jeremiah: "Weep, O Israel! Jerusalem has fallen." Countless anec-

dotes of this kind might be told of him. With all the keenness of his sarcasm, Hyrtl was a remarkably tender-hearted man, and spent money without stint for charitable purposes, and especially for the education of poor children. In his last will and testament, after setting apart considerable sums for scientific investigations and generously remembering the village of Perchtolsdorf, he made the orphan asylum of Mödling the sole heir of the rest of his estate, amounting to more than half a million of florins, on the condition that it should pay a life annuity to his widow.

—Under the title, 'Crazy Book-collecting,' the Grolier Club has issued in a small, neat, rough-edged volume, a translation of 'De la Bibliomanie,' written by Boullioud-Mermet of the Lyons Academy, and published anonymously in 1761. It is recorded that Mr. Caudle obtained needed repose, after the decease of his spouse, by setting down with pen and ink the substance of her nocturnal admonitions, but we never heard that he got out an *édition de luxe* for presentation to his friends. Whatever the motive—whether good-humored tolerance or the wish for that manner of comfort which the English duke found in responding to the Decalogue, "Never did that, never did that," or a genuine conviction of sin—in any case the resulting booklet, decorously enlivened by its pink end-papers, is outwardly attractive, while its matter will serve to pass an idle hour to more advantage than the latest novel. It is a serving up, in an old-fashioned manner, with garnishings from the classics, of the time-honored complaints against the book-collector, wherein are denounced, sensibly enough, what were, and doubtless are, real evils; but, for effect, a treatise on the irregularity of the moon's motion will about as quickly amend the ways of our satellite. The most notable thing in the book, to a modern reader, is recurring exception, from many of the animadversions, expressly allowed to "princes or nobles." A preface in rebuttal—the bull is not chargeable to us—presumably by the translator, closes with an invitation to Grangerizers which we take to be a refinement of revenge upon the author.

## MORE FICTION.

*Pan Michael.* By Henryk Sienkiewicz. Translated from the Polish by Jeremiah Curtin. Boston: Little, Brown & Co.

*A Journey in Other Worlds.* By John Jacob Astor. D. Appleton & Co.

*The Wings of Icarus.* By Laurence Alma-Tadema. Macmillan.

*A Suburban Pastoral*, and Other Tales. By Henry A. Beers. Henry Holt & Co.

*Tales of the Maine Coast.* By Noah Brooks. Charles Scribner's Sons.

*The Exiles*, and Other Stories. By Richard Harding Davis. Harper & Bros.

*A Pound of Cure.* By William Henry Bishop. Charles Scribner's Sons.

*An Interloper.* By Frances Mary Peard. Harper & Bros.

*The Man in Black.* By Stanley J. Weyman. Cassell Publishing Co.

*Under the Red Robe.* By Stanley J. Weyman. Longmans.

*Mary Fenwick's Daughter.* By Beatrice Whitby, author of 'The Awakening of Mary Fenwick.' D. Appleton & Co.

WITH the history of 'Pan Michael,' Sienkiewicz closes the series of historical novels relating to the wars of the Polish Commonwealth. As the Cossack wars and the Swedish invasion were the subjects of the preceding books ('With Fire and Sword' and 'The Deluge'), so in 'Pan Michael' the recital is of the Turkish attack upon the Commonwealth. A truce from wars, however, and a long encampment give ample leisure for the adjustment of Pan Michael's love affairs before battles begin. In love and war he is aided and abetted by Pan Zagloba, the Falstaffian hero of the earlier novels, who is still the same delightful braggart, busybody, and wit as of old, the pet and the derision of the Commonwealth. There is no falling off in interest in this third and last book of the series; again Sienkiewicz looms as one of the great novel-writers of the world. He has infinite patience in historic research, utmost skill in elaboration of detail, remarkable power of creating character, and a distinguishing ability to make the past seem present. To these equipments is added an insight into inner sources of conduct which are of no people or time but of humanity itself—an insight so subtle as to proclaim him a master equally in analysis and in narrative. The fruit of such powers is a romance which will captivate even him who reads for history; a tale of battles which will moisten the eye of the lover of love stories.

The heroes of the previous numbers of this trilogy of novels appear now in long-wedded unimportance, and "Pan Michael" is the centre of the story—the "little knight," with moustaches ever quivering with excitement, fiery in his zeal for his country, "the swordsman above swordsmen, with the heart of a dove." It would be almost true to say that his sabre is the hero, for it carries as large a share of the action as if it were indeed alive and possessed of a potent personality. The heroine, Basia, that tender-hearted hoyden, is one more proof that Sienkiewicz's inventive powers have no limit. Yet his inventions are always possible, for, wide as is his scope, he keeps ever a wary eye upon human nature, like one of his own hetmans, who, though planning a nation's campaigns, is always a tender father to each of his soldier knights. In a fast-enlarging crowd of fiction-writers one reads and balances and pronounces, but when a Sienkiewicz comes, the judgment stands up, and, freed from all office but that of recognition, says, "Here is genius." If the halo is ever seen to be askew, it is in matters where the tastes and sensibilities of races differ. There are pages of description of bodily torture which the most honest translator might have been pardoned for omitting.

The leading motive of Mr. Astor's 'Journey in Other Worlds' is sounded in the preface, where, after settling in a few breezy sentences "the protracted struggle between science and the classics" in favor of the former, he goes on to say: "How much more interesting it would be if, instead of reiterating our past achievements, the magazines and literature of the period should devote their consideration to what we do not know!" This book is all about what we do not know, therefore a potent plea for the strictly scientific. To do the argument justice, the speculations as to the state of the universe in the year 2000 A. D. are founded in part upon the discoveries and inventions of the present time. Electricity, for example, supersedes animal motive power; the baleful germ has been harnessed to man's use and made to slay the superfluous rabbit and the objectionable serpent. Perfect pavements, really rapid transit, rain-making, navigation by electricity and tides (without boilers, engines, sails, or sea-sickness), marine spiders, or ships spinning on many legs over the ocean's surface, air vessels, coast-making and valley-filling, the straightening of the earth's axis (in order to produce an equable climate) by pumping out the waters at the poles alternately—are among the accomplished facts of the next century, based on principles known to this, and all are explained in convincing detail. But new forces are discovered also; and chiefly apergy, which annuls gravitation, and which, yoked with gravitation, enables three en- and ap-ergetic gentlemen to visit Jupiter and Saturn and return to earth. Many of their adventures are very entertaining and suggestive. There are discoveries for all—for the boy who used to read Mayne Reid; for the adult whose tastes incline him to Jules Verne or to the astronomic flights of Flammarion; for the botanist, the hunter, the inventor, the scientist, and for the theologian who loves to speculate on the place of departed spirits. There is food for all, or, if any one goes away from the banquet hungry, it will be the poet. This is what a Vassar girl of the twenty-first century writes under her lover's photograph:

> "Did you but know how I love you,
> No more silly things would you ask.
> With my whole heart and soul I adore you,
> Idiot! Goose! Bombast!"

The conclusion of Laurence Alma-Tadema's story is a pity, for up to the last moments it is a book of unusual vital force. A more honest photograph has never been made than of Emilia Fletcher's mind: of her morbid weakness, her heroic power, her grief, doubts, fears; of her friendships, hypocrisies, tendernesses; of her love, pride, and jealousy; of her recklessness and cowardice. The world is ear-deep in love-stories—so deep that the reader well-nigh forgets that there remains a possibility of finding distinction in any, till now and then, as in the present instance, there appears one written with that greatest distinction, the truth, and with a living pulse-beat instead of the mechanical or conventional action that usually does duty for nature. So much may be said for the Letters and Journal which tell the first part of Emilia's story. The postscript opens well, but ends in an artistic no less than a moral collapse, disappointing to the interest awakened by an evident and original talent.

Mr. Beers's stories are of light calibre, and abound in modern college speech and thought. His college men talk with naturalness and in a bright, gay, semi-cynical vein which makes their conversations entertaining, particularly those among themselves. When they are in ladies' society, they are neither so clever nor so agreeable. The descriptions of nature, in which the pages are rich, are made with a light yet intimate touch. One recognizes a student, almost a discoverer, of the pastoral as found not far from the madding crowd, in the suburban field, the cedar-girt cemetery, the unimproved city lot. The author is skilled in leading the reader into surprises, and he has the latter-day love of the indeterminate. Sometimes the twilight of his conclusions seems to come from the instinct of the artist, sometimes from that of the perfectly good-tempered and humorous pessimist; the poet and the collegian are yoked rather than fused—the stories have always a two fold flavor. Whether or no the plot is ingenious, and it frequently is, the atmosphere is always markedly that of the reader of books, the lover of nature, and the delineator of humanity. The books reflected are the best, the nature is the half-reclaimed, and the humanity, shall we say? lies between the two.

Mr. Brooks's tales of the Maine coast are as pleasantly redolent of brine and tar as an ocean voyage; of East Indian spices and per-

fumes as a grand-maternal chest in an attic; of village oddities as only an old coast town can be. In such a community the native quintessence is heightened instead of lessened by touch with the farthest ends of the earth. The carved whale's tooth and the bunch of red coral that the sailor lad carries home only bring out afresh the local coloring of the New England amphibious town. Adventure rather than character is the phase emphasized by Mr. Brooks, although a harmonious balance is held between the two, while the style is that of the capable, competent writer.

"Perhaps it may turn out a sang, Perhaps turn out a sermon," was not spoken of Richard Harding Davis's stories, but might have been. Under the airy, all but frivolous manner, under the detail, the localisms, the light-hearted realism, lies often what we will not call by so dry a name as a moral, still less a purpose; a hint, let us rather say, at the soul of evil or good in things good or evil, that sets one to thinking the deeper because unexpectedly. The sermon, be it said, is never preached. The story is trilled forth, and the listener helps himself to song, sermon, or both. "The Exiles" is the strongest story Mr. Davis has written, and is an achievement of real power—a tale calculated to give pause to those who either defy or deify public opinion. "His Bad Angel," too, is a holding up of the mirror to Nature's motive springs, and has no little suggestive force. If we are prompted by these stories to think that Mr. Davis succeeds best where he is saying most, there is temptation to reverse the opinion in reading "The Right of Way," which turns out a song, and is a gay little piece of student fun on the Avon River. Our brothers the Hefty Burke and the Van Bibber reappear in other stories, at their most distinctive, but in fresh situations; nor are new and attractive acquaintances lacking. The subjunctive and will-and-shall proof-reader has hardly had his share in this attractive and original volume.

Mr. Bishop's story of Monte Carlo is strong and effective as a picture of the gambling passion, and full of charming little "murmurs and scents" of the Mediterranean shore. The glimpses of a child are pretty and true. The characters of the good and the evil angels are somewhat indistinct, but they serve, since the story is rather of the irresistible force of opportunity in a temptation once yielded to than of any human influences for or against it. The writing, as might have been expected, is expressive and highly trained.

A comfortable, old-fashioned story, based on comfortable, old-fashioned lines, is Miss Peard's story of an alliance between a bourgeoise and a scion of the oldest noblesse of France, with the not wholly unexpected result of the bourgeoise proving to be much the better half. The perplexities and mysteries and troubles belong to an old but good school of fiction, freshened with a new device or two. The reader ambles alongside in cheerfully familiar suspense and well-worn luxury of woe. There is always extreme smoothness and refinement in Miss Peard's style and material. In 'An Interloper' there are these, and there are several notably well-drawn personalities. The child is truly a child, with no poses; the old bourgeois father, the *dévote* sister-in-law, the Parisian advocate, are excellently distinct. The interest, moreover, deepens and culminates in satisfactory fashion. Breathes there a novel-reader with soul so dead who does not love a court-room and a trial?

The pen that wrote 'Francis Cludde' finds a public more than ready for its fresh ventures. Nor will that public suffer a disappointment in reading 'The Man in Black' and 'Under the Red Robe.' Both are stories of the time of Richelieu, and both clamor to be read when once begun. They are well-knit in their make; they are romantic without feebleness, and stirring without bombast, and they are sweet and clean.

Miss Whitby has introduced a novel character in the daughter of Mary Fenwick, and although she has been sparing in exasperating allusions to the scenes in which Mary Fenwick the first lived and moved, we are led to wonder why, in view of her abundant resources, all the characters could not have come fresh from the author's hand. As a study of heredity there is a lack of vividness and definiteness, partly due, perhaps, to the very limitations which a sequel imposes. As a tale pure and simple this sequel pictures well-to-do English country life, with its inevitable accompaniments of hunting, golfing, and other sports, naturally and pleasantly, and without too many field and stable euphuisms. Cupid enters the lists against the energetic and defiant Diana of a heroine, but without success until she is put *hors de combat* by a runaway horse and a frightful accident. After two years or more of helplessness ministered to by a lover faithful from childhood, the vanquished Diana falls a victim to matrimony, and develops into a British matron of a rather unusual type, one who "likes to have her husband make up her mind for her," and even becomes inspired with "reverence" for a mother-in-law whose spiteful, meddlesome character the author has clearly set forth.

A lack of humor sometimes allows Miss Whitby's pen to slip into bathos, and a morbid fancy for quotation-marks awakens the uncomfortable suspicion that the most commonplace expressions require endorsement. For if we are not to make use, for example—and it is by no means an isolated one—of such an innocent phrase as "make her little finger ache," without fencing it off with inverted commas, what a future lies before us! The numerous typographical errors are downright amusing, though some people may not care for that sort of entertainment.

## MR. GOLDWIN SMITH'S TRANSLATIONS FROM THE GREEK TRAGEDIANS.—II.

*Specimens of Greek Tragedy.* Translated by Goldwin Smith, D.C.L. Æschylus and Sophocles; Euripides. 2 vols. Macmillan & Co.

THERE is no doubt a strong temptation to translate line for line, and there is also in the Greek dramatic dialogue a balancing and numbering of lines which it is pleasant to detect, and which was one of the golden chains that tragedy moved in and decked itself withal. In the choral odes, balance and number are carried out with mathematical accuracy; yet Mr. Smith is ready to dispense completely with the choruses, which exhibit this peculiarity in perfection. In the dialogue we may certainly dispense with a nicety which can only be discovered by counting, which is unknown in English, and which is a heavy strain on the translator. Our problem must not be overloaded with difficulties—we must not carry too many chains. The main object of a metrical translation is evidently to reproduce something more than the thought and the matter—the mere body—of the original. These can be given satisfactorily in prose. The aim of the metrical version must be to suggest also other qualities of the original, its felicities of phrase, its rhythm, its musical language, its soul of beauty; and the very terms of the problem require that these shall be expressed or suggested in rhythms and melodies and beauties, native to the new language, though akin, if possible, to the old.

Now it is quite plain that the translator who sets himself the task of following the original line for line, or word for word, shackles himself at the outset by undertaking to accompany the precise pace and movement of an alien Pegasus. If he has a real poetic gift, he handicaps himself, just as Longfellow, for many plausible reasons, handicapped himself regrettably in his version of the 'Divina Commedia.' The process of Chapman and of FitzGerald was different from this. Each of these charged himself with the spirit of his author, and, after a deep draught of inspiration, poured forth the message that was in him. In spirit, in power, in fire and passion, the result was faithful to the original; in language, it was delivered from the fetters of individual lines, or words, or phrases. It was inspired, but the inspiration was not verbal. FitzGerald, as he confesses, was "haunted by the ghost of Agamemnon until he laid it." Chapman's style had some of the freaks of his period; FitzGerald, on the other hand, had "the feminine of genius," as he calls it—taste. He had, moreover, the professional equipment which even a poet requires, if he is to write any kind of verse that has a history in the English language. He had, of course, studied his Shakspere as every gentleman and scholar does; but he had gone much further: he had lived in the society of the Elizabethan poets, and absorbed in his ear the cadences of Webster and Ford, and the imaginative diction of Marlowe; and so he had mastered the difficult secret of blank verse, of its long melodious periods, its intricate and varied music, which are quite a match in charm and freedom and power for the Homeric hexameter and the Attic trimeter. Finally, he was, in spite of his own vehement denials, a poet, though not strongly creative; hence he was willing to be a satellite—to shine with a borrowed light.

Now, Mr. Smith is not, like Chapman or FitzGerald, "haunted" by his author; he is not exactly inspired. He is simply working deliberately at a problem which he solves with finish and general success. We are tempted to examine minutely workmanship of this kind; and a minute examination reveals here and there little flaws and specks in the execution. One might take, for example, that fiery speech of *Medea*, in which, *more Euripideo*, she lashes herself into a reasoning and most reasonable rage against *Jason*. It is by no means Mr. Smith's best piece of work, and that is the reason it serves us here for an illustration. One might pick holes in it; one might remark, Here *Jason* says something ridiculous which Euripides never put in his mouth; here, again, a strong line is weakened; here an important phrase is omitted; here is a slight misrepresentation; here a lapse into prose; here some careless, lisping lines harsher than the "sigmatism" which *Medea* permits herself, with good reason, against her betrayer. But all this prying and piddling leads to nothing. Every one of these slips might be mended and there would still be the same general complaint to make. These minute criticisms which a scholar might make would be of small moment to the English reader, if the general sweep of the translation were as impassioned, dramatic, and musical as the original. The original is a strong passage, which reads and declaims admirably.

but it is by no means unapproachable. In point of fact, Mr. Smith was here more literal than usual; and this, perhaps, was his temptation. In feeling about after the Greek, and taking it word for word, he missed somewhat the flow and passion; he was not at all inspired; he was trying—perhaps, in a listless mood—to work out an equation between two languages.

This "conscientious fidelity under which the original drags and labors" is exactly what FitzGerald deprecates for the class of readers who, after all, are most deeply concerned—those who have no Greek or Spanish or Persian, as the case may be. The present writer will probably never read the Persian of Omar Khayyám; but he is profoundly grateful for the quatrains which revealed to him the fascinations of that Oriental Anacreon whose song has a strain of the splendid melancholy of Lucretius. He does not greatly care whether FitzGerald rendered line for line, or could take his oath to every word and phrase and metaphor. He knows that he can resort to some prose version, and verify at his leisure the precise terms of the original document. On the other hand, he feels sure that the quatrains have given him a true glimpse of an enchanted land that is very far off, that they have reproduced for him the spirit of some strange and powerful original, with all its spell of phrase and melody and rhythm. So, too, in the daring versions of the "Agamemnon" and his combination of the two plays that bear the name of "Oedipus." In these FitzGerald certainly cut loose from "conscientious fidelity"; he took great liberties; he released his text from some bits of antiquity and archæology which require a running commentary to understand; he bound himself fast to genuine English dramatic forms. But did he really miss the quintessence of the Greek spirit, and beauty and sublimity, the atmosphere and color of Greek tragedy? No more, we think, than he missed the Oriental color and enchantment in the quatrain and in "Salaman and Absal." Out of all the experiments that have yet been made, we should still venture to place in the hands of the unlearned reader his paraphrase of the "Agamemnon." With the aid of this and of a good prose translation, he might safely correct his calculations, and divine the planet he has never seen.

Such a reader might guess how much, after all, he loses in the best prose rendering. Take, for example, the lullaby in the "Philoctetes," which runs in liquid melody, and is expressed in a few magic words that haunt the imagination like one of Shakspere's songs. Turned into prose, what becomes of it? It is like the transformation of those sheeny grasses and iridescent shells one sees waving or moving in the liquid light of some rock pool. You take them out and arrange them on cards or in a cabinet; you may be able to make affidavit to the scientific integrity of every particle of the objects; but what has happened? The splendor, the enchanting colors, the life and motion, are clean gone. The things are dead—they are no longer in their element. This magic element—this vehicle which transforms and beautifies all that lives and moves in it—is what the poet gives and the rhetorician denies.

A single brief extract will illustrate the difference between the conscientious, line-for-line method, and the poetical method, permitting itself some license. Clytæmnestra has just openly avowed her murderous plot, and, in reply to the reproaches of the chorus, dares them to do their worst. The versions run as follows:

Prof. Smith's:

"Yea, thy award to me is banishment
And execration and the people's curse,
But no such measure didst thou mete this man
When recklessly as it had been a beast,
While in the pastures sheep were numberless,
He sacrificed his child, the dearest child
That I had borne, to charm the Thracian gales.
*Him from the land to drive for his foul deed*
*Thy justice moved thee not.* But now I come
Before the bar, the judge is merciless.
I warn thee that thy threats are launched at one
Who, if thou canst in equal combat win,
Will yield; but should heaven otherwise ordain,
Thou mayst too late be put to wisdom's school."

FitzGerald's:

"Aye, aye, to me how lightly you adjudge
Exile or death, and never had a word
Of counter-condemnation for him there;
Who, when the field throve with the proper flock
For sacrifice, forsooth let be the beast,
And with his own hand his own innocent
Blood, and the darling passion of my womb—
Her slew—to lull a peevish wind of Thrace.
And him who curs'd the city with that crime
You hail with acclamation; but on me,
Who only do the work you should have done,
You turn the axe of condemnation. Well;
Threaten you me, I take the challenge up;
Here stand we face to face; win thou the game,
And take the stake you aim at; but if I—
Then, by the Godhead that for me decides,
Another lesson you shall learn, though late."

Each passage is, we think, fairly characteristic. Mr. Smith's is scholarly, it follows the Greek almost line for line; it is close without being slavish, and it is, as a matter of course, expressed in forcible, idiomatic English. If now we read aloud—or, if an actor reads aloud—FitzGerald's lines, we discover, first of all, that they were written to be acted, that the lines move with the speaker, that the passage is naturally dramatic. It is alive with all the fire and passion and daring of the "man-mettled" queen. It is, moreover, entirely spontaneous English, taking its mould from nothing but English models, and suggesting no hidden constraint like the lines we have italicized in Mr. Smith's version, which we venture to say would never have been written as they are except under the dictation of the Greek order and syntax. It treats the original with some freedom, yet it preserves all the meaning; it preserves, too, that fine imaginative phrase (φιλτάτην ἐμοὶ ὠδίν') which Mr. Smith found it in his heart to commute for matter-of-fact prose.

Our conclusion is briefly this: There is room and use for translations in prose as well as verse; each may present certain phases which can hardly be exhibited in perfection by the other. But a translation in verse should, if possible, result in a poem, and should, therefore—if you can catch him—be done by a poet. Moreover, when you catch him, you must not bind him down by too hard-and-fast conditions, but let him have somewhat free play in the forms of his native language, and under the influence of a sort of secondary inspiration. Otherwise you clip his wings, and your version lumbers, and the critics point out how preferable is prose to verse in translations. And since born poets are so rare and shy creatures to catch, and so whimsical and balky, as a rule, in harness, let us be thankful when an adroit master of the resources of our English speech like Prof. Smith finds leisure to step in and serve us.

## THE BRITISH FORTIETH.

*Historical Records of the Fortieth (Second Somersetshire) Regiment*, now First Battalion, the Prince of Wales's Volunteers (South Lancashire Regiment), from its formation in 1717 to 1893. By Capt. R. H. Raymond Smythies, First Bat., P. W. V. (S. Lan. Reg.). Devonport. 1894. Thirty-three full-page illustrations. 8vo, pp. 640.

No regiment in the British army has such a peculiar claim on the interest of Americans as the one of which the above work is an account. Originally formed in this country, it has been closely connected with our military history from the early part of the last century down to the close of the war of 1812 and the capture of Fort Bowyer in Mobile Bay. From that time it contributes to the annals of English prowess and conquest in nearly every quarter of the world. Its career has been singularly fortunate. In the long series of actions in which it was engaged, we do not remember that it was in one notable defeat, nor did it lose by capture any considerable number, except four companies at Canso in 1744, through no fault of their own, and one in Newfoundland in 1762. On the other hand, nineteen honors are inscribed on its colors, outnumbering those of every regiment of but one battalion in the army, and amply justifying its familiar title, "The Excellers" (XLers). It is to be deeply regretted that this title, the Fortieth, by which it is known in history, should be lost in the merely territorial designation which the recent reorganization of the army requires. "The loss of individuality and of connection with the past can in no regiment have been greater and in none more keenly felt."

Capt. Raymond Smythies has not attempted to make of the abundant material which he has gathered from every source for his work a connected narrative. Under each year he has given briefly the movements and services of the regiment in that interval and every few years its roster. Much of this detail is necessarily dry and unappetizing, but wherever an opportunity occurs to insert a personal account of some noteworthy action, the author has skilfully used it. These accounts are drawn in several instances from manuscript sources. It was in the year 1717 that the regiment was formed out of the eight companies which at that time garrisoned the frontier posts of Nova Scotia and Newfoundland. The only one of its original officers who attained any particular distinction was Capt. (afterwards Gen.) Paul Mascarene, a Huguenot refugee, who was acting governor of Nova Scotia during the most critical period of its history. For nearly half a century it performed garrison duty, neglected, as was too common in those days with regiments on foreign service, by the home Government and its honorary commanders. At times the soldiers were even dependent upon the private means of their officers for food and clothing, and the companies dwindled away each to a few decrepit old men. Yet even in this condition it laid the foundations of its reputation as the "Fighting Fortieth" by beating back from the crumbling walls of Annapolis Royal, in two successive years, an overwhelming force of French and Indians. Its long series of distinctions began with the second siege of Louisburg in 1758, when the detachment of which it formed a part, under Gen. Wolfe, succeeded in making a landing despite the heavy surf and the hot fire of the enemy. The following year its grenadiers joined in the brilliant, though rash and unsuccessful, attack on the fortifications of Quebec, which called out a severe rebuke from the commanding general. This error they retrieved on the Heights of Abraham when they made the final charge upon the French with Wolfe at their head. The regiment was present at the capture of Montreal, where it remained in garrison until the summer of 1761, when it was withdrawn to take part in the expedition against the French and Spanish West Indies.

The siege of Havana, during which it lost

heavily, was the next important service on which it was engaged. After the restoration of this place to Spain in 1763, the regiment returned to Nova Scotia, and in the following year was transferred to Ireland. Here it was stationed till the spring of 1775, when it was ordered to America, arriving at Boston the week after the battle of Bunker Hill. At this time it numbered 475 men, but the hardships of the following winter considerably reduced its strength. On the evacuation of Boston, the British army went to Halifax, whence a detachment of the regiment consisting of 170 men was immediately sent to Georgia to obtain rice for the forces. This was not accomplished without some difficulty, as the rebellious townspeople of Savannah refused supplies. Consequently "a detachment was sent up the Back River in boats, which succeeded in carrying off eighteen vessels of grain, whilst the attention of the inhabitants was attracted by the larger vessels, which made a feint up the ordinary passage." Among the losses reported in Gen. Howe's despatch, was "one man killed and scalped." At the Battle of Long Island the regiment lost its commander, Lieut.-Col. Grant, and, in rescuing his body, the adjutant (afterwards Gen. Sir John Doyle) greatly distinguished himself. It was also present and took part in the actions of White Plains, Fort Washington, Princeton, and Brandywine.

But the crowning distinction of its service in the Revolutionary war was gained at Germantown. During the retreat of the British early in the day, six companies of the Fortieth flung themselves into the Chew House, which they held, notwithstanding all the efforts of Washington to dislodge them, until the British had time to form and drive back our troops. In commemoration of this action a medal was specially struck and presented by the colonel of the regiment to the officers and men. It bears on one side a representation of Chew House, surrounded by American troops, with cannon firing upon it, and on the other side the words, "Germantown, Octr 4, 1777," encircled by a laurel wreath. After the battle of Monmouth Court-house, in which the repulse of our troops is ascribed by Gen. Clinton, in part, to "the good countenance of the Fortieth Regiment," it was sent to the West Indies along with the expedition for the conquest of St. Lucia. In 1781 it returned to Staten Island, and soon after was detailed for service in Gen. Arnold's raid on New London. With the Fifty-fourth it made the brave and sanguinary assault on Fort Griswold, losing eighty-six men killed and wounded, including its commander, or nearly a fourth of its number. Upon his successor, Major Stephen Bromfield, still rests the grave suspicion of having murdered the gallant Col. Ledyard at the moment of the surrender of the latter's sword. Mr. W. H. Harris, in his work 'The Battle of Groton Heights,' with very ingenious though not conclusive arguments, endeavors to prove that the infamous deed is to be laid to the charge of Capt. Beckwith of the Fifty-fourth Regiment. When the latter, some years after the war, was accused of the crime, he indignantly denied it, and is said to have produced documentary evidence to prove his innocence.

On the 25th of November, 1783, Evacuation Day, the regiment embarked for England, the officer who commanded it at Germantown, Lieut.-Col. (afterwards Gen. Sir Thomas) Musgrave being the "acting brigadier and commandant of New York," the last English officer to serve in this capacity. At this time it was quartered on "Laurel Hill in York Island," its strength being 242 officers and men. Want of space prevents our following the fortunes of the regiment during its service in Holland, the West Indies, in Egypt (where it distinguished itself at Abukir and Alexandria), and in South America, whence it returned with Montevideo to be inscribed on its colors. In the Peninsula it was engaged in seventeen battles and sieges, winning four honors, but losing in killed alone 315 men. In November, 1814, the Fortieth sailed for Madeira with sealed orders, and, upon these being opened, to New Orleans to reinforce Sir Edward Pakenham. The mouth of the Mississippi was reached on the 9th of January, and on the two following days the men were sent up the river in launches. The news of the British defeat met them on their way, and they returned to their transports. The account of the subsequent proceedings of the British fleet and army is taken by Capt. Smythies from the manuscript diary of one of the officers of the regiment, Lieut. Hugh B. Wray. It differs in such an extraordinary manner from the official reports, both of the English and the American commanders, that we quote it in full:

"7th February.—We just received orders to weigh and proceed, in two divisions, to attack (it is supposed) Fort Mobile, which is reported amazingly strong—we are now off. We are to go as far as possible in these ships, and then proceed in small boats. I trust we may succeed, and, indeed, I have no doubt. One division, consisting of the 95th, 7th, and *old 40th*, are to make the first attack, and the other, under command of the senior officer of the second brigade, to support us.

"12th February.—We are now as far as the large ships can go, and the small boats are all ready—some off. We are to be commanded by Gen. Lambert, and expect to be close under the fort by morning. We this moment arrived —10:06 A. M.—on our island (called Dauphine), within two small miles of the fort we are to *take* in the morning.

"13th February. — Last night, about 12 o'clock, one of our corvettes, with two hundred Indians, attempted to storm the fort, but, unfortunately, in the dark, the vessel grounded, and our sailors were obliged to blow her up. The explosion illumined the whole bay. The Indians were made prisoners and, of course, all failed. We, as yet, have received no orders to move.

"14th February.—Last night we received orders to be under arms before daylight, and I am now before the fort, in our bivouac, out of range of shot. The fellows are pelting away shot and shell like the mischief. This morning I came off a working party, when we were close enough. We have not lost many men.
